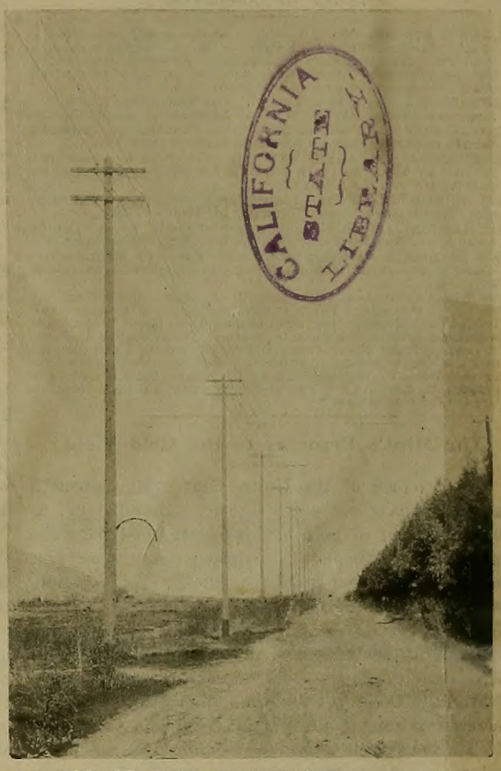
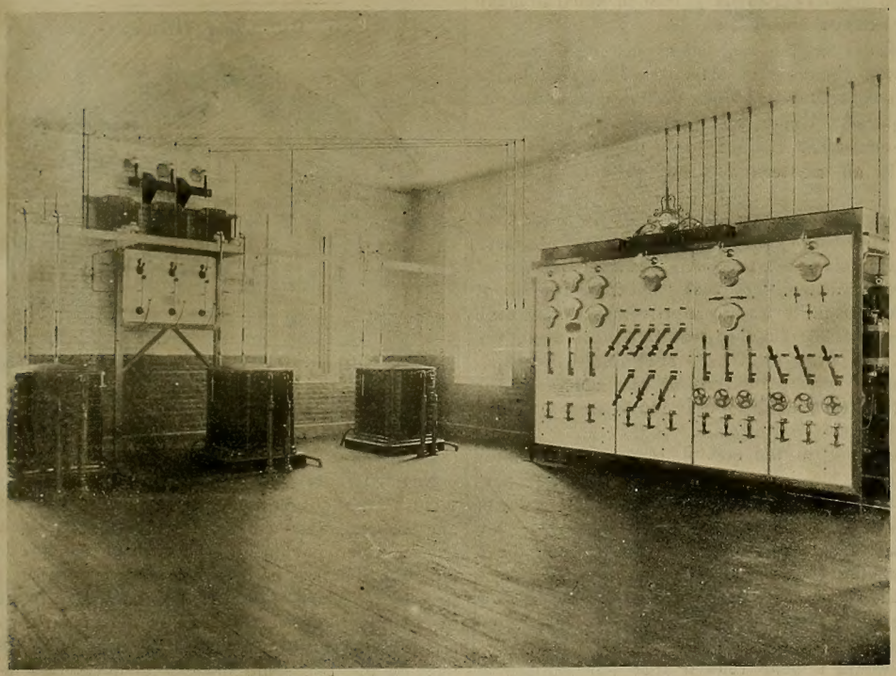
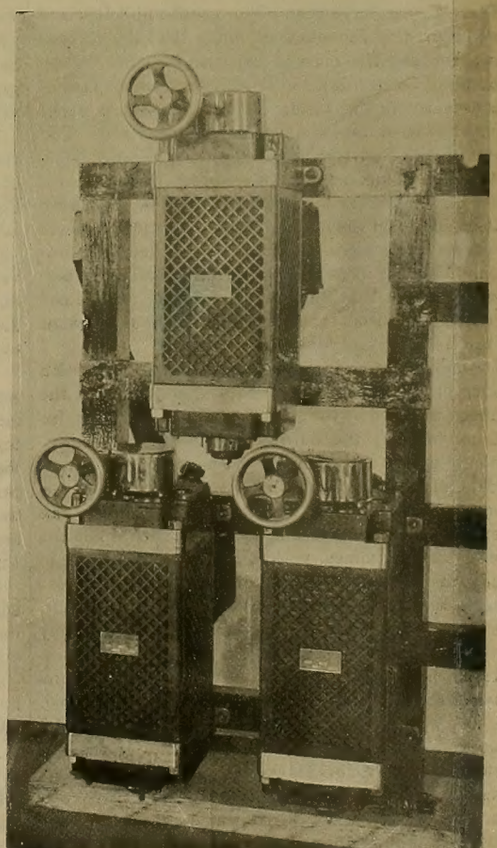
THE RIVERSIDE TRANSMISSION PLANT—VIEW OF COUNTRY THROUGH WHICH LINE PASSES. (See page 8.)



METHOD OF LINE TRANSPOSITION. (See page 8.)



THE SUBSTATION SHOWING LIGHTNING ARRESTERS, HIGH POTENTIAL SWITCHBOARD, TRANSFORMERS AND THE DISTRIBUTING SWITCHBOARD. (See page 8.)



POTENTIAL REGULATORS IN SUBSTATION. (See page 8.)

African Gold Yield.

The output of gold from the mines of the Rand, in spite of the obstacles complained of, caused by the Boer Government, is increasing faster and has been since the beginning of the year than ever before. The returns for May show a yield of 248,305 ounces. In January the returns were 209,832, February 211,000, March 232,067 and April 235,699 ounces. The total for the first five months of 1897 was therefore 1,136,902 ounces, against 860,863 for the corresponding period of 1896. At this rate of increase the yield for the present year would reach 2,800,000 ounces, or $56,000,000. That this increase of yield has come about in spite of the desertion of Africa as a field for investment by the London investor and in the face of local troubles in the Rand says much.

MINING AND SCIENTIFIC PRESS.

ESTABLISHED 1860.

Oldest Mining Journal on the American Continent.

Office, No. 330 Market Street, San Francisco, Cal.

ANNUAL SUBSCRIPTION:

United States, Mexico and Canada..... $3 00
All Other Countries in the Postal Union..... 4 00

Entered at the S. F. Postoffice as second-class mail matter.

J. F. HALLORAN.....General Manager

TO THE PUBLIC.

No one is authorized to solicit business for this paper unless in possession of proper credentials and regularly numbered and stamped blank subscription receipts.

San Francisco, July 3, 1897.

TABLE OF CONTENTS.

ILLUSTRATIONS.—The Riverside Transmission Plant—View of Country Through Which Line Passes; Method of Line Transposition; The Substation Showing Lightning Arresters, High Potential Switchboard, Transformers and the Distributing Switchboard; Potential Regulators in Substation, 1.

EDITORIAL.—African Gold Yield, 1. Our New Office; The Mint's Error as to the Gold Yield; Will the Assessment Clause Hold? 2.

MINING SUMMARY.—From the Various Counties, of California Nevada and Other Pacific Coast States and Territories, 6-7.

ELECTRICAL PROGRESS.—The Riverside Transmission Plant; Drilling by Electricity; Illegal Practice of Medicine; Sodium-Gold Alloys with the X-Rays, 8.

SCIENTIFIC PROGRESS.—Liquefying Fluorine Gas; An Ergometer; Tin in Canned Goods; An Alloy of Silver and Zinc, 8.

MECHANICAL PROGRESS.—The Largest Swing Bridge; Use for Scrap Mica; Nail Production in 1896; Weighing Sky Scrapers, 9.

THE MARKETS.—Eastern and Local Markets; Mining Share Market; Sales in San Francisco Stock Board; Notices of Assessments, etc., 22-23.

MISCELLANEOUS.—Concentrates, 3. Assaying of Gold and Silver; Lead Poisoning; The Waterloo Mining Case, 4. West Australian Gold Mining; Destiny of Mining Investment; Side Lines Adjoining Agricultural Patents; German Deep Mining, 5. Index to Last Volume, 10-11. Coast Industrial Notes; Personal; Recent California Mining Incorporations; Recent Publications Received; Recently Declared Mining Dividends; Commercial Paragraphs, 13. List of U. S. Patents for Pacific Coast Inventors; Notices of Recent Patents, 18.

The Mint's Error as to the Gold Yield.

The Director of the United States Mint about a month ago gave out some figures, semi-officially, as to the product of gold in this country in 1896. The figures for California were without doubt incorrect, and will be changed when the official report is published; but in the meantime a great deal of harm is being done to California. The returns of the United States Mint for California, as sent in by the statistician to Washington, show a yield of gold for 1896 of $17,181,562.70; yet the semi-official announcement referred to gave the output of California in gold as $15,235,800, which is about one hundred thousand dollars less than the amount returned by the same authority for 1895.

These figures have been given great publicity, and it will remain in the minds of many that the figures last given are the correct returns for the bullion product of California; and it will show on the face of it a decrease in the yield. In this respect a great injury has been done that cannot be repaired. The worst of it is that these figures when given out, being in the way of fresh news, have been given a much wider circulation by the press than will be any later statements from the mint, or any corrections made by others. Newspapers published in other gold producing districts have been vigorously calling attention to the fact that the California gold yield is not increasing and that this State will soon lose prestige as the Golden State.

It would seem to those who are at all familiar with mining in California hardly necessary to say that the figures published by the mint director were wrong, for it is patent that the output of gold was increasing, not only by the reopening of old mines or new mines in old districts, but that there was a large increase from new districts, and in no part of the State has there been any considerable falling off or important closing down of mines, with the single exception of Calaveras county, where a fire closed the largest mine in the State for several months. As a result, the output of Calaveras county was considerably lower for 1896 than for 1895.

In Kern county a large increase was expected and returns show it to have amounted to about $350,000. So, too, with the opening up of mines in San Diego county; a large increase was expected. In the old districts of Nevada, Tuolumne, Mariposa, Trinity, Amador, Siskiyou and El Dorado counties there was increased activity, and there was a greater number of stamps falling and a larger output of ore, and it was expected that the returns would show a large increase in the bullion yield. It is from these counties that the increase comes.

Year by year the means of obtaining accurate information from the mines are increasing. If the Director of the United States Mint cannot take for his authority his own statistician and the State Mining Bureau, where could he get data that would be at all reliable from any other source? No authorities except the United States Mint and the State Mining Bureau gather these statistics. If these are not correct, or approximately so, there certainly are no other sources worth consideration.

Will the Assessment Clause Hold?

Considerable opposition is manifested toward that clause in the new law of California as to mining locations which requires that $50 worth of work must be done within sixty days after the date of discovery. Opposition has been manifested in Utah to a similar clause in the new law there, and an attempt will shortly be made to have this declared to be in conflict with the statute of the Federal Government, which refers to the amount of assessment work it is necessary to do to hold title. Strange as it may seem, although similar provisions have been incorporated in State and Territorial laws for years, the question as to whether they are in conflict with the Federal statute does not seem ever to have been brought up in a court for determination, except in the Supreme Court of this State in 1882, and then in reference to the older Federal statutes.

This was the case of the Original Company vs. the Winthrop Mining Company (60 Cal., p. 631). The local rules of the district required that work should be done every sixty days on the claim, while the old law of Congress required that $10 worth of work should be done each year for each 100 feet along the vein.

The attorneys for the appellant stated that "the Court below held that there is no conflict between these acts of Congress and the local rules and regulations then in force in the district where the mine is located. But these provisions plainly appear to us irreconcilable. That the acts of Congress are the paramount law is too plain for argument. Under the acts of Congress above cited appellants had until the first day of January, 1875, in which to make the first annual expenditure."

Attorneys for the respondent held that "under the acts of Congress of May 10, 1872, a compliance with the local laws and rules of the mining district are required. Under this provision the local law cannot contradict, but may add to the act of Congress in all matters not inconsistent with the act."

The Court in its opinion says: "We think that the Court erred in charging the jury that a locator of a mining claim must not only observe the law of Congress which requires that 'ten dollars worth of labor shall be performed or improvements made each year for each one hundred feet in length along the vein until a patent shall have been issued therefor,' but also the local regulations of the miners of the district, which require 'that work shall be done every sixty days on the claim.'

"According to the law of Congress, a locator would forfeit his claim if he did not each year perform work or make improvements of the value of ten dollars for each hundred feet of the vein. By the local regulations, he would forfeit it if he did not perform some work on it every sixty days. It seems to us that there is a clear conflict between the law and the regulations. And if there is, it is conceded that the law must prevail."

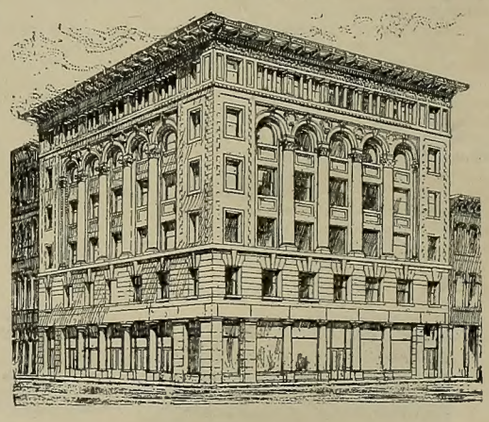
So it would appear that if this question should come before the Supreme Court of California again, unless it reversed this former ruling, the clause requiring fifty dollars worth of work to be done in sixty days after discovery would be declared to conflict with the Federal Statutes, and, as they are paramount, would have to give way.

However, the question will have to be finally decided, to affect the different States and Territories interested, by the Federal Courts. The United States Supreme Court has only inferentially recognized the right of local districts or State legislatures to make provisions for work on locations in addition to that required by the act of Congress. In the case of Erhardt vs. Boaro (113 U. S. Reports, p. 527) it would appear from the decision that the Supreme Court was inclined to admit the right of States or districts to require extra work.

Justice Field, who rendered the decision, says: "The statute of Colorado requires that the discoverer, before a certificate of location is filed for record, shall, in addition to posting the notice at the point of discovery, sink a shaft upon the lode to the depth of at least ten feet from the lowest part. Before this work could be done by the plaintiff the ground claimed was taken possession of by the defendants, the stake at the point of discovery, upon which the notice was posted, was removed, and Carroll was thereby and by threats of violence prevented from re-entering upon the premises and completing the work required to perfect the location. * * * *

"In all legislation, whether of Congress or of State or Territory, and by all mining regulations and rules, discovery and appropriation are recognized as the sources of title to mining claims, *and development, by working, as the condition of continued ownership, until a patent is obtained.* And whenever preliminary work is required to define and describe the claim located, the first discoverer must be protected in the possession of the claim until sufficient excavations and development can be made, so as to disclose whether a vein or deposit of such richness exists as to justify work to extract the metal." * * * "And the laws of the United States do not prescribe any time in which the excavations necessary to enable the locator to prepare and record a certificate shall be made. That is left to the legislature, which, as we have stated, prescribes sixty days for the excavations upon the vein from the date of discovery, and thirty days after for the preparation of the certificate and filing it for record. In the judgment of the Legislature of that State this was reasonable time." * * * "A mere posting of a notice on a ridge of rocks cropping out of the earth, or on other ground, that the poster has located thereon a mining claim, without any discovery or knowledge on his part of the existence of metal therein, or in its immediate vicinity, would be justly treated as a mere speculative proceeding, and would not in itself initiate any right."

Our New Office.



Nearly twenty years ago the MINING AND SCIENTIFIC PRESS outgrew its rooms, corner California and Sansome, and with its allied interests took the entire upper part of the block bounded by Front and Market streets. It has now outgrown the building it so long occupied, and this issue appears from our new offices, 330 Market street. We have leased for a term of years what we consider the best part of the handsome modern building just completed at the intersection of Battery, Bush and Market streets, No. 330 Market, an illustration of which appears above. The building is up-to-date in every particular, was built by the Clark estate, under the supervision of Mr. Edw. Swain, who was the architect, and that part of it occupied by the MINING AND SCIENTIFIC PRESS was built specially for the use of this paper. It is intended that, as in the past, this office shall be headquarters for mining information, and mining men resident or visiting the city are invited at any time to make use of its facilities.

Concentrates.

A LEDGE of onyx was discovered last week near Vollmer, Idaho.

THE plan to build a smelter at Vancouver, B. C., has fallen through.

THE gold yield of Victoria, Australia, during May amounted to 66,604 ounces.

THE Le Roi mine at Rossland, B. C., has increased its shipments to 180 tons a day.

THE Banner Mining Co. in the Florence district, Idaho, are to erect a 10-stamp mill.

PLATINUM to the value of about $17,000 was produced in New South Wales during 1896.

THERE are about 100 men in the revived Meadow Lake district in Nevada Co., Cal.

SPOKANE people have bonded the Queen Esther mine at Cheney, Wash., for $25,000.

LANE CITY is a new mining town established at the Chainman mines, near Ely, Nevada.

MINING PROPERTIES all over the coast are being opened up, in most cases, by their owners.

THE Anaconda Copper Mining Company of Montana turns out about 5000 tons of ore daily.

EASTERN people have begun negotiations for copper property on Michal creek in Washington.

A COPPER strike has been made in the Amazon district near Basin, Montana, in the Scioto mine.

A RECENT cleanup at the Cariboo hydraulic mine, in British Columbia, yielded gold valued at $71,414.

THE monthly payroll of the Mountain Copper Company at Keswick, Shasta county, Cal., is about $40,000.

THE Comet, a prospect at Gold Creek, Nevada, has been bonded by T. A. Bennett and others for $22,000.

E. C. MITCHELL is about to erect a 10-stamp mill at the South Fork mine, at Graniteville, Nevada Co., Cal.

THE steamship City of Topeka is down from Alaska with $70,000 in bullion from the Alaska-Treadwell Mining Co.

THE Minnehaha mine, in the Randsburg, Cal., district, has been bonded by J. W. Rogers and F. N. Hubbell for $15,000.

THERE was exported from New York, in the week ending April 8, to Europe 1,840,000 ounces of silver valued at $1,140,800.

THE tailings at the old mill at the Chainman mine, in White Pine district, Nevada, are to be worked by the cyanide process.

FOUR PUMPS have been manufactured and will be set up immediately at Leadville to drain the down-town mining district.

THE Boston & Montana Consolidated Copper and Silver Mining Company's mines in Montana produce about 1200 tons a day.

IT is reported that placers have been found two miles north of Randsburg, Cal., which are as rich as those at Goler.

THE Montana Smelting and Refining Company is going ahead with the erection of its plant at Twin Bridges, Montana.

IT is estimated that there have been 15,000 mining locations recorded in Josephine county, Oregon, since the first one was made in 1863.

NEGOTIATIONS are on foot in London to transfer the Golden Cache free milling gold mines in the Lillooet district, B. C., for $3,000,000.

THE statement of the Parrott Company at Butte, Montana, shows net profits for the year 1896 of $412,377.66 from their copper properties.

HYDRAULIC WORK has begun at Gold Creek, Nev., under the direction of C. H. Cook. The Empire mine there has been bonded for $25,000.

A NEW discovery of coal deposits, said to be of good quality and extensive, has been made in the western part of Box Elder county, Utah.

THE Exchange group of mines on Springer creek in the Slocan district, B. C., has been bonded by Sir Chas Tupper of Ottawa for $42,000.

THE mill at the Fortuna mine in Arizona, with twenty stamps weighing 1350 pounds each, crushes eighty tons daily, or four tons per stamp.

THE Anglo-Mexican reports that the output for the month of May amounts to: Bullion, $81,700; concentrates, $1300; 1780 tons, 29 days' run.

ACCORDING to the Spokane *Spokesman-Review*, the owners of Reco mine of the Slocan, B C., have sixteen cars of ore in transit which will average $3500 a car.

F. AUG. HEINZE's application to the Canadian Government for a subsidy of $8000 a mile on a railroad from the Columbia river to Pendleton will stand over for a year.

THE mineral export of Tasmania for May was valued at £73,171, and dividends were declared amounting to £13,485, and a total for the first five months of 1897 of £55,946.

FOR the convenience of our readers, the index to the contents of the six months' issue of this paper, from January to June, 1897, inclusive, appears on pages 10 and 11 of this issue.

LARGE powers have been granted to the Yukon Chartered Company of England to explore in what is known as the Cassiar concession, and the advance party has started for the fields.

IN the hanging wall of the Daisy mine at Mercur, Utah, there is about 18 inches of a fine quality of fireclay, some of which is being used in the assay offices to manufacture crucibles.

THE Grand Central of Mexico reports for May: Thirty stamps ran 28 days, crushing 4500 tons; bullion shipped, £7000; concentrates estimated to be £3800; expenses, £6000; profit, £4800.

UP to May 22 the dividends declared by South African mines this year amounted to £358,939 on a total capital of £1,379,594, or over 26 per cent. However, this came from only thirteen mines.

THE Little Sunflower reservoir at Gold Creek, Nevada, contains about 300 million gallons of water and hydraulicking has been commenced. When filled the reservoir will hold 820 million gallons.

IN the Senate last Tuesday by a vote of thirty to twenty-three the committee tariff rates of 1⅛ cents per pound on lead in ore was agreed to. The duty on pig lead is increased from 2 to 2¼ cents per pound.

THE exports of ore from the Kootenays for the week ending June 19 was 1,145 tons; the total so far for 1897 is 26,986 tons. The value of the output of ore and bullion and matte up to that date is given at $3,339,723.

DURING the last two years nearly 100 new papers have been started up, and in some cases old papers have been revived. Of the latter, the most notable is the resuscitation of the *Times-Review* at Tuscarora, Nev.

THE gold output of the Indian mines for May was 32,099 ounces, an increase of 674 ounces as compared with the preceding month, and an increase of 5259 ounces as compared with the corresponding month of 1896.

A NEW strike has been made in the Stonewall mine near Julian, San Diego county, opened and worked by the late Governor Waterman. The mine has been idle for a number of years since the ore bodies pinched out.

LAST week's ore shipments from Rossland, B. C., were: Le Roi, 900 tons; War Eagle, 250; Iron Mask, 80; Columbia and Kootenay, 200; Josie, 95; Cliff, 40. Total, 1455 tons. The I. X. L. milled in the O. K. mill 105 tons.

THE oil producers at Los Angeles have been holding oil up to $1 a barrel, but now the increased production, it is claimed, will increase the reserves largely or force down the price. The local demand takes 2000 barrels daily.

THE Mount Lyell mine of Tasmania reports for the last half year having worked 34,089 tons of ore and produced 1283 tons of copper matte valued at £84,853. When the additional works are completed, it is expected to treat 500 tons daily.

AN effort is to be made in London to raise funds to build a railroad between Bute inlet, near the north coast of British Columbia, to the village of Quesnelle, Cariboo, a distance of 230 miles. It would be of value to a rich gravel mining country.

THE cost of shipping nine tons of mining material from San Francisco to the Rand, South Africa, lately was about $1000, the Cape charges being eight times as great and the Netherlands railroad, twenty-seven times as great as the American per mile.

THE export of gold from British Guiana from January 1 to May 24, this year, has amounted to $736,522, as against $665,806 for the corresponding period of 1896. The weekly yield, however, would indicate an output for the year much larger than last.

IN Meadow Lake district, Nevada county, Cal., nearly all the mines are bonded to the syndicate which is building the road for transporting the rebellious ores. Although nearly all the known ledges have been taken up many prospectors are going in.

THE Alaska-Mexican reports for May as follows: Period since last return, 31 days; bullion shipment, $33,380; ore milled, 14,369 tons; sulphurets treated, 289 tons; of bullion there came from sulphurets $9593; working expenses for period, $17,901.

THE Salt Lake *Tribune* is unearthing and exposing a number of mining swindles being perpetrated in the East with worthless Utah mines. The old game of giving names similar to well known mines, or locating their wildcats near big properties is the most common in use.

THE Superior Court of Butte Co., Cal., has refused to grant Goodall, Perkins and others an injunction restraining the Golden Feather Co. from making use of the dams and flumes for turning the waters of the Feather river at Morris ravine. The case will now go on to trial.

THE De Lamar of Idaho reports for May: Crushed during the month, 4660 tons; bullion produced in the mill, $44,680; estimated value of ore shipped to smelters, $400; miscellaneous revenue, $155; total produce, $45,235; total expenses, $34,430; profit for the month, $10,805.

NEGOTIATIONS are pending for the transfer to the Scottish Colonial Gold Fields, Limited, of Edinburgh of the properties of the Adams Mining Co., the Cumberland Mining Co., the Slocan Mill Co., the Slocan Tramway Co. and the Idaho mines in British Columbia for about $400,000.

THE Arizona Legislature at its last session passed a bill exempting from taxation for five years new railroads. As one result it is proposed to build a road from Kingman or Hancock into the White Hills in Mohave county. This would enable a number of low-grade gold mines to be worked.

IN the Gregory-Bobtail mine in Gilpin county, Col., a strike of rich ore has been made by the Gold Coin Company, which holds it under a bond and lease. This mine was discovered in 1859 and has been worked ever since and has produced several millions, although of late but little has been taken out.

THE output of copper in the United States for the first five months of 1897 has amounted to about 90,000 tons and is an increase of a little more than 3000 tons over that of the corresponding period of 1896. European demand has taken more than usual and the home consumption has remained about stationary.

THE Bon Accord Placer Mining Company, operating near Bannack, Montana, have proved the feasibility of working gravel with a dredger last season, and now are about to erect a dredge having the capacity to handle 5000 to 6000 cubic yards of gravel every twenty-four hours, to work on Grasshopper creek.

A MORTGAGE for $250,000 bonds has been executed by the Arizona Onyx Company of New Jersey to the Continental Trust Company of New York, covering the Big Bug onyx mines in Maricopa county, Arizona, recently purchased by the mortgagors for $50,000. This step is to secure a large working capital.

THE Alaska-Treadwell reports for June 23,596 tons ore worked, averaging $2.84 per ton. There were also 372 tons sulphurets treated, of the value of $21,166. The total bullion product for the month was $67,043. The expenses were $28,981. In May the ore averaged $2 per ton, and the total bullion product was about $41,000.

AT Brown's valley, Yuba county, Cal., 2000 inches of water taken from the Yuba river by the irrigation district authorities have been leased for fifty years by the Dannebroge Mining Company, and they are now putting in an electric light and power plant to supply their 20-stamp mill and mine and other properties in the neighborhood.

THE Montana (Drum Lummon) of Montana manager reports that the 50-stamp mill, which resumed operations on May 1, crushed during that month 3500 tons of ore, which contained gold 1720 ounces, and silver 12,730 ounces, valued at $40,800. Working expenses on revenue account, $26,800; outlay on developments, $5400; sundry, $300; total, $32,500; estimated net result, $8300.

IN the *Pall Mall Gazette* of London lately it was stated that "a syndicate of British investors will within a few weeks purchase half a dozen gold mines in Cripple Creek, Col., and two lines of railroad connecting the mines with the nearest trunk roads, thus giving it control of the shipping facilities to the East. The railroads are the Colorado Midland and the Midland Terminal."

TWO MEN charged with kidnaping Captain William Meikle, superintendent of the Niagara mine in Sierra county, Cal., last December, because he was employing Chinese, were last week found guilty of false imprisonment and one sentenced to one year and the other to six months imprisonment in the county jail. Another defendant, who has been confined in jail for six months, was acquitted.

THE Geldenhuis Estate, on the Rand, South Africa, which made a profit for the year ending March 31 of £70,123, reports that the 120-stamp mill crushed 189,598 tons of ore. The cost per ton for the year, including development work and all expenses, was $4.29, against $4.40 for the previous year. The cost of cyaniding 127,000 tons was 70.2 cents per ton, against 83 cents per ton for the previous year.

LATELY a shipment of ten tons of ore was made from the San Juan country in Colorado valued at 40 cents per pound, or about $800 a ton. In referring to this the Cripple Creek *Mail* says that shipments of more than ten tons of even more valuable ore have been made from the Doctor, Elkton, Smuggler, Victor, Portland, Independence, Pike's Peak, Garfield-Grouse, Moose and Eclipse mines of Cripple Creek.

GOLD mines in Servia were largely worked in Roman times and in the middle ages, but during the long Turkish oppression mining operations ceased. The richest source of gold known to the Romans was on the river Timok. Only alluvial deposits were then worked, but traces of systematic mining are visible, dating from the sixteen years of Austrian occupation in the last century. They are now being reopened.

THE Lillooet, Fraser River and Cariboo Company reports for the Lanark mine in British Columbia for May: Concentrator has been running continuously for twenty-five days, 3122 tons treated; have shipped 430 tons of concentrates. Six days' delay caused by a breakage to the pumps and landslide. Estimated profit $35 per ton (say, total net profits for month of May, $15,050. Estimated profit for the month of June, $20,000, can be increased to $30,000 subsequently.

FIFTY producing mines in April made up the total output of the Rand, South Africa. These crushed with a total of 3412 stamps working on an average nearly twenty-eight days. Of these the 907 stamps at thirteen properties in the Association of Mines crushed on an average 4.73 tons per stamp per day. The thirty-seven mills in the Chamber of Mines with 2505 stamps crushed an average of 4.45 tons per stamp per day. The twenty stamps in the Langlaate estate will made an average of 6.41 tons per stamp per day.

DEEDS have been filed transferring some thirty claims owned in San Diego county, Cal., by the Golden Cross Mining and Milling Company, to a syndicate of Salt Lake and California capitalists, for a consideration named of $1,000,000. For some time, under the management of the receiver, W. W. Stewart, these mines have been paying a profit of some $30,000 a month. There are 150 stamps on the property, and it is stated by the management that a large cyanide plant will probably be erected soon to work the tailings.

OF the loss of copper by drainage from the Bingham, Utah, copper mine, the *Bulletin* of that place says: "One of the copper springs runs a little over one miner's inch of water, or about 100 pounds, per minute, carrying one-fourth of 1 per cent copper, and each minute four ounces of copper runs to waste from this one spring alone. In all probability the stream was running at the dawn of the Christian era—say, 1900 years ago—and by computation we find that during this period 268,831,000 pounds of the red metal have gone to waste—enough to make a belt for the world 8 inches broad by one-sixteenth thick, and have over 4,000,000 pounds left for buckles and bangles."

AN Englishman writing from London to a correspondent says: "If any one had during the first days of the depression in Africans and Australians come over with good California properties, he could easily have placed them on a reasonable basis. But now I have changed my opinion as to where the property should be located, and have seriously changed my estimate of the California mine owners' aptitude for business. Thirsting for capital, they no sooner see it approach than they drive it away by asking several times more than they had intended. Get an option on a well-opened mine in Kootenay, with good reports, and you have something you can sell our friends. British capital is very much inclined to follow the British flag, and always will."

HENNEN JENNINGS in his evidence before the mines commission in South Africa compared the cost of working the El Callao mine in Venezuela with those of Africa. At first it was worked by utterly inexperienced people, but later in its history there were thirty-one companies running 758 stamps. Now the lode is practically worked out, only ten stamps running on the fields. The gross yield from the mine has amounted to £5,457,432, while the dividends have only amounted to £1,940,478, in spite of the great richness of the ore. This paucity of return must be attributed to the high costs, which during the first thirteen years were 149s 2d per ton, and have averaged 58s 8d during the period of the lode—the lowest level being reached in 1891, when the figure was 39s 9d.

THE Comstock Tunnel Company (Sutro tunnel) has failed to take action on the proposition submitted to it by the directors of the American Flat Development Company, and the claim owners all along the line of the proposed tunnel extension, from the Alta to the Rock Island, have generally declined to accept the terms proposed by the Development Company. On this subject the *Enterprise* says: "Notwithstanding all this, the proposition has by no means been abandoned, and the directors of the company are as enthusiastic of success as ever. They say the mines of the American Flat will be drained in the course of a few years. The plan of the tunnel extension from the Alta to Rock Island has not been abandoned, but other plans are now under consideration, one of which is a tunnel from the river at Dayton through Silver City into the American Flat country, and still another is to run a tunnel from the Dayton mine at Silver City to the Rock Island shaft."

Assaying of Gold and Silver.

By JACOB B. ECKFELDT, Assayer of the United States Mint at Philadelphia, Pa.

Assay of Gold.—Gold received at the mint for refining or coinage, either in the manufactured or native condition, is of every variety of fineness, the alloy in a majority of cases being silver, with a smaller proportion of base metal.

In some cases of low-grade gold the alloy is largely composed of copper. The object of the assay is to ascertain these different proportions, both in order to base the calculations for value and for subsequent minting operations. For this purpose a small sample is cut from each bar after melting. The fineness of this sample must, if the melting has been properly conducted, be the fineness of the gross amount.

The fineness of gold being expressed in thousandths (pure gold being 1000), it has been found expedient in assaying to employ the French system of weights, using the demigramme as a unit of 1000 parts with the decimal divisions to the ten-thousandth of that weight.

The demigramme is rather less than 8 grains. From the sample, after it has been laminated for convenience in chipping, there is accurately weighed 1 demigramme on the assay balance.

This assay balance is so constructed as to be of the utmost precision and delicacy, and so fine is the adjustment that it is sensitive to the fiftieth of a milligramme.

To the gold, after being accurately weighed, there is added sufficient fine silver to make about twice (according to one system) or thrice (according to another method, now less used) the estimated amount of silver which may be contained in the alloy, extreme care being necessary that the amount of silver added varies as little as possible from this proportion, as in any marked divergence the result would be liable to inaccuracy. Practice enables an expert to judge of the fineness of gold within a few thousandths, thus securing the proper basis for the addition of silver. It is needless to say that the added silver is accurately weighed.

If the gold for assay is of low fineness, or contains a large amount of base metal, where it is impossible to estimate the quality, it is customary to make a preliminary or approximate assay as a basis or guide for a subsequent rigid assay.

The gold and silver, each having been weighed, are inclosed in a piece of lead foil about ten times the weight of the assay. A very little copper is added, merely to assist the cupellation. These are now ready for what may be termed the first part of the operation, that of removing the copper and other base metal. This is effected by the cupelling process.

The cupel is a small, shallow cup made from the ash of bones or the pith of animal horns. It possesses the quality of absorbing the oxides of the metals, but not the metals themselves.

The bone or pith is first well burned in open air and thoroughly ground, after which it is moistened with water and pressed in a mold to the desired shape.

The assay furnace is oval in cross section, about 1 foot in height, made of fire brick. Extending across the furnace about the center is what is known as the "bridge" (that is also made of fire brick), and is designed to support the muffle. The muffle is the oven for the reception of the cupels. It is flat-bottomed, with an arched top, its length nearly corresponding to the depth of the furnace. The modern furnace is arranged for burning gas; the flame completely surrounding the muffle subjects it to a high heat, easily controlled and regulated.

The front of the furnace has an arched opening corresponding to the muffle; through this opening the cupels are introduced by a long pair of spring tongs. When in operation the muffle is nearly closed by a door, allowing, however, the entrance of a regulated current of air, which, passing over the assay, oxidizes the lead and base metals, their oxides being absorbed by the cupel.

At the back of the muffle is a slit or opening, which allows the exit of the unabsorbed fumes formed by the oxides of the metals, which are not absorbed by the cupel.

The furnace having been properly heated, the cupels are placed therein and brought to a uniform temperature of which the assayer must judge from experience. Each leaden bullet with its contents is then placed in its cupel, and the furnace closed. The lead in which the gold and silver has been inclosed is rapidly changed to a fluid vitreous oxide, which, exerting an oxidizing effect upon the base metals in the gold, causes their absorption into the pores of the cupel.

The lead likewise helps to form a more uniform alloy of the gold and silver.

The precious metal is allowed to remain in the cupel until all agitation ceases; it then presents a bright surface, which indicates that the base metals have been oxidized and absorbed.

The cupel is now allowed to cool gradually, and the button of pure gold and silver detached. The next step in the operation is the extraction of the silver, which is effected by digesting the rolled-out button in nitric acid.

The object of the addition of fine silver previous to the cupellation is to make an alloy, in which the particles of gold will be so far separated from each other that they may not protect any part of the silver from free action of the acid. A total extraction of the silver, both that which has been added and that which was originally in the alloy, is thus insured, within the limit hereafter described.

The button is hammered, annealed, and rolled to a thin strip, to furnish a larger surface for the action of the acid. This strip is loosely coiled into a small roll, technically termed a cornet.

The cornet is now ready for the process of separating the silver. If three parts of silver have been added in making up the assay, the action of the acid has to be conducted more slowly (to lessen the danger of breaking the cornet) than when but two parts of silver have been used; consequently, a weaker acid is employed.

The cornet is introduced into a small vessel or flask, containing 1¼ fluid ounces of nitric acid at 22° of Baume's hydrometer; heat is then applied, either by a sand bath or gas jet, and the acid boiled for ten minutes.

The resulting solution, which contains nitrate of silver, is poured off, and three-fourths of an ounce of stronger acid, at 32° Baume, is substituted. This is boiled for ten minutes, after which the operation is again repeated with acid at 32°.

When the boiling or digestion is completed, it is presumed that the whole of the silver has been removed. The acid is accordingly poured off, and the cornet well washed with pure water. It is then deposited in a small clay crucible, which is placed in the muffle, that the gold may be dried and annealed.

The cornet (which is now fine gold) is brought to the assay balance and its weight ascertained in thousandths of a demigramme. The number of thousandths which it weighs expresses the fineness of the original sample in thousandths.

If but two parts of silver have been used in preparing the assay, the cornet is introduced into the flask containing 1 ounce of nitric acid at 32° Baume's hydrometer. This acid is boiled for ten minutes, when it is poured off and replaced by another equal charge of acid of the same strength, in which the gold is again boiled the same length of time. After the second boiling has been completed, the cornet is washed, dried, annealed, and weighed, as in the preceding case.

By subjecting another demigramme of the alloy to the cupellation process, without adding any silver, the base metal alone is removed. The loss gives the proportion of base metal, and, the fineness in gold being known, the amount of silver is ascertained by difference. It must equal 1000, less the sum of gold and base metal.

It is customary with every assay or set of assays to make one or more of pure gold, as a test assay or proof of the work, to detect any possible inaccuracy from overheating, too prolonged boiling, and particularly to afford the necessary correction for "surcharge," which will be explained at the close.

With every set of assays for the determination of base metal there is also a proof assay made. For this purpose gold of a standard fineness is used when the assays are of native gold, or in other cases when the proportion of alloy is not very large. A special proof, however, is made for every such assay. The proof, by calculation from the approximate assay, is so composed that when melted it will make an alloy similar to the sample for assay. Its exact proportion of base metal being thus known, any deviation from this proportion shown by cupellation becomes apparent. By this deviation the necessary correction is made upon the result of the regular assay. In an assay of gold containing platinum, as in dentist plate, the amount of silver in the alloy cannot be accurately determined by the cupellation process, for the reason that the platinum, being a nonoxidizable metal, it is not absorbed by the cupel, but is returned in the button as precious metal.

(*To be Continued.*)

Lead Poisoning.

Dr. Wegener of Clausthal has published in the German Quarterly Review of Public Health an important memoir on lead poisoning. Lead miners are in no way liable to lead poisoning. The danger only occurs when the ores are smelted. It then results entirely from the formation of lead dust and of volatile lead fumes. In order to obviate the danger it is, therefore, necessary to prevent lead fumes from being formed, or to conduct them away as rapidly as possible. It is satisfactory to note that much has been done of late years to improve the sanitary condition of lead works, the result being that there has been a notable decrease in lead poisoning. This is well shown by the following statistics collected at the Tarnowitz Lead Works:

		All illnesses.		*Lead poisoning.*	
Year.	*Workmen.*	*No.*	*Per 100 men.*	*No.*	*Per 100 men.*

1892	579	131	22.6	36	6.2

The Waterloo Mining Case.

Written for the MINING AND SCIENTIFIC PRESS.

The Calico Mines of San Bernardino county, Cal., after various vicissitudes, passed mainly into the hands of two separate ownerships—on the one side by T. S. Doe of San Francisco, and on the other the Waterloo Mining Co. of Milwaukee.

When the claims of these separate ownership adjoined arose a number of conflicting interests, which resulted in long and expensive litigation. The most important of these suits, so far as the miner is concerned, was the conflict between the Silver King mine, owned by the Waterloo Co., and the Oriental No. 2, owned by Mr. Doe. This suit had its inception in a contract between the prior owners of the Oriental No. 2 ground and the prior owners of the Silver King mine, by which the Silver King owners were given the right of way to run a tunnel through the Oriental ground to reach their own mine, on certain conditions. At this time the miners of the district considered the ore deposits as merely superficial, and gave but little thought to any extra lateral rights which they might have. In the subsequent developments, however, of the Silver King mine the ore was followed to considerable depth and beyond the side line and into the Oriental No. 2 ground. After about $300,000 or $400,000 had been extracted from the Oriental No. 2 ground, Mr. Doe brought suit in the Superior Court of San Bernardino county for the value of the ore extracted from that ground. This brought up the question of the extra lateral right of the Silver King mine. The Silver King owners came into court with elaborate plans and models to try to prove that they had on the Silver King ground a lode on similar lines as was contended in the celebrated Eureka case. That this lode had a well-defined hanging and footwall, and that the ore which they had extracted was within these boundaries, and had been followed down continuously from their croppings, the counsel for Mr. Doe denied their right to justify. They contended that whether they had a vein or lode, or not, they had no right to trespass upon the ground of another because the end lines of their claim were not parallel. At this time the Silver King was not patented and their title rested upon their original location, which had widely divergent end lines. The Court took the view of counsel for Mr. Doe, and the jury were instructed to award the extent of damages.

An appeal was taken from this decision to the Supreme Court of the State, where the ruling of the lower court was reversed and the case sent back for re-trial on its merits.

Pending this decision the Silver King owners, about 1000 feet westerly from the original points of contention, again trespassed upon and extracted ore from the claims owned by Mr. Doe, who stopped them by a temporary injunction issued by the U. S. Circuit Court of Southern California. The testimony in this case was taken before an examiner of the court, which permitted all the testimony bearing on the merits of the case to be heard. Practically the same points were involved as in the original suit, with the exception that in the meantime the Silver King owners had obtained a United States patent, or Land Office receipt for patent, showing parallel end lines for the greater portion of their original location.

The experts for the Silver King owners, following the lines of the Eureka case, contended that the ore deposits of the Silver King were within a lode having well-defined hanging and footwall boundaries; that the whole mass of rock between these boundaries should be regarded as a lode within which ore might be anywhere found.

The experts for Mr. Doe proved that the ore was found only along the planes of three distinct and independent fissures, constituting three independent veins. The apex of one of these veins, and that from which the ore in dispute had been extracted, was within the surface boundaries of the Oriental No. 2 ground.

The main points therefore which were brought before the Court for decision were:

First—To what extent the non-parallelism of the end lines of the original location would affect the extra lateral rights; and

Second—Whether the ore deposits constituted an indivisible unity, or were several independent and distinct units.

As to the non-parallelism of the end lines, the Court finds that a patent having been issued showing parallel end lines, the presumption is that the Land Office was right in issuing it, as no attack is made on the patent.

It is believed that this ruling opens or leaves open a very wide field of uncertainty as to subsequent and adjoining locators to a faulty location, and that a more radical decision would in the end be of far greater justice to the miner. Space, however, does not permit of a discussion of this subject at this time.

After a careful consideration and thorough knowledge of the facts, it is not seen how the decision could be otherwise as to the constitution of the ore deposit. The question was stubbornly fought by able experts on both sides.

West Australian Gold Mining.

The principal features of the gold fields of Western Australia may be briefly summarized as follows:

1. Vast Extent.—The area of the proclaimed gold fields is over 300,000 square miles, and there are still unexplored enormous tracts into which prospectors have not yet penetrated. The total area of the colony is close on 1,000,000 square miles, and it may be assumed that throughout its whole extent it contains auriferous deposits of more or less value.

2. Barren Nature of the Country.—The greater part of the gold fields consist of a desert, fresh water on the surface being almost unknown, and where water is found it is of a densely saline character. All water for drinking purposes requires to be condensed, and it has only been found possible to penetrate into the country by the establishment of condensers at various points. The exploration and prospecting of the country has, to a great extent, been conducted by the use of camels. Experience has shown, however, that there is a considerable rainfall which can be conserved, also that there are subterranean watercourses and reservoirs throughout the fields.

3. Rapidity of Development.—It seems almost incredible that, in the short space of about three years, 300,000 square miles of gold fields have been opened up, many important towns built in the desert, hundreds of miles of railways built, and numerous stamp batteries erected, some of them in the most distant parts of the interior. It has not been unusual to pay from £60 to £75 per ton for the transport of machinery and stores from the railway terminus to the mines. Labor charges have also been excessive, and this has rendered mining operations most costly. In spite of these difficulties, the returns of the West Australian Chamber of Mines for the month of April last show that 14,452 tons of ore were crushed, yielding 31,957 ounces of gold, equal to an average of nearly 2¼ ounces per ton. Undoubtedly this result bears eloquent testimony to the enterprise and activity of those who have had charge of the development of the mines.

4. Character of the Gold Deposits.—The reefs are of two distinct kinds—(1) quartz veins and (2) composite veins, known in Western Australia as "lode formations." The quartz veins have similar characteristics to those of other countries, but are of exceptional richness, and certainly exceed all previous experience. The gold generally occurs, as elsewhere, in chutes, which vary very much in length and thickness, and the value of any mine working on these veins depends entirely upon the length and thickness of the payable chute. A remarkable feature of these gold fields has been the extraordinarily rich patches of almost solid gold that have been found in detached masses in mines like the Londonderry, Bayley's Reward and others; but a still more remarkable feature is the high average value of many of the reefs over long distances and for great widths. This high average value is not confined to any particular center, but is found throughout the gold fields.

The composite veins of Western Australia appear to be as peculiar to that colony as the gold-bearing conglomerate beds of Johannesburg are to the Transvaal. They chiefly occur in the diorite or diabase, but are not unknown in the granite. No scientific study has been made of these formations up to the present, and they have hardly been explored below the zone of decomposed diorite in which they consist of a light-brown rock of a clayey and talcose character, intersected in all directions by veins of quartz of varying thickness. So far as is known, the more numerous the quartz veins the richer the formation in gold. The transition between these formations and the country rock on each side is often not well defined. Information is wanting as to the behavior of these formations below the decomposed zone. So far as is known at present, they become hard like the enclosing diorite, and contain iron sulphides and tellurium ores, and are equally as rich in gold as in the decomposed zone. Sufficient time has not yet elapsed for the mining companies to sink their shafts into the undecomposed rock, and results will be watched with much interest. These "lode formations" are of great size, are persistent over large areas and their gold contents are, as a rule, very regular, varying in different formations from half an ounce up to many ounces per ton. Extraordinary results have already been obtained from these formations, not from a few tons of ore, but from large quantities and continuous crushings. For instance:

	Tons crushed.	*Gold recovered.*	*Yield per ton. Ozs.*	*dwts*
Great Boulder Proprietary Co.....	21,020	82 612	3	18.60
Lake View Consols.....	11,037	31,173	2	16.11
Hannan's Brownhill Gold M. Co..	2,048	18,424	6	5.00

These results, it must be remembered, have been obtained in the face of the great difficulties already pointed out, with inefficient and inadequate machinery, and by the use of the extremely dense salt water which is alone available. In many cases from one ounce to two ounces of gold is left in the tailings—equal to two or three times the amount contained in the original ore of some of the richest mines of other countries. There seems little doubt that, when sufficient time has been given to allow of the industry being organized, and machinery placed on these formations, a production of gold will take place which will eclipse that from any other part of the world.

5. Machinery and Methods of Ore Treatment.—The specially difficult conditions under which West Australian mining presented itself at the beginning has resulted in a diversity of practice among engineers with regard to machinery and ore treatment, and great attention has been given to dry treatment. The author's opinion is that, so far as the treatment of the ore from quartz veins is concerned, wet crushing and plate amalgamation is the most economical, where sufficient water can be obtained for the process; but for the "lode formation," in which the gold occurs in an extremely finely divided condition, and which also contain a quantity of clayey and talcose material (forming slime), dry crushing is preferable. He suggests that the ore should, as it comes from the mine, be dried, and in some cases partially calcined in revolving dryers. It should then be crushed dry, and the pulp divided into two products by air winnowing, viz.: (1) A product easily percolable. (2) A very fine product or slime. These are then treated by cyanide or bromo-cyanide solution, extracting all the fine gold, and the tailings dealt with by some form of amalgamation. It will be seen that this is a complete reversal of the ordinary method of treatment, and from the author's experience will give better results.

6. Occurrence of Tellurides.—A considerable amount of interest has been aroused by the fact that ores of tellurium have been found in the "lode formations," and as these ores generally occur in formations rich in gold, it has been rather hastily concluded that their value is mainly dependent on the presence of telluride of gold, whereas there is no doubt that many of the "lode formations" in which no tellurium has been detected are as rich, if not richer, than those containing that metal. A considerable amount of the gold occurring with some of the tellurium ores is in a free state, and, as tellurium itself is unattacked by cyanide of potassium, there would seem to be little difficulty in extracting the gold by that means. It is possible that in some cases gold may occur in the form of a telluride of gold, and, if so, it would have to be kept apart for treatment of smelters.—C. E. Moreing's paper read before the London Institute of Civil Engineers.

Destiny of Mining Investment.

The recent past experience of the mining industry has introduced into financial and other circles a subject of discussion of great interest to mining investors and speculators—indeed, to all who are connected with this great industry either closely or remotely. It is whether mining investment will gradually decline until it reaches, in a few years, the vanishing point, or whether, on the other hand, it will more and more attract the capitalist class, to the detriment of other phases of industry. Now, this is seemingly a difficult question to answer, but it would not be audacious to predict, with some feelings of assurance, the future course of public investment. The probabilities are highly promising that the mining industry will increase in favor as the years roll on, as new gold fields are opened up, and as scientific methods are modified and improved upon. But we must always expect to see ebbs and flows. The stream of investment will never flow uninterruptedly and in increasing volume.

But, in forecasting the future, a most important and vital circumstance must be taken into full consideration. The many evils from which the industry suffered in the past have been greatly diminished, and will become fewer as the years advance. Consequently dangers will be lessened, and investment will not be so risky an enterprise as of old. It is safe to say, therefore, if the public will fully grasp this fact, that, far from allowing their favors to be diverted elsewhere, their affection for the industry will become stronger, and thus mining, instead of declining, will become more and more the favorite medium of investment. Science is advancing. That is the great hopeful, assuring fact. Where in the past profitable working was impossible, with improved machinery and more economical methods of treatment mining can now be carried on with success. Then new gold fields are coming forward destined to surpass in richness and reliability anything that has yet been heard of. The failures and disasters which accompanied the introduction of some of the great gold fields in the past are not likely to be repeated in the careers of these newcomers, for not only are the indications of permanence most convincing, but the facilities for economical working are exceptional, whilst profits will be earned from the treatment of tailings which in old times were discarded as valueless. This is another powerful reason against the decline of mining investment, and one which should foreshadow greater activity than has ever yet been displayed. The great evil, of course, is gigantic, and the less remediable of all. It is the unscrupulous company promoter, whose insidious tactics it is almost impossible successfully to combat. Enormous capitalization is insignificant in comparison with his success in foisting worthless properties upon the unwary investor. Though he is believed by many to be less successful than of old, owing to the exercise of greater caution and judgment on the part of the public, this is very doubtful. —London Mining Journal.

Side Lines Adjoining Agricultural Patents.

A correspondent asks what action has been taken regarding the Sawyer decision which forbids the following of veins or lodes past side lines of a mining claim into land under an agricultural patent of date prior to the location of the mine. Unless legislation is had in the matter there is no likelihood of any change. In the case of Amador Medeau Gold Mining Company vs. South Spring Hill Gold Mining Company et al., as reported in Vol. 36, Federal Reporter, page 668, Judge Sawyer stated in his decision, "The only question is whether, under the Revised Statutes, a party discovering and acquiring title by patent from the United States to a mineral gold-bearing vein or lode having its apex within the land purchased, is entitled to follow the vein or lode down on its dip, across the boundaries of his own land into the agricultural lands of an adjoining proprietor who has the older title? In my judgment he clearly has not. The equitable title to the agricultural lands, held by plaintiff, fully rested on the entry and payment by Hammack on June 15, 1874. After that the United States merely held the dry legal title in trust for the purchaser without any pecuniary or beneficial interest in it. From the moment of the entry, payment, and issue of the certificate of purchase, these lands cease to be public, and become private property. Milling Company vs. Spargo and Same vs. Fick, 8 Savoy, 647, 16 Fed. Rep., 348, and cases cited. Also, Wirth vs. Branson, 98 U. S., 118; Deffeback vs. Hawke, 115 U. S., 405, 6 Sup. Ct. Rep., 95. By the entry and payment by Hammack, there being no known mine on the land, the entire interest to the center of the earth rested in him, and there was nothing left in the United States for a subsequent grant to other parties to operate upon. The only exceptions in the patent relate to easements and other prior rights already vested in other parties, before the date of the entry, as was held in case of Milling Co. vs. Spargo, cited. No other exceptions are authorized by the statute to be inserted, and exceptions not so authorized, if inserted, would be void. Cowell vs. Lammers, 10 Savoy, 254, 21 Feb. Rep., 200; Deffeback vs. Hawke, 115 U. S., 402, 406, 6 Sup. Ct. Rep., 95. Section 2322, Rev. St., relied on by defendant, does not authorize any such exception, and it only applies, at most, to public lands, and to rights acquired by such lands before other parties acquire interests therein. It certainly does not apply to agricultural lands disposed of years—perhaps half a century—before by the Government and before any easement, or other right, has become vested in other parties. The United States can undoubtedly grant easements, and other limited rights, in any portion of the public lands, and subsequent purchasers must take them burdened with such easements or other rights, but when it has once disposed of its entire estate in the lands to one party, it can, afterward, no more burden it with other rights than any other proprietor of lands. *Mining Debris case,* 9 Savoy, 493, 18 Fed. Rep., 753. The defendant acquired no rights in the premises in question under the section cited, or any other statute of the United States, brought to the notice of the court, as against the prior grant plaintiff holds. The result is that there must be a judgment for plaintiff, and it is so ordered."

German Deep Mining.

The Journal of the Society of German Engineers contains a memoir on mining in the Upper Harz, by Mr. von Groddeck. The veins, which have been worked since the earliest times, yield argentiferous galena, zinc-blende, and copper pyrites. Ample water power for working the mines is available, for art has come to the aid of Nature by hydraulic undertakings of great magnitude. Conduits, aggregating 75 miles in length, convey the water into 70 reservoirs with a capacity of 13,000,000 cubic yards. Secondary conduits of 50 miles in length convey the water to motors aggregating 3500-horse power, the supply being sufficient to last for fourteen weeks of uninterrupted want of rain. The water is economized in such a way that it is led from the higher motors to lower ones, and finally to others deep down in the shafts. The various mechanical appliances used in the mines are passed in review by the author, special reference being made to the man engines and the hydraulic engines. The new Kaiser Wilhelm shaft has been sunk vertically to a depth of 2840 feet. It has an internal diameter of 16 feet, and is the first and so far the only winding shaft in the Harz, with a circular section and with iron tubbing. The sinking was begun in 1880 and finished in 1892, the cost being £90,000. The remarkable feature of the shaft is the absence of machinery from the surface, all the motors being hydraulic engines placed at a depth of 1180 feet in the shaft at the level of the great Ernst-August adit. The water required is brought down in pipes from the surface and escapes through the adit.

Mining Summary.

CALIFORNIA.

Amador.

Republican: At the Kennedy rock from this mine at the 2150 level averages $15 per ton. The new hoist for the north shaft will have greater power than any ever used at the Kennedy mine. The company has lately bought thirty acres east of its location on which a perpendicular shaft will be sunk to a depth of 2500 feet. Sixty additional stamps will then be put in.

The Anita mine has reached a depth of 500 feet, and last week a very heavy flow of water interfered with work. The pay chute is 114 feet in length.

At the Zeila the retimbering of the shaft has caused several months' delay, but the work is now nearing completion. A station has been cut at the 1180 level which is to be opened up. The mine will probably be in full operation some time in July.

Ore from the Argonaut mine amounting to 500 tons was handled at the Zeila mill recently and yielded an average of $11 per ton free gold.

D. Dutmann has purchased the Muldoon mine and will begin operations within a short time. At present work preparatory to the location of the shaft and hoisting works is going forward.

On the South Eureka, at a depth of 1200 feet, good rock has been taken out. A second shaft is now being sunk 900 feet south from the present workings. A drift 485 feet north and 380 feet south was made in this mine before encountering any pay chute.

In the Union Consolidated a station at the 500-foot level was cut some time ago and the ledge encountered 22 feet from the shaft. The improvement of the rock is apparent, and no doubt the 30-stamp mill will be kept going in the near future.

Ledger: At Volcano in the Marklee mine, which has remained idle for many years, recently G. P. Rixford of San Francisco acquired some of the interests of Marshall and Hall and he now proposes to reopen the property.

The Iron Mass has the new hoist in operation and has taken out the water. The management of the Iron Mass is in charge of A. B. McLaughlin and he proposes to sink to a new level and take out and crush ore.

At the Monte Cristo recent developments in the ore body show improvement in the amount of gold carried.

Record: At the Potazuba mine the shaft is down 360 feet and sinking is progressing at the rate of 2 feet per day. It is the intention to run drifts north and south at a depth of 500 feet; and if the lode is found to be as good as that encountered on the 100 and 200 foot levels a mill will be erected.

At the American mine sinking is progressing, and in the bottom of the shaft a 10-foot vein of ore is exposed. The mill has been started up again. Sixteen men are on the payroll at present.

Liens and attachments aggregating $10,000 have been filed against the Bay State mine at Plymouth.

The Baliol mill is running steadily on the adjacent property.

The Argonaut 40-stamp mill will be completed in about three months.

Butte.

The manager of the Consolidated Gold Mines of California reports to London as follows: 800-foot level—South drift has been extended a further distance of 21 feet; 1000-foot level—Twenty-five feet north have been crosscut from the east crosscut to make preparations for sinking proposed winze on the quartzite; 300-foot level—The bulkhead from the east crosscut has been removed to the west side, and we have commenced to clean out the 760 feet of tunnel between the shaft and Amosky vein. Clark and Coffee—In this mine we have commenced to raise on the vein, which looks very promising, and for the week just ended thirty-eight tons of ore from the raise have been removed to ore bin ready for milling. The 10-stamp mill is now running full time, and next month will work a fortnight on Clark and Coffee and a fortnight on Banner ore.

Calaveras.

Prospect: One of the properties owned by the Murray Creek Mining Company, has been bonded to J. B. Rodgers, and work will commence on the mine next week and the mill will soon be started up. Two tunnels have been run, one crosscutting the ledge at a depth of 125 feet and the other at a depth of 200 feet.

Chronicle: At the Paragon mine work is progressing well in three tunnels. Tunnel No. 1 is now in 127 feet and has cut the Paragon ledge. It is full 7 feet wide, lies in smooth slate walls, well defined, the quartz prospects well in free gold and also carries a large percentage of sulphurets. At tunnel No. 2, on the Tip Top ground before reaching the Bullion lode a well defined 4-foot vein was encountered, with yet no foot wall reached. Four feet of quartz shows that it will mill well in free gold. Tunnel No. 3 is being driven on a small vein in the Tip Top ground, which vein averages 12 inches wide and is high grade. They have constructed a 5-stamp mill with timbers and shafting for ten stamps.

The Malones mine at Robinson's Ferry on the Calaveras side of the river closed down last week, an order to that effect having been received from the directorate in San Francisco. About twenty men were thrown out of employment A deposit of rich telluride ore was found in this mine about a year ago.

At the Quartz Glen mine near Rich Gulch the working tunnel has been driven in over 1000 feet on a fissure vein, with granite walls, the ledge averaging 6 feet and carrying a large percentage of good sulphurets. The mill has five concentrators. A. U. Marsh is superintendent and twenty-five men are employed.

Col. W. T. Robinson has bonded the Wesson quartz mine. Active work is now being prosecuted on the lead. A 10-stamp mill will be put upon the property.

At the South Paloma (extension of the Gwin) a 35 H. P. hoist has been put in to sink to 1000 feet out and drift the ore body. The shaft is now down 675 feet. The large hanging wall vein has pitched towards the foot wall and the two are expected to contact at 700 feet.

El Dorado.

Nugget: At the Pine Hill mine fourteen men are employed. They are down 340 feet, and have about 1100 feet in drifts and prospects.

At the Griffith Consolidated they are down 270 feet. They are sinking for the 300-foot level. At that time they will commence drifting.

The Atlantic mine, near town, has been bonded, and the present controllers are repairing the old shaft with the intention of sinking deeper.

Kern.

Randsburg *Miner*: In the Val Verde No. 2 last week a new 3 foot vein was uncovered. Since then the vein has been perceptibly widening and the ore has increased in richness.

On the Alameda ore is being sacked for shipment. Ore in the various workings continues to grow better as depth is gained.

Kinyon & Sons have just received $3,346.40 from the mint, the result of a cleanup on forty tons of ore recently milled at Garlock.

W. B. McConnell, F. A. Pratt, H. F. Parker, J. A. Haralson and H. C. Flanagan have just taken a bond on a group of four claims near the Petaluma in the sum of $22,500, and will in a few days put men to work developing the property. The claims are the Skookum, Yorkshire Lass, Spokane and Superior.

Nevada.

(Special Correspondence.) — California is recognized the world over as a great gold-producing country. To-day, with the fabulous amount of gold taken from her hills and valleys, the State is still in the infancy of systematic mining, and none the less so in the production of precious metals.

Nevada ranks at present as the banner county of the State in the mining field, and yet it is safe to say that she is only in her babyhood. Present development and present indications point to the assurance that in the territory of this section awaiting the prospector's pick and the capitalist's aid to labor, prudent investment cannot make any error of judgment by coming into this county.

Whilst much is said of the "Great Mother Lode" in the lower tier of mining counties, the question is rightfully asked, "What about the Great Father Lode running through Nevada county?" In reply to this, one need but refer to the Nevada City and Grass Valley folio of the United States geological survey for authority as to the rich and extensive formations permeating the county. Aside from this, the properties at present in active operation are a most convincing argument of the productiveness and stability of the county.

The question of deep mining, as is well known, is no longer an experiment in this section. It is none the less true that properties which were abandoned at water level, or such as failed some years ago for want of high explosives, are again receiving attention, and some of them are already proving themselves a veritable storehouse of wealth. Some of these shall receive special notice later on in verification of the statement made in the preceding sentence.

New developments are gradually coming to light, and these, too, will be referred to specifically, to show the true state of facts in the advancement of mining in this county.

With its past history, its present record, and its new discoveries of paying ore bodies, Nevada county is certain to attract the attention of capital seeking opportunities for careful and safe investments. Like in many other localities, much of future success must depend in a measure on assistance from outside the county, though perhaps few localities show such a precedent for investment of home capital as do Nevada City and Grass Valley. The field of operations is widening and is consequently not confined to one or two particular districts.

It is probably well to state for the information of many Eastern readers of the MINING AND SCIENTIFIC PRESS that Grass Valley and Nevada City are both on the railway, and but a short distance of connection at Colfax with the overland trains from the East.

In addition to the mining resources and railway facilities, the other important factors of wool and water abound in plenty and convenience. Electric power is no less a representative feature in active operation. With the above facts, though briefly outlined, a fair knowledge and a safe estimate can be gained of the present important position, and the promising future, of Nevada county in the mining world. J. F. L.

Nevada City, June 28, '97.

Transcript: Letson Balliet is looking after the affairs of the Des Moines company that is working a mining claim on Alder creek west of Truckee. A double compartment shaft is being sunk on the ledge and is down about 40 feet. Preparations are under way for erecting a hoisting and pumping plant, to be run by water power.

A. L. Bigbie, who will direct mining operations for the Electric Power Company in the Yuba river channel during the summer, has left for the scene of his work. He will make Purdon's crossing his base of operations. The water of the Yuba will be turned into the Power Company's flume and the gravel in the river bed will be prospected to see if it will be profitable to work the long stretch of channel that can be drained. Within a few weeks forty to fifty men will be at work under Mr. Bigbie.

Placer.

Sentinel: The Jubilee quartz mine near Auburn is being developed. The ledge is from 2 to 2½ feet in width and shows free gold in many places. It is owned by Paul, Kirby, Morgan & Bourne.

Herald: At the Gold Blossom mine a hoist is being erected to be operated by steam and the drills run by compressed air. The machinery that is being put in is sufficient to enable them to sink to the depth 1500 feet. It is the first mine in this vicinity that has done away with the bucket and adopted the cage as a means of hoisting.

Plumas.

Independent: At the Plumas Imperial mine, owned by C. D. Hazard, piping has been brought to a close for the present season, and the work of cleaning bedrock, bedrock cuts and gold flumes is being vigorously prosecuted.

National Bulletin: At Taylorville men are being put to work on the Lucky S. mine. This property was purchased by Mrs. Weggener last year, but little work has been done since.

The mill at the Robinson mine was started about a week ago and the yield of gold thus far has been much better than was expected. New hoisting works will be erected and power drills put into the mine. About thirty men are now in the employ of the company.

San Diego.

Union: The placer claim of 120 acres twenty-five miles beyond Foster station, on the Cuyamaca railroad, owned by Pierce, Benton, Morse, Burk and Schafer, all of San Diego, has been sold to Colorado mining men, who will develop the property. The price paid was $30,000. It is expected that work will begin in about a month.

Shasta.

Free Press: A ledge of gold quartz ore has been struck in the Salee & McDonnell mine, at Bully Hill. They began work over a year ago upon a long tunnel with which they expected to cross cut a ledge of free gold ore. They ran through several small veins and finally, after running 1000 feet, tapped the ledge at a depth of 500 feet.

Chapman & Voluntine, owners of a hydraulic mine on Clear creek, have closed down after a very successful season's run.

Fitzhugh, McCutchen and Henshaw agree to deliver to the Mountain Copper Company each week for six months, from June 3d, thirty-five tons of quartz ore from the Evening Star mine, in Old Diggings mining district.

The National Consolidated Mining Company, at Old Diggings, has twenty-eight men in the mine, and the mill is crushing quartz with good results.

Searchlight: At the Niagara little is being done pending the reorganization of the company, which will be effected by July 1st.

D. B. Hunt, representing Senator Jones & Company of Nevada, is placing two large 2-stamp batteries on the Milkmaid mine at French Gulch, which, owing to their large possible discharge, are regarded as equal to an ordinary 10-stamp mill. Twenty men are at work, and more men will be employed July 1st. About 600 tons of ore are on the dump from development work.

Hall & Carpenter, who have opened up a property at Hall City, are now crushing ore from their mines.

The Gladstone, owned by the Euclid Mining Company of Ohio, superintended by F. E. Brighton, is reported to have made a new rich strike. Upon being exposed the vein proved to be 5 feet in width.

The Portuguese Flat property near Delta has been purchased by W. R. Conant, who is now sole owner of the whole property, comprising nineteen claims. It is a combined quartz and gravel proposition, and, so far as has been worked, has given good returns. Mr. Conant proposes to begin a thorough development.

At Harrison gulch Capt. Roberts is putting in his new process, and is resuming work. Twenty-five men are in the mine and seven are at the mill. Only five stamps of the mill are running, owing to insufficient capacity to treat the product of the complete mill. The settling tanks, barrel amalgamators, etc., of the new process are now in use, but the cyanide tank is not yet completed.

Sierra.

(Special Correspondence). — Development work in and about Forest is showing considerable activity. The Bald Mountain Consolidated Company is at work at the edge of the village. Their tunnel is 2700 feet long, tapping the channel at 2400 feet. They are crossing the channel, and at 400 feet have not yet reached the west rim. There are eight men employed in the development work. An 8 ton locomotive is on the ground and will soon be put in use for hauling the cars. There is a water right and tailing claim attached to the grounds, which comprise 800 acres. F. W. Page is manager, and J. O. Jones is the superintendent.

The Kate Hardy on Oregon creek, a quartz property, has two tunnels 60 and 300 feet. The ledge will average 4 feet of pay ore. The formation is slate hanging and porphyry footwall. The property is idle at present for want of means to prosecute the work. Hooper & Dudley of Forest are the owners.

Benson & Meehan, nine miles east on American Hill, have tapped an ancient channel by an 800-foot tunnel. Gold is found in soft bedrock in coarse pieces. They have 200 acres of ground.

The Dreadnaught quartz mine, three miles from town, has two tunnels on the ledge, which averages 16 inches, running from 3 inches to 4 feet, the ore averaging $5 per ton. The formation is serpentine and slate. The lower tunnel is 600 feet long and has 200-foot backs. The property is idle for want of capital. E. L. Craft is the present owner.

The Bald Mountain Extension (gravel) is running a tunnel for the channel, which at present is 845 feet long. The gravel yields a good "prospect." This is the old Bald Mountain lead which paid handsome dividends for thirteen years. The company (incorporated) expects to reach the channel within a short distance.

Forest, Cal., June 26, '97.

Enterprise: The hydraulic mines at Craycroft have closed down for the season. The clean-up for the year exceeds expectation.

Siskiyou.

News: The McKinley mine, near Oro Fino and owned by Raymond, Tuttle & Coburn, is being developed by tunneling and a large body of ore has been opened up.

A rich chimney of ore has been struck in the old Steele ledge of Quartz valley, now the property of Morrison & Coburn. This mine is showing up well under late developments, aside from the recent important find.

There is some talk of fitting up the old Steamboat mine near Fort Jones for operations.

Considerable prospecting has recently been done near Honolulu with good success. Several promising claims have been located.

A new 10-foot vein of porphyry is being developed by Freshour & Jackson. The dyke is located on the summit of the mountain between Lumgray and Empire creeks, at an elevation of about 1000 feet above the Klamath. It is supposed to be an extension of the 50-foot dyke on Empire owned by Mr. Freshour, which will mill about $3 50 in gold. There are thousands of tons of ore in sight in the upper dyke, which has a tunnel in 80 feet.

Journal: At the Commodore mine on Barkhouse creek some good work is being accomplished. This mine is at the head of Barkhouse creek. The double arrastra reduces five tons of ore every twenty-four hours.

Bailey & Carrick of the Katie May mine on Greenhorn have not been taking out any ore from their mine lately, but are soon to run a tunnel.

The Scheld brothers are taking out some good ore at their mine on Long gulch, near Yreka, which they crush in an arrastra at the mine.

Reporter: At Sawyer's Bar a number of prospectors are at work in the different gulches in this vicinity.

One by one the hydraulic mines are closing down on account of the scarcity of water. All the miners seem to be satisfied with the season's run, although it was exceptionally short.

Mauche and partners are digging a ditch on their claim that will give them about 4000 more inches of water.

The Jumbo mine will open shortly.

Trinity.

Searchlight: Chambers & Harrison at Hall City have a lease and bond on the Green property, comprising the Yellow Stone, White Rock, Sabbath and Quartzite claims. About fifty tons of ore are on the dump. They also have a bond from Hall & Landis on the Isabel and Evaleen claims, and are now putting in a 5-stamp mill, which will be running next month.

Journal: On East Fork the Thanksgiving mine is being operated with good results.

At the North Star mine ten stamps are kept dropping on good ore. Mr. Mayberry, the superintendent, has recently fitted up the mine well and has it on a paying basis.

Reed, Given, Simpson and Zuella have recently discovered a 3-foot body of ore.

At the Lone Jack mine under the superintendency of Grant Day, the mill is kept running steadily on good ore.

At the Independence mine, owned by Hippler, Carr and Brown, work is steadily progressing toward the main chute of ore.

Tuolumne.

Democratic Banner: The Green mine, between Confidence and Sugar Pine, is being pumped out preparatory to development.

Superintendent Richard Chute, at the Rappahannock, is drifting on the fissure vein from the 600-foot level.

At the Arbona a tunnel 190 feet has been driven and drifting is being done north and south. The vein is from 4 to 12 feet and carries free gold and sulphurets. There is upon the dump 500 tons of ore ready for the mill, which will be in operation by the 15th of July.

At the Marietta, under the superintendency of W. G. Long, the shaft is down 400 feet. At the 150-foot level drifting is being done that will tap the Gagnere. The vein is from 4 to 8 feet wide. Mr. Long commenced operations on the Patterson, below Tuttletown, this week.

N. J. Coleman has a shaft 145 feet in the Anchor and will sink it 300 feet, at which point he expects to cut into the vein.

G. Ogden, at the Providence, has a 6-foot ledge in the bottom of the winze, which gives a good mill test both in free gold and sulphurets. Mining expert Newhouse, of San Francisco, has examined it for San Francisco parties.

Union Democrat: At the Rawhide the main shaft is nearing the 1200-foot mark, and a new station and level will be run when that depth is attained. Work still continues on the north drift of the 800, while the big body of ore in the slopes between the 1000 and 800 levels is fine as ever. The vein holds a regular width of about 35 feet.

At the Lady Washington the mill is about completed, and will soon be crushing ore from the mine.

At the Providence preparations are being made for putting in a hoisting plant. Work on an upraise from bottom of shaft is being

prosecuted. When this is completed sinking will be continued for 300 feet.

At the Grizzly a hoist is in course of construction, while sinking on the vein still goes on. A large flume is being built to convey water from the river to the property.

Eight men are drifting and cross-cutting on the Consuella.

Mother Lode: At the Golden Rule a cross-cut is being run for the east vein on the 300 level.

At the Trio the new three compartment shaft is down 45 feet. Two ten-hour shifts with four men each are employed in sinking. A rich body of ore has been found in the west cross-cut on the 200 level in No. 1 shaft.

Yuba.

Nevada *Transcript*. At Smartsville the Allender Yuba River Mining Company is beginning preparations for mining the river bed with renewed energy. It is expected that everything will be in running order by the middle of next month.

Interest in the quartz mines is still in the ascendant. Considerable work has and is now being done on what is known as the Nugget Ledge, on Sand Hill.

NEVADA.

Silver State: J. A. Blossom has shipped from Winnemucca fifteen tons of high-grade ore from his Kennedy mine to a smelter in Utah.

Tuscarora *Times-Review*: The ledge in the Dexter was encountered in the new shaft, as was predicted by Supt. J. F. Parsons. At present they have not reached the footwall, and its full extent is yet a matter of conjecture. It is the intention of the company to carry the shaft on down. Both the foot and hanging walls run high in gold and are milling ore.

Sluicing has begun on the placers of the White Rock Mining Co.

Mason and Fleishman have made a new strike on their copper property on Lone mountain.

Pioche *Record*: The De Lamar Company increased its working force. More men are employed than at any time in the past. The work of reopening the caved ground of last month is being pushed. Prospecting work has been resumed. The mills at the De Lamar Works are operated principally at night. It is comparatively easy to crush the 300 tons of ore needed per day in this time.

On the Oro mine, adjoining the Magnolia, the owners report at the bottom of the shaft 4 feet of ore that assays well in silver, besides a good showing in gold.

The work at the Magnolia has opened up what appears to be a new ore body. It lies to the south of the old chute, though close against it and very near the middle of the claim. An extensive broken up country, largely porphyry, is found, from which some fairly good ore is mined. The main tunnel has been pushed ahead and another ore chute encountered to the north.

White Pine *News*: At Cherry creek, in the Grey Eagle shaft, men are to prepare for sinking, and at the Star shaft sinking is being pushed as rapidly as possible.

The North Mountain Co. at Egan canyon are putting their machinery in position, and very shortly the mill will be running.

A new strike was made in the Ontario mine, Robinson district, last week. The ledge is about 3 feet wide and the ore goes about 55 per cent lead and carries a good percentage of gold and silver. This is one of the oldest locations in the camp, having been worked for lead and silver many years ago. At that time, however, the value of the gold found in the ore was comparatively small, and formed no part of its shipping value.

Yerrington *Rustler*: Fish brothers are drifting on the Argona. Forty-two men are now on the payroll of the Boston Nevada Company. The shaft at the Pratt mine is down 90 feet and four men are taking out good ore from a 2½-foot ledge. The owners of the Irma Faye mine are now down 45 feet and the ore is getting richer. A 20-inch vein of excellent quality is reported from the Lottie. The shaft has been sunk 34 feet and the ledge is strong. Four men are at work on the Strosnider mine, sinking and stoping in good ore. As soon as the 125-foot level is reached crosscutting will commence. The Pioneer mill at Pine Grove, which has laid idle for many years, started ten stamps on low-grade ore last week in order to test the machinery.

ARIZONA.

Journal-Miner: R. M. Dougherty has sold his Charleston mining claim in the Bradshaw mountains to the Gladiator Mining Company. The claim is an extension of the Crowned King and shows up well in ore.

The price at which the Standard group of claims on the Santa Maria were sold was $75,000, instead of $50,000, as previously reported.

Another body of free milling gold ore has been encountered in the Little Jessie mine at a depth of 190 feet.

The Crown Point group of gold claims, situated near Walnut Grove, under Superintendent Brodie, is showing up finely. As depth is reached, the lead not only is widening, but the grade of ore encountered is richer and gives indication of permanency.

Mojave *Miner*: In sinking the main shaft of the Eureka mine at Cerbat a 5-foot body of six-ounce gold ore has been encountered. The shaft on the Eureka has been sunk between the ore chutes, and the opening of the new ore body was a surprise to the owners.

At Painted Canyon a trial run has been made with the Smith stamp mill. The teams hauling from the mine are unable to supply the mill with sufficient ore, but more will be put on this week.

Kay & Vandercook have gone to El Dorado canyon to again start up work on the mines at Kay camp.

Many prospectors are going into the country south of Kingman in search of gold. There are many small ledges showing on the surface within four miles of town.

At the Connor mine J. Barry is making extensive improvements at his mill, and will soon be able to increase the output.

W. Burkhart is taking rich ore from a lease on the Retort mine, Mineral Park.

I. C. Conkey has put men to work on the Lady Bug mine, at Mineral Park.

OREGON.

Baker City *Retrocl. Democrat*: In the Cliff mine, north of the Flagstaff, a recent discovery made by the Bradbury Bros., the ledge in the drift from the bottom of an 80-foot shaft shows a width of 5 feet.

Montana people have made an examination of the Balsley-Elkhorn mine, with a view to a purchase of the property. The mine and mill are running with satisfactory results.

The placer mining season will soon close, on account of a scarcity of water. The season has not been as long as was anticipated. The output of gold thus far has been large, and the final clean-ups will swell the total.

P. Berthon, manager of the Flick Bar Mining Company, operating near the mouth of Powder river, has built a ditch eight miles in length and a reservoir this spring, and the claims are now in operation.

Monitor-Miner: The Brass Nail, a placer mine in the Jump-off-Joe district, owned by J. W. Robinson, has been developed for three years. Owing to scarcity of water it can only be worked from three to six months in the year, but up to date it has produced about $6000.

The Oregon Bonanza Company is operating night and day at the Anderson mill on Eclipse ore. This ledge shows two feet of solid quartz, all high grade.

BRITISH COLUMBIA.

(Special Correspondence.) — The mining world is distressingly flat just now and the cause of the depression cannot be accurately stated. A combination of unforeseen circumstances is responsible, but none of the mining men appear to be able to give an intelligent reason, but all are confident that the depression is only temporary. Rossland papers say that owing to British Columbia mines Canada is about to experience a period of prosperity. No doubt in time Canada will be greatly benefited by development of British Columbia mines, but for want of capital the mines are being developed very slowly.

There are many good prospects along the seaboard being taken up largely by Americans The numerous islands in the Gulf of Georgia are alive with prospectors and claims are being staked every day. Many of them are being purchased by Americans, but after the report of the sale nothing more is heard of them. The time will come when there will be a great deal of business done in the way of shipping ore and legitimately developing the mines in British Columbia territory, but perhaps owing to the unsettled state of the English money market and the fact that Americans are turning their attention entirely to the Kootenays, the seaboard propositions, though the most rosy reports of their merit are being given, seem to be between the prospecting and developing stage. There are, however, three or four free milling propositions which will be crushing in sixty days, the Golden Cache in Lillooet and the Tinhorn in Okanogan district being the principal ones. If these mines make a good showing they will do much to restore waning confidence.

The Providence mine in Harrison Lake district is now shipping in small quantities to the smelter, as is the Athabasca of Nelson district. The latter is a free milling proposition. GOODMAN.

UTAH.

The Chicago Pumice Company is making arrangements to develop extensive pumice stone beds in Miller county, Utah, where the company owns 120 acres of land said to possess an abundance of the product. James Quigley is president of the company.

Tintic *Miner*: Shipments from the district for the week are as follows: From the Bullion-Beck, 20 carloads ore; Centennial-Eureka, 3 carloads; Gemini, 10; Uncle Sam, 6; Ajax, 5; Carisa, 1; Sioux mill, 1; Swansea, 3; South Swansea, 6; North Star, 5; Governor, 1.

From the Gemini five carloads were sent out Monday and five Wednesday. For a time at least the shipments will probably amount to five carloads every other day.

At the Beck the force has been slightly increased during the past week, and the ore being sent out is reported to be some of the highest grade ever found in that great mine.

MONTANA.

Basin *Progress*: J. Berkin of Boulder has leased and bonded the Legal Tender group on Cataract creek for three years at $12,000 A shaft is down 50 feet on the lead, and Mr. Berkin will continue this down to the 100-foot level, at which point they will drift on the lead.

The Boulder mill has been started up. This mill and mine have been leased for three years to O'Neill and Largent by the Boulder Gold and Silver Mining Company. At present five stamps will run. Soon a set of jigs will be put in and two vanners added.

COLORADO.

(Special Correspondence.)—The new chlorination works, of fifty tons daily capacity, has been treating telluride and sulphide ores for the past fortnight, and two gold bricks have been produced that were valued at about $6,000. The management of the Delano Mining and Milling Company has built this chlorination mill at a cost of about $50,000, for the purpose of treating the enormous quantities of low grade mineral produced in Boulder county, yet is exceedingly doubtful if the object be attained. The price for treating ore has been fixed at $10 per ton, which is $3 above the charges at the smelter for raw ores, and $6 higher for treating concentrates. It is stated that the actual cost of treating ore by chlorination will not exceed $3 per ton, which would give a net profit of $7 per ton or $350 per day.

Arthur G. Gorham, president and manager of the Marshall coal mines, returned from New York City last week, where he has been in consultation with the directors of the company. Extensive arrangements were consummated for opening the recently discovered Gorham coal vein, which is 10½ feet thick, of elegant coal for domestic purposes. Superb machinery has been ordered for the mine, which is situated one-half mile southeast of Marshall camp, and near the Gulf railroad track. While the new slope is being made to the coal, and machinery erected, the several mines owned by this company will be run to their fullest capacity in order to supply the demand for this particular coal. Marshall is the oldest coal camp in Boulder county, and will, during the winter, be an exceedingly lively town. Other mining matters, involving an outlay of $250,000, were discussed by President Gorham before the board of directors, and within the next sixty days a company will be organized for the purpose of consummating the scheme.

The new Inter-Mountain Railway has received wonderful impetus during the past three weeks, by visits to this city of important railroad men from the East. J. T. Blair, of Greenville, Pennsylvania, has made a careful examination of the surveyed route from Boulder City to the mining camp of Ward, with a view of the success of such an enterprise. The road will be a 30-inch gauge; will be thoroughly equipped with the most modern and powerful locomotives for the mountain work. The object is to haul ore, passengers and freight at much reduced rates.

The company also proposes to build in the near future a mill—chlorination, cyanide or some cheap process for treating low grade ore. The capacity will be from 300 to 500 tons daily, and the supply of mineralized matter will be purchased at the mines of the numerous camps.

The Kilton Company treats about eight tons of mineral daily by chlorination, while there are other chemical processes in operation in Boulder City treating the tellurides more or less successfully.

The bromine process has proven a failure so far as treating the tellurides of Boulder county mines. Over $125,000 have been spent in the Keystone-Mountain Lion mines, and building the large mill, which the owners said would save 95 per cent of the precious metal contained in the ore, at a cost of not over $2 per ton. The ore carried no gold and silver, or the process failed to save these metals.

The miners and merchants have put a lien on the property and the court has appointed a receiver. WM. M. RULE.

Boulder, Colo., June 23, '97.

Republican: Assayer W. J. Plunkett of the United States branch mint gives the following statement of the gold bullion received at the mint for the fiscal year ending June 30:

	1896.	*1897.*
First quarter	$1,186,161.12	$1,224,091.54
Second quarter	1,108,415.68	1,117,709.02
Third quarter	834,007.86	1,556,294 59
Fourth quarter	1,069,436 76	3,045,819.06
Totals	$4,198,021.42	$6,944,904.19
		Gain in 1897.
First quarter		$ 38,330.42
Second quarter		9,383 34
Third quarter		722,286.71
Fourth quarter		1,976,382.30
Total		$2,746,882.77

If the figures given by the director of the mint and by the Wells-Fargo Express Company, both of which give Colorado approximately $15,000,000, are accepted, there is good reason to anticipate a production in this State during 1897 of not less than $25,000,000. For the last two quarters of the fiscal year ending June 30, 1896, and the first two quarters of the present fiscal year the receipts of the local mint were $4,246,235.18, a little less than one-third the total production of 1896, according to the authorities named. Assuming that the last half of the present year will be equal to the half just closed, Colorado will have in mint receipts for 1897 over $9,000,000, and with all due allowance for unforeseen accidents, if the ratio between mint receipts and total production in 1896 holds good during 1897, the estimate of $25,000,000 is within the bounds of reason. It is well known to all mining men that the output for this year will be a very heavy increase over that of last, and estimates made so far based upon what is known of the present production of leading mines and districts range from $20,000,000 to $25,000,000, with the probabilities strongly in favor of the latter figure.

At Cripple Creek Manager Weston of the Good Will tunnel is devoting all his energy to the development of the veins cut in running the tunnel. It is likely that in a few days the treasury, which now only contains $10,000, will have its fund largely increased, when another contract will be let to drive the tunnel ahead.

Manager McDonald of the Strong mine reports that he is now shipping a little over 2000 tons a month of ore that is worth about $50 a ton, average grade. Drifting is under way from the 500-foot level on a large body of ore. A new 100 H. P. boiler is being placed on the property over the main shaft.

The Anchoria-Leland management has resumed the sinking of the main working shaft, which, when work had ceased about the first of the year, had gained a depth of 740 feet.

The Gladden lease on Lindsay ground on Beacon hill has broken into better ore than ever. Every bit of rock hoisted shows sylvanite.

A new plant of machinery has arrived for the Grant & Kline lease on the Cariolanus on Battle mountain. The property is producing regularly.

The people who are working the Elkhorn have started a new shaft, which is now down 75 feet. Within a day or two they expect to put on machinery. The shaft is continued to 200 feet.

On the Hayden gold placer, a few hundred feet east of the Crescent ground, Reed & Hague are saving ore from a 60-foot shaft.

On the Yankee Girl on Womack hill W. B. Webb has taken a bond and lease and started retimbering the old shaft on the property.

The May Queen on the Lawrence townsite, worked under lease by Carhart & Saunders and others, is showing up well. Returns from several small runs from the 5-foot vein opened up at 65 feet have given satisfactory results.

At La Plata A. Lakes, who is making a geological examination of the new district, gives out the following opinion:

"From a general superficial and preliminary survey of the greater portion of the La Plata region, I am of the opinion that the geological conditions are decidedly favorable to the formation of veins and ore bodies. The grounds for this assertion are, firstly, the numerous eruptions of diorite, a variety of igneous rock which, the world over, is notorious for its gold-bearing tendencies.

"Secondly, the peculiar mode of eruptions of enormous intrusive masses and sheets of this lava, in that mode of eruption known to geologists as laccolitic, has also its favorable points by fissuring the country in an unusually plentiful way by traversing it with eruptive dikes and intrusive sheets, and by powerful metamorphic action on the surrounding strata. All these phenomena are recognized by the students of ore deposits as amongst the most favorable conditions for their formation.

"There is evidence, through these agencies, of the production of an unusual number of veins within a comparatively small area, a few of which have already been discovered and partially developed, but we prophesy that many more will be found by future prospecting. It will be premature to predicate the character of all these veins, but in those so far developed there are certain characteristic family features.

"The veins as a rule are comparatively narrow from wall to wall—that is, the gangue matter—and in this gangue matter the pay streaks are still smaller, but in proportion to their smallness they are generally exceedingly rich, and it may be a surprise to many who have supposed that tellurium ores were confined to Boulder and Cripple Creek to learn that the La Plata area is, so far as we have observed, an essentially telluride camp."

At Yankee, for some time past the Gold Coin Company and an Eastern syndicate have been negotiating for the purchase of the Alice. The Eastern syndicate now have a bond and lease on the entire property for two years, the bond being $250,000—$50,000 being paid down, $100,000 to be paid at the end of the first year, and the balance to be paid at the end of the second year. The big 200-ton concentrator belonging to the property is to be thoroughly repaired and probably enlarged. The property is to be worked by air drills, instead of hand drills, as heretofore. The Alice Company owns 1180 acres of patented ground, consisting largely of placer ground, in which the village of Alice is situated. The Alice mine probably contains one of the largest ore bodies of any mine in the State, as it is known to be 310 feet between walls, everything being low-grade concentrating ore, with streaks of rich smelting ore running through it.

The working force on the Shell Back has been doubled Large shipments of smelting ore are being made to Idaho Springs.

Dr. G. W. Compton intends to start up work on his Kentucky property. A large new shaft is shortly to be erected on the Gilt Edge mine.

Some fine ore is being encountered in the Stormy Petrel mine.

Near Salida, in the Cameron district, three weeks ago, one could count on his fingers the properties that were over 15 feet deep. Now dozens of shafts have been sunk to 50 feet and more, and every day the enthusiasm grows. At the surface the veins are small, but depth increases both bulk and values.

At Idaho Springs a new hoisting plant is to be installed at the Smith & Wiley property and the shaft continued deeper from the lower level, which leaves the shaft at a depth of 400 feet. A nice body of mineral shows in the levels being driven.

The rich gold streak found by Henry Blackwood on the divide between Chicago and Soda creeks is showing even richer than at first reported, and 1 inch of the mineral is alive with free gold. It runs $5 a pound. Of course, the streak is small.

While drifting from the shaft at the fourth level of the Eclipse mine, leasers have struck mineral which has all the indications of coming into an important ore chute.

Ore is coming in at the Champion mine, on Bellview mountain, and from the levels down to the sixth several shipments have gone forward.

The Bellman mine, in Virginia canyon, has started up with work near the surface. The vein is the same as the Crown Point, but water makes in the Bellman shaft so rapidly that sinking was stopped by the former company and the mine has remained idle for some time.

Leasers in the Great Republic have extended the Mattie adit and are now coming into mineral which is thought to be the big ore chute like that heretofore found on the lode.

The new shaft at the Silver Age mine was sunk to a depth of 200 feet and levels commenced at 100 and 200 feet. Both of these have been driven west and are now in good ore.

By working through the Lake tunnel, the Windsor Castle people have opened into a big body of lead ore and are getting out some good shipments.

Electrical Progress.

The Riverside Transmission Plant.

Written for the MINING AND SCIENTIFIC PRESS by W. A. LAYMON.

(See Illustrations, Page 1.)

On December first, '96, there was recently turned over to the city of Riverside, Cal., from the California Electrical Works of San Francisco, an electric transmission and general distributing system for power and lighting. The transmission of electric energy twenty-two miles appropriated the energy of mountain streams and placed within the reach of Riverside residents electric power and light at favorable rates.

The Redlands Company, by contract, delivers to the city of Riverside at the switchboard of the generating station a three-phase alternating electric current of 2500 volts pressure. This current passes through step-up transformers which change the pressure to 11,000 volts, at which the energy is transmitted 22.4 miles over the open country to a sub-station in the City of Riverside. There it is in turn again transformed by step-down transformers to a pressure of 2200 volts. From the step-down transformers it passes to a distributing switchboard, and from the latter continues out over the general city distributing circuits—four in number—of which two are for street arc lighting and two are for incandescent lighting and motor work. On these street circuits reducing transformers are again used, changing the pressure to 30 volts for the street and commercial arc lights and to 100 volts for the incandescent lights and motors. From first to last the three-phase system of distribution has been followed.

The generating dynamos, which at present are two in number, are of 250 kilowatts each, and are of the General Electric 3-phase, 6000-alternation type. As before stated, these dynamos deliver current to the switchboard at 2500 pressure. Since the two machines are not always required there are independent sets of bus-bars, and it is from either of these or both, as the case may be, that the energy for Riverside is taken.

The Riverside equipment accordingly begins with a marble panel on which are mounted three double-throw, single-pole, quick-break switches of the California Electrical Works' design and manufacture, by means of which current is thrown on a special set of three bus-bars feeding the step-up transformers. From these bus-bars the current passes through a panel of specially designed single-pole fuse blocks to the three 100-kilowatt step-up transformers. These blocks are so made that the portion containing the fuse is separable and perfectly insulated, so that were it desirable to do so the fuse could at any time be quickly removed from circuit and as easily reinserted. Furthermore, the blowing of any fuse is devoid of the burning of contacts, and the block is accordingly good for unlimited service.

Coming now to the step-up transformers, there is found probably the most decided innovation of the entire equipment there, three in number, and of a capacity of 100 kilowatts each, built by the Electric Manufacturing Company of St. Louis, under stringent requirements for efficiency. They are a radical departure from conventional practice, each being a series combination of two 1250 to 5500-volt units, encased in cast-iron, oil-filled, water-jacketed boxes. They were designed to afford not only a higher degree of insulation safely, but a more economic use of materials and a higher operating efficiency at all loads than is possible with an air-ventilated transformer. The insulating oil is of the highest quality, as shown by proof tests, to be had in the market and is sent out under guarantee. The iron cases are built up in sections, each lateral member of which is so cased as to give successive small channels confining the water to constant flow up and down as if there were a continuous coil of pipe all around the transformer. The sections are cross connected in such a manner that, all in all, there is not possible any communication of the water and the oil. The water flow is from a gravity head of about 15 feet, and can be regulated at the will of the operator by means of globe valves in the outlet pipe of each transformer. The design is such that no cooling device whatever is required up to one-half or three-fourths load, and not until the apparatus begins to approach the full load does the temperature of the apparatus rise much above that of the atmosphere. Operating under one-third load without cooling device, the maximum temperature attained in a ten-hour run was but 100° Fahrenheit.

Passing from the step-up transformers, the 11,000-volt current goes out through three single-pole quick and long-break switches to the transmission line. These switches are also of special design, manufactured by the California Electrical Works, and are so arranged that the blowing of a protecting fuse automatically opens them. Immediately beyond the switches are the lightning arresters, of the Wurtz pattern.

In the transmission three No. 4 bare copper conductors carry the current. These conductors are mounted on porcelain insulators, these insulators in turn being carried on the iron pins. On the entire transmission line 3300 of these insulators have been used.

The substation is a single-story brick building 36 by 30 feet. The transmission line enters the east side, passing directly to the high-tension switchboard which has single-pole, quick-break switches exactly duplicating those on the high-tension side of the step-up transformers. From this high-voltage marble switchboard, which is about 3 by 4 feet, the 10,000-volt lines pass to three bus-bars to which the step-down transformers are connected.

The step-down transformers are practically identical with the step-up transformers in general mechanical features, being oil-filled and water-jacketed. Their only difference is in the transformation ratio, and the capacity here being but 85 kilowatt units instead of 100 kilowatts as there, and having a reduction ratio of 5.

The step-down transformer secondaries lead direct to the distributing switchboard of the general wiring system of the city.

The marble switchboard, 7 by 12 feet, is designed and made by the California Electrical Works.

The step-down transformer secondaries, on reaching the board, are grouped in three-phase interlinking on the rear projecting studs of fuse blocks at the bottom of the main feeder panel. The current passes upward through these special fuse blocks to quick-break, single-pole switches, thence to the Whitney ammeters above and then down to three main bus-bars extending all the way across the board. Above the ammeters on the panel are three Whitney indicating volt-meters, reading through special resistance boxes direct on the full voltage on each phase of the main feeder circuits. The adjoining panel on the right is for the two three-wire arc lighting circuits. These circuits are fed from an auxiliary set of three bus-bars connected with the main bus-bars through a set of three fuse blocks and three single-pole switches. Between the auxiliary bus-bars and the outgoing branches of the circuits are interposed single switches by means of which the arc load is divided up so that a small portion may be thrown on at one time. On this panel, occupying a position above all the switches, is a single voltmeter so arranged that it can be thrown on any two of the auxiliary bus-bars.

The third panel is for a three-wire incandescent current feeding the western business portion of the city. Here, again, the current for each leg passes from the main bus-bar through special fuse block to a single-pole switch above. Beyond the switch it passes through special pressure regulating transformers to the outgoing line. On this panel there is also a single Whitney voltmeter and a single Whitney ammeter. The former is so arranged, through small throw over switches, that it can be quickly connected to either of the three phases of the outgoing circuit. The latter is so arranged that it may be plugged by means of special flexible leads in parallel with either of the three single-pole switches below, and when so connected the simple opening of the switch in which it throws the current through the instrument. By this process a single ammeter is made to do the indicating, both on this panel and the next, in all branches of the two circuits.

The fourth panel is identical with the third, with the exception that where the ammeter is located on the third there is here placed the ground detector switch. This panel feeds the residence incandescent district, and on this, also, the outgoing line pressure is regulated by means of three Wagner regulating transformers.

The six regulating transformers are designed to control the pressure of the circuits in which they are placed for a variation of 10 per cent above or below the nominal feeder pressure.

For street lighting there are used eighty 2000-candle power helios arc lamps, especially built for this frequency. These lamps are fed from an equal number of 2000 to 30-volt oil-filled transformers.

The incandescent service follows the conventional practice. Where requirements and conditions accommodate themselves, large transformers feed secondary bus-lines, from which grouped customers are supplied.

The system in its entirety has now been in operation a sufficient length of time to demonstrate its success.

The California Electric Works of San Francisco have been represented in the field by A. J. Myers.

The installation as originally contracted for was to have cost $40,978. Additional work will, however, bring this up to about $50,000.

Drilling by Electricity.

The Bryam Oil Company of Indianapolis has completed the first oil well ever drilled by electricity. It is located on a 400-acre lease about four miles west of Indianapolis, within sight of the village of Dundee. After practical tests for a year and a half the company pronounces its power a success. One disadvantage was developed in drilling, and this fault is that the electricity does not raise the tools or the bailer out of the well fast enough. But, altogether, it is said to offer many advantages over steam power. It requires fewer men to operate the wells on the lease, there are no delays from lack of fuel, and, during the cold of last winter, when other oil properties showed a decreased production, that of the Bryam Company was at a higher point than during the summer and fall before.

ACCORDING to the *Journal de Medicine de Bordeaux*, a man placed under arrest for illegal practice of medicine, claiming to be a graduate of an American college, presented a diploma which excited the suspicion of the magistrate. Calling in the services of an expert, the document was submitted to the action of a Crookes tube, and the result showed distinctly the outlines, in the substance of the paper, of a name which had been erased from the surface to make room for that of the man who was convicted upon this evidence.

IN the proceedings of the Chemical Society of London Heycock and Neville describe the study of the sodium-gold alloys with the X rays. Sodium is much more transparent to the rays than gold, and X-ray photographs of thin sections of the alloy show its crystalline structure very clearly. The authors point out that other alloys may be similarly studied, and are at present engaged on those of aluminum. It is possible that by this method our knowledge of alloys may be materially extended.

Scientific Progress.

Liquefying Fluorine Gas.

At a sitting of the Academy of Sciences at Paris lately, M. Moissan communicated the results of his experiments with Prof. Dewar in the liquefaction of fluorine gas. This gas, as is well known, has hitherto resisted all efforts to reduce it to a liquid state. M. Moissan announced in his address that it had now been liquefied by him and Prof. Dewar at about 185° centigrade, below zero. The experiments resulting in liquefaction were conducted in apparatus invented by Prof. Dewar. When a current of fluorine gas is passed into an apparatus maintained in the midst of liquid oxygen in tranquil ebullition at a temperature of minus 180° centigrade, liquefaction does not occur. But as soon as that temperature is diminishing by exhausting the gas above the liquid oxygen, the liquefaction of the fluorine begins, and a clear yellow and extremely mobile liquid is obtained, which resumes the gaseous state as soon as the temperature rises. This liquid has lost the chemical activity characteristic of fluorine in a state of gas. It no longer attacks glass, silicon, sulphur or phosphorus. Fluorine at a very low temperature, however, still attacks carburetted hydrogen, and its affinity for hydrogen seems still to exist. M. Moissan and Prof. Dewar are continuing their investigations, and although solid fluorine has not yet been obtained, M. Moissan is sanguine that this result will also be secured.

An Ergometer.

An instrument in use at Columbia University is a dynamometer made to write on a kymograph. The maximum pressure of the thumb and forefinger or the movement of a single finger could thus be registered, and a series of movements showing fatigue could be recorded. The curves give the actual amount of work done, the height of the curves being proportional to the pressure in kilograms. The instrument was compared with Mosso's egrograph, and curves were shown in which the movements made in lifting a weight and in extending a spring were simultaneously recorded. It was evident that the ergograph curves did not give a correct measure of fatigue, and of course gave no record when the weight was not lifted, whereas the ergometer curves measured more nearly the actual course of fatigue. The instrument is being used in the psychological laboratory of Columbia University, to study fatigue and the effects of sensations and emotions on movements.—Science.

Tin in Canned Goods.

In a graduating thesis at Washington and Lee Universty, J. R. K. Cowan takes up the question of the presence of tin in canned goods, and his results confirm those of previous investigators along this line. He finds tin present in every can examined, including tomatoes, peaches, apricots and sweet potatoes, in quantities of from 60 to 150 miligrams per kilo. Granting that this tin is present in a form which can be acted upon in the human system, and considering the large consumption of canned goods, it seems to follow that tin is less toxic than has been supposed and that it cannot be a cumulative poison. The maximum dose of tin is given as half a grain of chloride, but the amount of tin corresponding to this might often be taken into the system during a single meal. Very few cases of supposed tin poisoning from eating canned goods have been reported, and it is probable there is little danger from this source. In no instance did Mr. Cowan detect the presence of lead.—Science.

AT a late meeting of the Royal Society, London, was exhibited by C. T. Heycock and F. H. Neville a curious alloy of silver and zinc, which would have warmed the hearts of the old-time alchemists. This alloy is of the ordi-

nary color of silver, but when warmed up to 300° C. and then suddenly cooled, it becomes the color of copper. On reheating and cooling slowly, it resumes its original color. The same effect is produced by heating in air, in hydrogen or in a vacuum.

Mechanical Progress.

Weighing Sky Scrapers.

It is necessary for an architect to know the weight of a tall building long before it is put up. The character of his foundation depends upon it. Yet the estimation of this weight is so simple a matter that an under clerk or an apprentice in an architect's office often gets the task of calculating it. His grand total may reach, as in the case of the twenty-one story Surety Building in New York, 50,000 tons, or, in the case of some big bridges like the one at Poughkeepsie, 4000 or 5000 tons. How is it done? In the first place, the weight of every piece of material to become part of the structure is furnished by the manufacture.

Whether it be Z-bar girders or white lead, it is all brought into the total. Even such an insignificant thing as a difference in the quality and kind of paint used may make a ton of difference in the general weight of the structure. Every rivet in the building is accounted for; and if the ends are fused or hammered down on the opposite side of a girder instead of being merely bolted on, the fact must be taken into account. If the roof is covered with tin, the solder which holds the plates together is put down as weighing so much per ingot. In laying the tin plates on the roof the edges of each plate are lapped over the adjoining plates to the extent of a quarter of an inch on all sides. This quarter inch of necessary lap adds a large number of pounds to the general weight of the roof. So the process continues through the whole building. The weight of the clapboards, the plaster, the wall paper, the window glass, the gas or electric fixtures, the cornice ornaments and of the thousand and one materials and appurtenances which go to make up a building are considered and accounted for. In the aggregate, these weights, thousands of tons, constitute merely the dead weights of the building. The live weight, such as the weight of the tenants, the furniture and their other belongings, must be added to the total.

An office building with a capacity of 3000 persons would be about 165 tons lighter at night, when it is deserted, than in the daytime, when it is occupied. In office buildings it is customary to estimate about 100 pounds of live weight to the square foot. The buildings themselves press down upon the earth at the various rates of from four to twelve or fourteen tons to the square foot. The tall St. Paul building is estimated at the last named figure. The Surety building, mentioned above, is estimated to exert a pressure of six tons to the square foot.

Use for Scrap Mica.

C. H. Mitchell, before the Ontario (Canada) Mining Institute, said that by taking the scraps or waste pieces of mica and subdividing them as finely as possible, and then quilting them between galvanized wire netting, that we produce a fireproof mat, flexible and clean, and a non-conductor of heat, that makes a very good covering for boilers, steam pipes, etc. It will be noticed that all these flakes are ribbed or corrugated, the object being to increase the number of dead air spaces in the mat, and also to add to its bulk without increasing its weight. The finer we are able to divide these flakes the more effective they become, as each one in itself is an effective non-conductor.

The mats, or quilts, are not only fireproof, but are flexible and elastic, which is a most valuable feature, as they will expand or contract with the iron or steel they cover without cracking or flaking off. The real value, however, in making these mats in sections, is that they can be removed whenever it is desirable to examine the shell of the boiler, and can be replaced easily and quickly without injury.

They are secured to the boiler by means of hooks attached to iron bands, which are passed round the boiler under the mats. Besides this covering for boilers, the waste mica is made into sectional covering for all sizes of steam and hot-water pipes, the only difference being that the mica is stitched between a wire core which fits the pipe, and an outer covering of canvas.

Nail Production in 1896.

The production of iron and steel wire nails in the United States in 1896 amounted to 4,719,860 kegs of 100 pounds each, compared with 5,841,403 kegs in 1895, a decrease of 1,121,543 kegs, or over 19 per cent. In 1894 the production amounted to 5,681,801 kegs and in 1893 to 5,095,945 kegs. The wire nails produced in 1896 were manufactured by seventy-three works, thirty-one more than were in operation in 1895. The production of 1896 represented 210,708 gross tons.

The total production of cut nails in 1896 was 1,615,870 kegs of 100 pounds each, against 2,129,894 kegs in 1895, a decrease of 514,024 kegs, or over 24 per cent. There has been a steady decline in the production of cut nails since 1886, in which year the maximum production of 8,160,973 kegs was reached. In 1896 the production of wire nails exceeded the production of cut nails by over 3,103,000 kegs. The production of cut nails in 1896 represented 72,137 gross tons. Eleven states made cut nails in 1896.

The Largest Swing Bridge.

The Sanitary Trustees of Chicago will build the largest swing bridge in the world across the drainage canal at Thirty-first street and Campbell avenue. Its total length will be 400 feet 5 inches, and its width will be 120 feet. The height of the center columns will be 68 feet; headway under the trusses for trains, 21 feet; headway under the bridge, 18 feet, and depth of water in the channel, 24 feet. The bridge will be of steel, weighing 7,000,000 pounds. It will be capable of supporting a trainload of 8,000,000 pounds. The total cost is estimated at $700,000, including the machinery. Three railways will use the structure, crossing on eight tracks. The turn-table will have a diameter of 80 feet, and the bridge will be swung in one minute, probably by electric power.

It is stated by one of the heads of departments of the London and Northwestern Railway that that company issues yearly fifty tons of railway tickets.

DIVIDEND NOTICE.

The German Savings and Loan SOCIETY,

526 California Street.

For the half year ending June 30, 1897, a dividend has been declared at the rate of four and twenty-hundredths (4.20) per cent per annum on Term Deposits and three and fifty-hundredths (3.50) per cent per annum on Ordinary Deposits, free of taxes, payable on and after THURSDAY, July 1st, 1897. GEO. TOURNY, Secretary.

DIVIDEND NOTICE.

San Francisco Savings Union,

532 California Street, Corner Webb.

For the half year ending with the 30th of June, 1897, a dividend has been declared at the rate per annum of four and two-tenths (4.2) per cent on Term Deposits and three and five-tenths (3.5) per cent on Ordinary Deposits, free of taxes, payable on and after THURSDAY, July 1st, 1897.
LOVELL WHITE, Cashier.

British Columbia.

E. S. TOPPING, TRAIL, B. C.,

Has prospects for sale in Trail Creek and the whole of the Columbia basin. Will buy legitimate stock and mines for investors. Will examine mines. Has lots for sale in Trail and Deer Park.

MINE BELL SIGNALS. Adopted, Used and in Force in Accordance with State Law.

FOR THE CONVENIENCE OF OUR READERS IN THE MINING COUNTIES WE PRINT IN legal size, 12x36 inches, the Mine Bell Signals and Rules provided for in the Voorhies Act, passed by the State Legislature and approved March 8, 1893. The law is entitled "An Act to Establish a Uniform System of Mine Bell Signals to Be Used in All Mines Operated in the State of California, for the Protection of Miners." We furnish these Signals and rules, printed on cloth so as to withstand dampness, for 50 cents a copy. MINING AND SCIENTIFIC PRESS, 330 Market St., San Francisco.

Cheap Power!

SAVE MONEY BY USING

—THE—

"DANIEL BEST" Crude Oil Engine.

This Engine can be operated on either Crude Oil, Distillate, Gasoline, or Kerosene. **It is the cheapest power on earth** and is not tied to any one kind of Oil, but can use any kind that will make gas and is not handicapped by being compelled to use a certain Oil. Do not forget this when in need of an Engine.

We guarantee our Engines to work perfectly on California Crude Oil, or Distillate, or any other kind of gaseous Oil; we however prefer CALIFORNIA CRUDE OIL, from Coalinga, Fresno county, for the reason that gas from Crude Oil will produce more power from the number of feet of gas used than from any other Oil, and it is also a natural lubricant as well, the valves being always lubricated sufficiently to prevent them from sticking, thus assuring greater durability of the working parts than it otherwise would be in using dry gas. And another advantage we claim is, that danger from explosions is reduced to a minimum, there being no accumulation of gas, but is used by the Engine as fast as it is generated and hence is absolutely safe. The following is a test that we made with one of our Five-Horse Power Crude Oil Engines, running ten hours on the different gas oils:

California Crude Oil, 40 grav.,	7½	gals. at	8c.,	$.37½
Distillate	40	"	7½ "	8c., .60
Domestic Coal Oil	40	"	7½ "	12½c. .93¾
Gasoline	74	"	8¾ "	15c., 1.31¼
City Gas	1000	feet,		2.00

We manufacture all sizes from two-horse power up, and will guarantee that our Engines will run cheaper and are more simple in construction, have fewer parts and hence are more durable than any other Gas Engines on the market. Seeing is believing; don't take our word for it, but come and investigate for yourselves. You can always see one in operation at our works. We will be pleased to see you and will at all times take pleasure in showing them up. Our Engines are specially adapted for running well and mining machinery—in fact, for any kind of power desired. We are the pioneers and first inventors of Crude Oil and Distillate Engines. We always lead and never follow. Send for Catalogue and Price List of the only genuine Crude Oil and Distillate Engine made.

PROSPECTING BATTERY.

UNION IRON WORKS,

222 Market Street, San Francisco, Cal.

THIS : :

Two-Stamp Self-Contained Battery

IS DESIGNED BY

THE UNION IRON WORKS

Expressly for Prospecting Work.

It was awarded First Prize at the recent Mechanics' and Manufacturers' Fair, where it was in daily operation, crushing ores from various mines throughout the State.

Weight of stamps, 275 pounds each; capacity of battery, determined by actual work, 200 pounds per hour, through a No. 7 slot-punched screen.

Entire battery weighs about 3000 pounds; heaviest piece, mortar, weighing 1200 pounds.

Can be taken apart and transported to any locality.

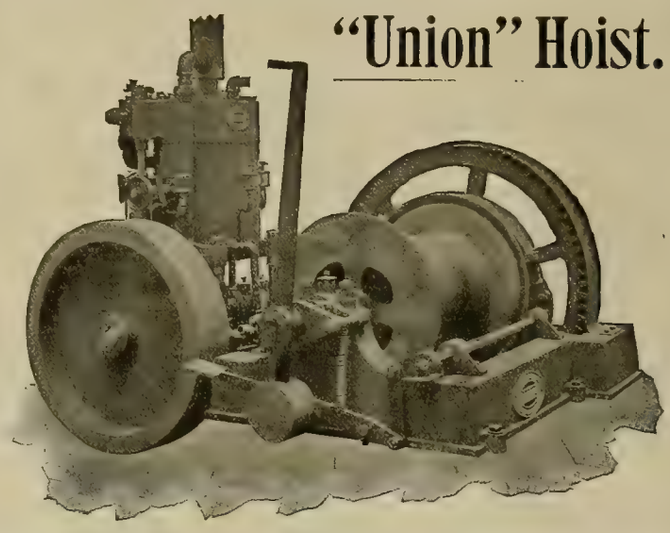
These wheels are durable, highly efficient, and are the only wheels which have perfect regulation, which feature makes them especially suitable for the operation of electric machinery.

"Union" Hoist.



The above cut represents our 10 h. p. Double Cylinder Engine of latest type, and Hoist combined on strong iron base. This hoist is designed to raise one ton125 feet per minute from an inclined shaft, or 1500 pounds at the same speed vertical lift. The drum will hold over600 feet of ⅝-inch cable. The outfit weighs 3500 pounds.

THE UNION GAS ENGINE CO.

—BUILD THE—

"Union" Gas Engines,

Which use either Manufactured or Natural Gas, Ordinary Stove Gasoline (Naphtha or Benzine), Distillate or Kerosene.

STATIONARY ENGINES for All Kinds of Work, Built in Sizes from 3 to 200 h. p.
"UNION" COMBINED HOISTS in Sizes from 2 to 40 h. p.
"UNION" COMBINED COMPRESSORS—20, 30, 40 h. p.
HOISTS and COMPRESSORS Can Be Built in Larger Sizes to Order.
"UNION" MARINE ENGINES, 4 to 200 h. p., of Single, Double and Four-Cylinder Types.
TEN YEARS' EXPERIENCE Building Gas and Oil Engines.
"UNION" ENGINES Are In Use All Over the United States.
"UNION" ENGINES Are Simple, Durable and Economical.

Office: 314 HOWARD ST., SAN FRANCISCO, CAL.

Coast Industrial Notes.

—Flagstaff, Arizona, will spend $100,000 for water works.

—City expenses will cost San Francisco $5,756,371 this year.

—During June San Jose, Cal., shipped 3,000,000 pounds of cherries.

—The Mexican Sulphur Co. proposes to erect a plant at Ventura, Cal.

—A railroad will be built this summer between Fort Thomas and Globe, Arizona.

—The San Francisco Chamber of Commerce will memorialize Congress in favor of Hawaiian annexation.

—The Garlick Company will supply Keswick, Shasta Co., Cal., with water from Spring creek.

—Over 20,000 visitors are expected on this coast next week, the fare from Chicago —2600 miles—being $25

—The Torrens system of land transfers was adopted at the last session of the California legislature and is now in force.

—The East Riverside, Cal., Company will use an electric pumping plant to supply water for irrigation along its system of ditches.

—A thousand tons of tea of the new crop has been landed in Tacoma, Wash.; 12,000,000 pounds are now on the ocean between Yokohama and that port.

—It is thought that the present extraordinarily low passenger rates between San Francisco and northern ports will be raised during this month.

—The parties holding the concessions for building a railroad from Deming south into old Mexico have surveyors in the field traversing the proposed route.

—At Colton, Cal., the fruit cannery was reopened this week. The cannery employs 400 hands and puts out 35,000 cans of fruit daily. They expect to run five months.

—The Bibb Lumber Co. has a contract with the Chinese Government for 10,000 M. feet railway ties and 7,000 M. feet stringers for building a railroad through Manchuria, China. The lumber is to be delivered at Tien-tsin.

—When the frost came on Florida the orange industry of that State had grown to 5,000,000 boxes, while California then produced but about 1,500,000 boxes. The Los Angeles *Times* says: "It appears now that, barring accidents, southern California can count on harvesting 4,000,000 boxes this year."

—On July 1st the Atlantic & Pacific Railway went out of existence. The line from Mojave, Cal., to Albuquerque, N. M., is now known as the Santa Fe Pacific Railroad. The line from Benson to Guaymas now belongs to the S. P. Co. J. J. Byrne is the general passenger agent of the new Santa Fe Pacific, with headquarters at Los Angeles, Cal.

—The Union Construction Company is organized at Phœnix, Arizona. Capital, $100,000. Incorporators, J. W. Beckley, Rochester; A. Smith, New York; A. A. Daugherty, Los Angeles. The company is supplemental to the Randsburg Railroad Company, formed several months ago for the construction of a railroad from Kramer, on the Atlantic and Pacific, to Randsburg, a distance of twenty-seven miles. The local representative of the corporation states that the new road will be in operation by August 15th.

—The engineers at Newtown shoals, where the Sacramento enters Suisun bay, have sounded to a depth of 18 or 20 feet below low water and encountered only sand. One report is to the effect that hardpan was struck under the sand. This is supposed to be packed or cemented sand. Engineer Price believes that the substance, whatever it may be, should be removed in order to stimulate the current of the river. He holds that dynamite would readily loosen the packed sand and the current would do the rest of the work.

Recent California Mining Incorporations.

Murchie Drift Gravel M. Co., San Francisco; C. L. Benton, C. A. Cole, F. Hiller, J. C. Brown, G. T. Emery; capital stock, $300,000; $1500 subscribed.

Old Virginia M. and M. Co, San Francisco; W. F. Drake, G. Strauss, C. T. Ryland, J. G. Hopper, C. A. Stubbs, H. Harvey, J. E. Gabriel; capital stock, $200,000; subscribed, $700.

Recently Declared Mining Dividends.

Tamarack Copper Co., Michigan, $180,000; payable June 30.

Osceola Copper Mining Co., Michigan, $50,000; payable July 26.

Ontario, Utah, $15,000; payable June 30. Total to date, $13,445,000.

Le Roi, Rossland, B. C., $25,000; payable June 30. Total to date, $425,000.

Recent Publications Received.

"*The Brownstones of Pennsylvania*" is the title of a report on this subject just issued from the Mining School of the Pennsylvania State College. It contains 125 pages of text besides twenty-six page plates of illustrations and two maps. It shows care in preparation and contains valuable information on the subject. The author, Mr. T. C. Hopkins, is an expert on the subject of building stones, having published several monographs on the subject in the Government and different State geological survey reports, and numerous shorter articles in the scientific and trade journals.

Personal.

LOUIS JANIN JR. has returned to Sidney.

C. M. RALKER is in Montana and will come on to Idaho.

UPON John Muir the University of Wisconsin has conferred the degree of LL. D.

J. H. COX has been appointed superintendent of the Trinity Consolidated, Delta, Cal.

JUDGE JOHN CALDERWOOD has been appointed manager by the Boston & Colorado Gold Mining Co.

J. H. COX has been appointed superintendent of the Trinity Consolidated mine at Delta, Trinity Co., Cal.

SIMON & WILLIAM GUGGENHEIM, the smelter owners, went up to British Columbia last week to look at the mines.

ALLEN C. WASHINGTON, president of the Horn Silver Co. of Utah and Anson Phelps Stokes from New York are in eastern Nevada.

EX-GOVERNOR GEORGE BLACK has been appointed one of the commissioners for the classification of Northern Pacific mineral lands in Idaho.

A. T. DUNBAR has associated himself with C. H. Chase in the management of the New York Belting & Packing Co., Ltd., 509 Market St., San Francisco.

PROF. SAMUEL F. EMMONS of the United States Geological Survey will shortly go to the Tintic district, Utah, to take charge of a survey of the mineral belts there.

Commercial Paragraphs.

THE San Francisco branch office and warehouse of Park Brothers & Co., Limited, Pittsburg, Pa., "Black Diamond" Steel Works and Lake Superior Copper Mills, has this week removed to the new building 324 and 326 Howard Street, between Beale and Fremont.

E. A. RIX has sold out his stock in the Rix Compresssed Air Machinery Company, and has opened a new business under the title of the Rix Engineering and Supply Co. at 507 Market street. He has just contracted with the Black Oak mine for a 100 H. P. compressor plant with 14-foot direct connected water wheel, and with the Gwin Mining Co. for the first half of a 500 H. P. plant with duplex 18 x 24's and 16-foot direct connected water wheel attached. This plant will be for pumping from the mine at an elevation of 1200 feet Compound pumps will be employed and a unique method of reheating. In addition to carrying on the compressed air business Mr. Rix has made a connection with one of the large electrical companies and will install electrical plants where they fulfill the requirements better than compressed air. The Cramp-Hoadley Co. have placed their agency also with Mr. Rix, and this places with him the American Wheelock engine, the most economical of steam engines in this market, and also the products of several other manufacturers.

Spadone's Concentrator Belts. Patented.

The "SPADONE" Curved Edge Concentrator Belt is attracting much attention among mining men, its merits appealing to the millman of practical experience.

Illustration (Fig. 1.) shows a cross-section, and (Fig. 2.) shows the edge flanging outwardly as it passes over the pulley. This relieves the strain from the top and bottom of the edge by directing the strain automatically to the inside face surface of the edges. Heretofore all belts have been so constructed that when they pass over the pulleys or rolls, a direct strain comes upon the top or at the base of the edges, causing the edges to break away from the body of the belts in a very short time. *We avoid this Mechanical Defect by our Spadone Curved Edge.* Belts made to fit any machine—4, 5 and 6 feet wide. Prices and samples on application.

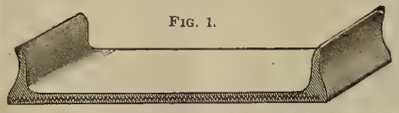

FIG. 1.

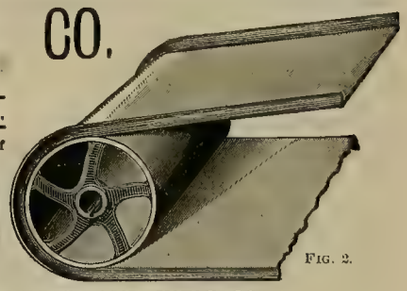

FIG. 2.

We shall be pleased to quote you also on Water, Air Drill, Steam, Suction and Fire HOSE, RUBBER BELTING and RUBBER PACKING. Correspondence Solicited.

WELLS, RUSSELL & CO., Mechanics' Mill, Cor. Mission and Fremont Sts., San Francisco, Cal.

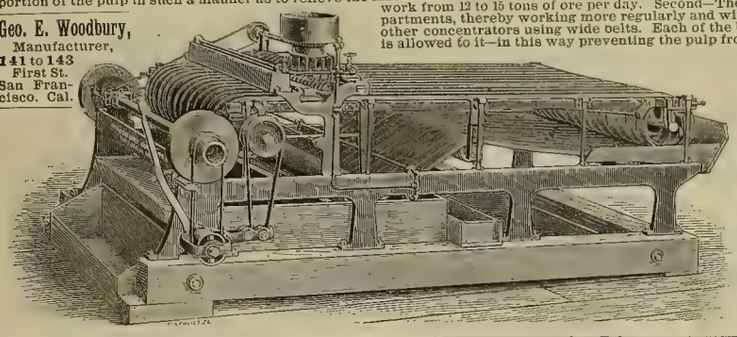
THE WOODBURY ORE CONCENTRATOR WITH IMPROVED BELTS

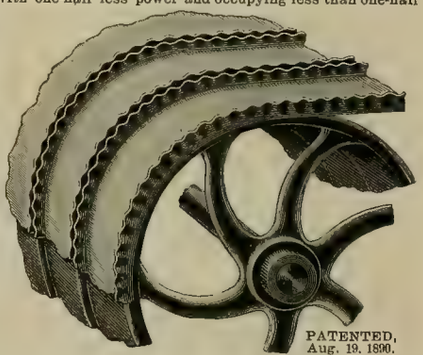
was awarded the Highest (Bronze Medal) Premium at Mechanics' Institute, 1890 and 1891.

MORE THAN DOUBLE THIS CAPACITY with one-half less power and occupying less than one-half the space of any other concentrator. Built of best Steel and Wrought Iron. Strong and durable. **Price $575 f. o. b.** Send for Catalogue and Testimonials.

The annexed cut shows the belt in its improved form, which consists of corrugated edges, to form an expanding top edge. THE IMPROVED MACHINE HAS THE FOLLOWING MERITS: First—The improved belts, which consist of seven, are constructed and arranged so as to allow each belt to receive a portion of the pulp in such a manner as to relieve the machine of its load, thereby giving it twice the capacity of other concentrators, and enabling it to work from 12 to 15 tons of ore per day. Second—The machine equalizes the load by several compartments, thereby working more regularly and with much less attention than is necessary to give other concentrators using wide belts. Each of the belts on this machine takes care of the pulp that is allowed to it—in this way preventing the pulp from running to the lower side of it, as is the case when a machine becomes out of level where wide belts are used. Third—The belts run on a perfect line, needing no adjustment to prevent their running from side to side, as in other concentrators. Fourth—The belt surfaces are improved by indentations and corrugations, causing the Concentrator to save fine sulphurets and quicksilver, and perform close work. Fifth—The belts have fluted or corrugated edges, to form an expanded top edge, which effectually prevents from cracking. Sixth—The feed arrangement is perfect. Seventh—The machine is constructed of iron, with steel crank-shaft self-oiling boxes, and everything made in the most thorough manner, enabling it to run with very little attention or wear.

Geo. E. Woodbury,
Manufacturer,
141 to 143
First St.
San Francisco. Cal.





PATENTED, Aug. 19, 1890.

This Concentrator took the 1st prize at the San Francisco Mechanics' Institute in 1890, 1891 and 1892, and at the California State Fair in 1892; it took the 1st, prize at the World's Columbian Exposition 1893, and at the San Francisco Midwinter Fair, 1895.

ASPEN, COLORADO, April 8, 1897.

The Mine and Smelter Supply Co., Denver, Colo.—GENTLEMEN: Your favor of the 5th inst. at hand and noted. In regard to the Wilfley Table I wish to say that I consider it to be the best device in use to-day for concentrating fine ores; that it will save everything that a gold pan will; that it combines the clean saving of a Rittinger with the capacity of a buddle. I think that without question it will supplant in time all other devices for handling fine and slimy ores. This includes all the vanning machines and buddles.

This is higher praise than I am in the habit of giving, but I feel sure that it is deserved, and you may make any use of this that you desire. Yours very truly,

[SIGNED] S. I. HALLETT.

These Tables have displaced belt tables of almost every make, as is shown by letters in our possession.

OF EVERY DESCRIPTION.
All work tested and guaranteed.

IMPROVED PORTABLE HOISTING ENGINES.

Improved Self-Contained Three or Five Stamp Mill,

Saves bill for heavy timbers, millwright and mechanics' labor, and a large amount of space. The term self-contained means a great deal for the mine owner, and can be readily recognized and appreciated in making an estimate for an ordinary plant when the comparative cost is considered.

FIRST: There is saved a large bill for heavy timbers, in many instances obtained at great expense and loss of time.

SECOND: The saving in millwright and mechanics labor in framing and erecting.

THIRD: The large amount of space saved.

FOURTH: The great saving of freight,

Send for Circulars and Price List.

OSBORN'S PROSPECTOR'S FIELD-BOOK AND GUIDE.

Third Edition, Revised and Enlarged.

JUST READY.

The Prospector's Field-Book and Guide in the Search for and the Easy Determination of Ores and Other Useful Minerals, by Prof. H. S. Osborn, LL. D. Author of "A Practical Manual of Minerals, Mines and Mining." Illustrated by 58 Engravings. Third Edition, revised and enlarged.

In One volume, 12mo, cloth, 255 pages, price $1.50 free of postage to any address in the world.

CONTENTS—Chapter I. Preparatory Instruction; II. Crystallography; III. Surveying; IV. Analyses of Ores—Wet Method; V. Special Mineralogy (Gold; VI. Platinum, Etc.—Silver; VII. Copper and How Measured in Ores; VIII. Lead and Tin; IX. Zinc—Iron; X. Mercury, Bismuth, Nickel, Cobalt, and Cadmium; XI. Aluminium, Antimony, Manganese, and Other Minerals; XII. Petroleum, Ozocerite, Asphalt, Peat; XIII. Gems and Precious Stones. Appendix: Weights and Measures; Specific Gravity; Boring; Chemical Elements; Glossary, etc.

Price $1.50, by mail, free of postage to any address in the world.

☞ *A Descriptive Circular 4 pages, quarto, giving the full Table of Contents of the above volume, sent free to any one in any part of the world who will furnish his address.*

☞ *Our New and Revised Catalogue of Practical and Scientific Books, 94 pages, 8vo., and our other Catalogues, the whole covering every branch of Science applied to the Arts, sent free and free of postage to any one in any part of the world who will furnish us with his address.*

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

VOTING MACHINE.—Christ Christensen, East Oakland, Cal. Assignor to the California Voting Machine Company, of San Francisco, Cal. No. 584,494. Dated June 15, 1897. This invention relates to an apparatus which is designed to mechanically indicate the choice of a voter from a list of candidates, and means of registering the same, and totalizing the entire number of votes cast for each of the candidates. It consists of a casing containing the registering mechanism, mechanism to prevent more than the requisite number of votes being cast for any one office, having exposed for the manipulation of the voter a series of keys and a corresponding list of the names of candidates for each of the offices to be voted for, a means for locking the keys so that but one vote can be cast for any one individual, and means for allowing the requisite number of votes to be cast for offices where more than one is to be voted for. The keys to be operated by the voter are rotatable, and are fixed upon the ends of screw-threaded rods which, when turned, advance the indicators and show the number of votes by the position of the indicators upon the figured index behind. The keys are segmental, having a straight portion upon one side, and there are blocks slideable with relation to these straight edges so as to prevent the keys from being turned when the blocks stand opposite to them. The number of these locking blocks equals the number of candidates less the number to be voted for, and they can be moved so as to allow the voter to turn the key corresponding with the name or names he desires to vote. In conjunction with this mechanism is a returning device by which, after the voter has left the booth, all the parts may be returned to their normal position.

BROOM CORN SIZING MACHINE.—J. M. Gaffney and J. J. Fischer, San Francisco, Cal. No. 584,499. Dated June 15, 1897. This invention relates to a class of machines for sizing or sorting broom corn into lengths. It consists in the novel construction, arrangement and combination of the parts of the machine, so that the broom corn can be accurately sized and sorted. This object is attained by supporting the corn fiber upon a firm bed or table having an inclined side with means for receiving and advancing the broom corn over the bed or table, a series of rotatable devices arranged in pairs parallel with the inclined side of the bed so that they may be set at successively different distances from the path of travel of the broom corn and receive successively different lengths between them and withdraw the lengths. Stationary pins are fixed in the table to check the progress of the corn after it has been engaged by the devices.

CONCENTRATOR BELT ADJUSTMENT.—George Gates, Jackson, Cal. No. 584,502. Dated June 15, 1897. This invention relates to a device for adjusting endless traveling concentrator belts. In the employment of the long endless traveling belts of considerable width, the varying weight of material which may at times be brought upon one side or the other of the belt will stretch it irregularly so that it is apt to run off the drums. This invention is designed to correct this difficulty, and it consists in the employment of a roller or rollers adapted to press upon the lower part of an essentially loose or slack belt, with a means for changing the angle of the roller obliquely to the belt so that it will be caused to travel to one side or the other as may be desired.

CONCENTRATOR BELT.—George Gates, Jackson, Cal. No. 584,501. Dated June 15, 1897. This invention relates to an improved concentrating belt, and consists essentially in the novel construction of the belt and its raised or upturned edges. Belts of this class are made endless, adapted to travel over drums or rollers at the ends and receive the pulp or material to be concentrated so that, in conjunction with water, it flows down the belt while the belt travels upward against the current and passes continually around the rollers at each end, the sulphurets being cast off at the upper end and the lighter material discharged at the lower end. The constant stretching and straightening of these edge ribs in most constructions of such belts causes them to crack and break in time, and my invention is designed to so construct this rib as to allow it to compress when a belt is passing around the rollers without such a stretching as would be apt to tear or break the flanges. The flanges in this construction are made substantially of the same thickness throughout, and are extended upwardly and outwardly from the body of the belt, joining at their upper limits by short inclined walls which form, with the inner and outer walls of the flanges, acute angles in which the apex is approximately vertical in line with the point on the belt where the base of the outer inclined wall meets the horizontal bottom line of the belt.

Are always the **CHEAPEST.** All the latest and best works on **Mining, Metallurgical, Electrical and kindred subjects** can always be obtained through the office of the MINING AND SCIENTIFIC PRESS. Below will be found a list of standard books in their various lines. If you do not find what you want in it, send for catalogue and price list of **Standard Mining Works and Scientific Publications.**

MINING AND SCIENTIFIC PRESS,
220 Market Street ..... San Francisco, Cal.

Assaying.—Part I—Gold and Silver Ores.
Third edition: Just Out. Rewritten and Improved by the Author, C. H. Aaron. Embraces 130 12-mo pages, with illustrations; well bound in cloth; 1898. Price, postpaid $1 00

Assaying.—Parts II & III—Gold and Silver Bullion, Lead, Copper, Tin, Etc.
Latest edition. Contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter. Price, postpaid.....$1 75

Notes on Assaying and Assay Schemes.
By P. De Peyster Ricketts, E. M., Ph. D., Professor in Assaying in the School of Mines, Columbia College, N. Y. Prepared with special reference to the wants of the student and practical assayer. Containing also Rules for the Examination of Mines, Assayer's Outfit, Treatment of Ores, etc. Fifteenth edition. 8vo., cloth.....$3 00

Prospector's Field Book and Guide.
By H. S. Osborn.....$1 50

A Practical Guide for Prospectors and Miners
By C. W. Moore. With numerous Illustrations.....$4 75

Roasting of Gold and Silver Ores and the Extraction of their Respective Metals Without Quicksilver.
Second edition. By Guido Kustel, M. E. Contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. Price, postpaid.....$3 00

The Lixiviation of Silver Ores with Hyposulphite Solutions.
With special reference to the Russell Process. Second edition. Completely revised. By Carl A. Stetefeldt. Price, bound in cloth.....$5 00

Modern Copper Smelting.
By Edward Dyer Peters, Jr. Seventh edition. Rewritten and enlarged. Profusely illustrated....$5 00

Electricity in Mining.
By Sylvanus P. Thompson..... 80 cts.

Practical Treatise on Hydraulic Mining.
By Aug. J. Bowie, Jr. On the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on heavy grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. Price, postpaid.....$5 00

Practical Hydraulics.
A book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers and Irrigators. By P. M. Randall. Contains useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulæ, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules and tables are prepared. Is specially applicable to the Pacific Coast. Price, postpaid, $2

The Metallurgy of Silver.
By M. Eissler. Profusely illustrated.....$4 00

Manual of Mining.
For the use of Mining Engineers and Technical Schools. Treating of Preparatory and Exploratory Work, Methods of Mining, Hoisting Machinery, Pumping, Ventilation Shafts, Tunnels, Blasting, Timbering, etc., etc. By Prof. Magnus C. Ihlseng, E. M., Ph. D. Second edition, with Appendix. 500 pages, 8vo., cloth.....$4 00

The Explorer's and Assayers' Companion.
A third edition of selected portions of the "Explorer's, Miner's and Metallurgist's Companion." By J. S. Phillips, M. E. A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying and Metallurgy. Price, postpaid.....$6 00

Aaron's Leaching Gold and Silver Ores.
By C. H. Aaron. The most complete handbook on the subject extant; 164 pages, octavo. Illustrated by twelve lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, postpaid.....$3 00

Manual of Assaying—Gold, Silver, Copper and Lead Ores.
By Walter Lee Brown, B. Sc. One colored plate; 132 illustrations on wood. Fifth edition. 12 mo. 533 pp. Price, postpaid.....$2 50

The Metallurgy of Gold.
By M. Eissler. Profusely illustrated.....$5 00

A Text Book of Mineralogy.
Based upon the System of Mineralogy of Prof. J. D. Dana. Embracing an extended Treatise on Crystallography and Physical Mineralogy. By Edw. S. Dana, Curator of Mineralogy, Yale College. With upward of 800 woodcuts and one colored plate. Seventeenth edition. 8vo., cloth.....$3 50

Notes on the Treatment of Gold Ores.
By Florence O'Driscoll, Associate Member of Institute of Civil Engineers. 8vo., cloth.....$2 00

A Practical Manual of Minerals, Mines and Mining.

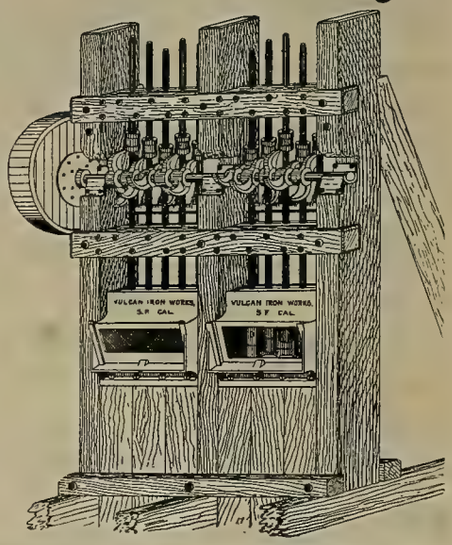
Mining Machinery.

Stamp Mills

Of the Latest Improved Design for

Gold Milling.



VULCAN WIRE ROPEWAYS

For Conveying Ore, Etc.

Vulcan Iron Works,

Office: 505 Mission Street, San Francisco, Cal.

IF YOU HAVE A SMELTER--YOU WANT IT.
IF YOU HAVE A COPPER MINE--YOU NEED IT.
IF YOU HAVE A CYANIDE PLANT--YOU OUGHT TO HAVE IT.
IF YOU OWN CHLORINATION WORKS--YOU SHOULD BUY IT.
IF YOU ARE INTERESTED IN A MINE OR MILL--YOU CAN'T DO WITHOUT IT.

What? P. & B. Paint.

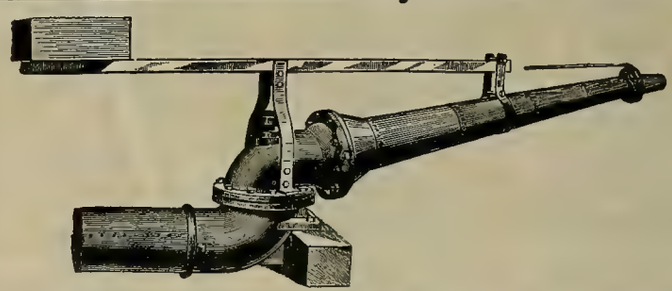
IT IS ABSOLUTELY ACID PROOF---TRIED AND PROVEN.

Manufactured by

PARAFFINE PAINT CO., San Francisco. Los Angeles.

You Can Order It From Your Dealer.

Double-Jointed Ball-Bearing Hydraulic Giants.



The above presents an improved **Double-Jointed Ball-Bearing Hydraulic Giant** which we build. The improvement consists of the introduction of a **Ball Bearing** by which the pressure of the water is reduced to a minimum and the direction of the nozzle changed at will with ease.

Catalogues and prices of our specialties of HYDRAULIC MINING MACHINERY furnished upon application. **JOSHUA HENDY MACHINE WORKS, 38 to 44 Fremont St., San Francisco, Cal.**

ADAMANTINE SHOES AND DIES

—AND—

CHROME CAST STEEL

Cams, Tappets, Bosses, Roll Shells and Crusher Plates.

STAMP SHOES.

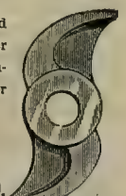
STAMP DIES.

These castings are extensively used in all the mining States and Territories of North and South America. Guaranteed to prove better and cheaper than any others. Orders solicited subject to the above conditions. When ordering, send sketch with exact dimensions. Send for Illustrated Circular.

Manufactured by CHROME STEEL WORKS, Brooklyn, N. Y.

H. D. MORRIS & CO., Agents, 141 and 143 First Street, San Francisco.

Special attention given to the purchase of Mine and Mill Supplies.



Stamp Cam.

Market Reports.

The Markets.

SAN FRANCISCO, July 1, 1897.

Business in every branch of trade is steadily enlarging, but the margin of profit has been cut so as to be completely wiped out in some lines. This is expected to change for the better as buying increases. The belief prevails that there will be a large influx of merchants and miners within the next ten days, which will help to improve trade. With manufacturers there is nothing new to report. The larger institutions report large contracts in hand. The Union Iron Works are turning out some heavy machinery for the Anaconda mine. These works have added over $360,000 worth of the latest improved labor-saving machinery, selling that grown obsolete. This enables the best of work at low figures, so as to compete successfully with the largest works at the East or in Europe. They have in hand contracts calling for over $6,000,000. From the general tenor of information it seems quite reasonable to assert that in structural machinery and other iron work there is more doing than at the corresponding time for several years past.

The local money market is steadily working to more ease, although two or more of the banks still prefer hoarding to letting out funds. Outside capitalists are coming in more freely and taking the better loans. They believe that lower rates of interest will have to rule. Collections are reported easy for the season of the year. There is more money going out for crop moving purposes, but this soon goes into circulation and finds its way back to the general reservoirs. There is very little speculation at present, but this is expected to change before long. Remitting money to the East is still quite free, which keeps New York bills strong. New York advices continue to note an active market, with a free call for funds. There is considerable speculation in railroad and industrial securities. Advices are also to the effect that business is steadily reviving, but it will take time to recover from the late depression. European advices continue to note more doing in American securities, but the volume is not yet sufficient to overcome the heavy importation of goods by the United States, and the difference will have to be met later on by exporting gold.

New York Silver Prices.

NEW YORK, July 1.—Following are the closing prices for the week:

	Silver in London.	Silver in N. Y.
Friday	27 9-16	60⅛
Saturday	27 9-16	60⅛
Monday	27¾	60⅜
Tuesday	27⅝	60⅛
Wednesday	27 9-16	60⅛
Thursday	27 9-16	60¼

	Copper.	Lead.	Iron.	Tin.
Fri.	11 00 @11 25	3 35	10 00@12 25	13 97½
Sat.	11 00 @11 25	3 35	10 00@12 00	14 00
Mon.	11 00 @11 25	3 40	10 00@12 00	14 00
Tue.	11 00 @11 25	3 45	10 00@12 00	14 10
Wed.	11 00 @11 25	3 55	10 00@12 00	14 10
Thur.	11 00 @11 25	3 55	10 00@12 00	14 10

The local bullion, money and exchange quotations current are as follows:

Commercial Loans, % per annum	7@8
Commercial Loans, prime	6@8
Call Loans, gilt edged	6@7
Call Loans, mixed securities	7@8
Mortgages, prime, taxes paid by lender	6@8
New York Sight Draft	17½c Prem
New York Telegraphic Transfer	20c Prem
London Bankers' 60 days	$4.87
London Merchants	$4.85
London Sight Bankers	$4.88
Refined Silver, per oz., 1000 fine	60⅝
Mexican Dollars	49@49¼

SILVER.—The market advanced slightly, but did not retain the firmness over one day. Our Eastern and European advices are to the effect that there is an entire absence of any move that looks like speculation. The steadiness of the market in the absence of a free movement shows that holders on this side are not pressing for a market, but sell as required. It is the impression that China will take increased quantities soon, as the new season tea and rice crops is on now. The steamer for Hongkong hence June 26th took out in silver bullion 71,600 ounces for China and 63,000 ounces for Bombay.

MEXICAN DOLLARS.—The market shows a slight improvement in the call. The last steamer for China took 157,580 dollars.

QUICKSILVER.—The market is slightly lower. The demand is reported fully up to if not ahead of that ruling at this time in 1896. Our market is quoted at $40 for domestic consumption.

COPPER.—The market shows more strength at the East and abroad, but with us there is very little change to note. There have been few imports of ingots the past week which indicates an increasing consumption. The East reports a firm market with the American demand improving. England continues to advise of free consumption in all European countries. The demand is for legitimate wants.

The local market is quoted as follows:

Ingot, jobbing	—@14
Ingot, wholesale	—@13
Sheet copper	—@17
Bolt	¾ and 5-16, 20c; ⅜ and larger, 17

TIN.—In our market there is nothing new to report. At the East and abroad the markets have gained strength closing strong at an advance. Although we do not quote higher yet in our market prices will be advanced when the cheaper lots are out of the way.

We quote as follows in a jobbing way:

Pig, per lb	—@ 15
Plate, I C coke, heavy, per box	$4 10@4 25
" " " light, "	4 00@—

LEAD.—The market is strong at higher figures. The consumption is free. The East reports steadily advancing markets, closing strong. The consumption at the East, it is said, shows quite a decided increase over that at the corresponding time last year.

Our market is quoted in jobbing lots as follows:

Pig	4 10	@	4 35
Bar	—	@	4 60
Sheet	5 75	@	6 25
Pipe	5 00	@	5 50

SHOT.—In sympathy with lead, the market is expected to sell higher.

Our market is quoted as follows:

Drop, sizes smaller than B, per bag of 25 lbs	$1 35
Drop, B and larger sizes, " "	1 60
Buck, Balls and Chilled, do, " "	1 60

POWDER.—There is nothing new to report. The demand continues strong.

The market is quoted as follows for Hercules: No. 1, from 11¾c to 17¼c, according to strength and quantity; No. 2, from 9c to 11c, according to strength and quantity.

BORAX.—The market is steady.

The market is quoted as follows:

Refined, in carload lots, in barrels	5
Refined, in carload lots in sacks	4¾
Powdered, in car lots	5
Concentrated, "	4½

IRON.—Our market is practically unchanged. At the East the market is slightly lower notwithstanding a heavy movement.

AMERICAN.

	To Arrive.	Spot.
Sloss	$20 00	$22 00
Thomas	21 00	22 00
Salisbury	29 00	31 50

ENGLISH.

Barrow	$21 00	$23 00
Gartsherrie	21 50	23 00

COAL.—The bark Theobald from Cook's Inlet, Alaska, to North Pacific Mining & Transportation Co., brought in the past week 1000 tons of coal, which is of superior quality and is equal in every respect to the best mined on the coast. So say experts. The prospects of a 62½-cent duty on coal will make its influence felt later on, or so soon as supplies on hand at time duty goes into effect are exhausted.

We quote as follows:

SPOT FROM YARD—PER TON.

Wellington	$8 00@— —
Greta	6 00@ 6 50
Nanaimo	6 50@ 7 00
Gilman	5 50@ 6 00
Seattle	5 50@ 6 00
Coos Bay	—@ 4 75

TO ARRIVE—CARGO LOTS.

Australian	5 50
Liverpool Steam	6 25
Scotch Splint	—
Cardiff	6 25
Lehigh Lump	9 00
Cumberland	13 00
Egg, hard	10 00
West Hartley	6 50

COKE.—The market is quoted as follows:

Gas Companies'	— —		— —
English, to load	9 50	@	— —
" spot, in bulk	10 00	@	— —
" in sacks	11 00	@	12 00
Cumberland	— —	@	— —

ANTIMONY.—The market is steady.

Our market is quoted at 7¼@8¼c in a jobbing way. New York mail advices quote 7½c for Cookson's, 6⅞@7⅛c for Hallett's and 6⅞@7c for Japanese.

NAILS.—The market is strong and active.

Wire, carloads, basis per keg	—
" jobbing, " "	$2 35
Cut, carloads, " "	—
" jobbing, " "	2 25

PLATINUM.—Very little doing.

Our market is quoted in a jobbing way at $10 to $15 per ounce.

ZINC.—The market is firm at quotations.

Our market is quoted at 10 to 15 cents, according to thickness.

ALUMINUM.—The market is steady.

We quote in jobbing lots at 50 cents per pound for ingots.

Chemicals.

The general feeling both here and at the East is to more ease. While quotations remain unchanged, yet it is stated that concessions are obtainable on about every line. This is particularly the case at New York when the heavy imports with liberal consignments on its way begin to tell against sellers.

SPELTER.—The market is quiet

We quote our market in a jobbing way at 5 cents a pound.

BISMUTH.—The market is steady.

Our market is quoted in a jobbing way at $1.50 a pound.

PHOSPHORUS.—The market is steady.

We quote in a jobbing way at 70 to 75 cents per pound.

BONEASH.—There is a free outward movement.

Our market is quoted in a jobbing way as follows: Extra, 4c a pound; No. 1, 3¼c; No. 2, 2½c.

SODA ASH, 58% (LeBlanc process).—The market is steady at $1.55 per 100 lbs. in a jobbing way.

CAUSTIC SODA, 60%.—The market is quiet at 3c per pound in a jobbing way.

HYPOSULPHATE OF SODA.—There is a fair demand at 2½c a pound from stores.

NITRATE OF SODA.—Market is quiet.

Our market is quoted from store at 4c for 95%.

ACETIC ACID.—The market is steady at 6 to 12c per pound from store for carboys, according to make.

SULPHURIC ACID.—The demand is fair.

We quote in a jobbing way at 1½c per lb for 66%.

NITRIC ACID.—Our market is reported steady from store at 6½@7c per pound in carboys.

BLUE VITRIOL.—Our market is quiet.

We quote in a jobbing way at 4½c per pound.

Mining Share Market.

SAN FRANCISCO, July 1, 1897.

The market has been fairly active the past week at advancing prices under the lead of Sierra Nevada in the north end and Yellow Jacket in the south end. The belief prevails that the market is in control of one or two brokers, one of whom controls two or more mines and has sufficient money backing to send prices to fair figures if desired. About every year this person, it is said, takes hold of the market when such persons as John W. Mackay, D. O. Mills and Col. Hayward are not in the market. It is also stated that under his manipulation the leader has, at times, been advanced several dollars a share. Knowing this the better informed are slow to short at the commencement of his manipulation, but wait until there are signs of outsiders buying after the leader has made quite a nice little advance, for then it takes more money to handle it and therefore it is a safer proposition for selling short. The upmove in Yellow Jacket and Sierra Nevada is due to the shares having been well concentrated and the work in each mine could be magnified into importance so as to excite the cupidity of outsiders into buying at a good profit to the manipulator. In Sierra Nevada they struck a body of low-grade ore said to be entirely new which has been known to miners for years past, that admits of enlarging on so as to get in buyers who are always afraid of being left on a deal. In Yellow Jacket quiet rumors have been put for some time of an improvement in the mine and that a deal in the shares could be looked for. This is the old story brought to life about every two or three years, but which has proved a success to unload shares at good prices. For years no one on the outside has got any returns from Yellow Jacket and it looks as if it will be some time to come before they get returns in the shape of dividends. The adjournment of the exchanges from this afternoon to July 6 is a longer vacation than usual and helps to make small shorts on the market fill.

Official and semi-official news from the Comstock mines is practically unchanged since our last week's review. There are four centers of attraction, as follows: Sierra Nevada, Yellow Jacket and the work in both Alpha and Con. Imperial or Challenge. The Chollar work on the Brunswick lode has seemingly lost its attraction, as has the work in Con. Virginia on the Comstock lode; but now it is Sierra Nevada and Yellow Jacket. What will come next is as yet an open question. In Utah they are still running the north drift from the main west tunnel. In Sierra Nevada the work is confined largely to the 900-foot level, although work is continued on the Layton Tunnel level. On the first-named level they struck a body of low-grade quartz, and expect to run two more crossdrifts for it after the north lateral drift has been run still farther. It is this "expectation," combined with share manipulation, that has given life to the shares down here. In Union they are still working on the 900-foot level, with no change reported. Mexican shareholders are to be congratulated, for the management has struck something beside assessments, even if it is 75 cents to $1 a ton rock. The work in this mine is on the 5000-foot level, in a southwesterly direction. Work in Ophir is continued on the Central tunnel and 1000-foot levels. In the former $1 ore has been struck. In Con. Virginia they are still exploiting the 1000-foot, 1550-foot and 1650 foot levels. Last week they did not extract any ore. They ran into old timbers in one direction and into about everything except pay ore in other directions. From 385 tons of ore worked at the mill there was a bullion return of $36,000. What the net coin return was we are not advised at this writing There is no change in the joint work of Best & Belcher and Gould & Curry. In Savage they continue to make slow progress in striking ore. The Hale & Norcross litigation makes it hard to get mine news, even if there is any to report. The Grayson-Hayward combination, in control at Virginia City, and the Fox combination, down here, places outside shareholders between the devil and the deep sea. No work in Chollar. In Potosi they are still raising from the 100-foot level. Nothing new has come to hand from Bullion. In Alpha the poor grade ore, ranging from $8 to $18 per ton, which we stated would be struck, has been reported. The high-grade ore, still farther west, will not, so it is said, be found yet awhile. When this is uncovered, then the mine, under proper management, could be made to pay handsome dividends; but it looks as if this time is still in the dim future. The joint work of Con. Imperial, Challenge and Confidence to the west is being pushed slowly ahead in favorable formations. The work in Confidence, Crown Point, Belcher, Seg. Belcher and Overman is in the same directions reported last week, with practically nothing new reported in official letters.

From the Brunswick lode our advices state that the joint work of Best & Belcher, Gould & Curry and Con. Virginia is confined to sinking incline shaft No. 2 and exploiting the 300-foot level. The shaft is down nearly 900 feet. In Occidental they continue to exploit the 550-foot and 650-foot levels. On the latter they ran into low-grade ore. Chollar shaft No. 1 is down over 960 feet. They continue to exploit the 300-foot, 400-foot and 500-foot levels. They extracted and raised nearly 200 tons of ore last week. The assays are not so high. They sent to the Carson mint $10,557 in bullion, of which $4935 was in gold. They are still pushing the south drift on the 600-foot level. They ought to start one or two crossdrifts before this month passes.

The following illustrates the changes of the week:

Under date of June 25th F. H. Pettingell writes from Colorado Springs, Col., on mining stocks: "It is tiresome to read daily announcements of strikes and shipments that never occur. We have in mind one company which makes a practice of announcing a shipment before it is made, making mention of it in the newspaper when it occurs, and calling attention to it when the returns are received. This too frequently has the effect of giving this company credit for three shipments when but one is made, to say nothing of the notoriety it receives from the assays, depth acquired, new drifts started, machinery pur-

THE DEMAND FOR STUMP PULLERS.

Another order for a California Stump Puller has just been received from Honolulu. This makes the second within a year from Hawaii. Three more to Mexico, one to Central America and one to Siberia, indicates the growing favor in which these machines are held.

Send to A. BARNES, Gen'l M'g'r, 82-84 Zoe St., S. F., Cal.

A CONTROLLING INTEREST IN 480 ACRES of channel gravel property, requiring from $2000 to $3000 to put in readiness for production. For further information, address L, care of Mining and Scientific Press.

chased occasionally, etc. The stock in question is no doubt at present selling beneath its intrinsic value, and we attribute this directly to the blatant disposition of its 'press agent,' and at present should a rich strike be encountered and given wide circulation, it is possible no consideration would be given to it unless it was to excite ridicule. We do not claim that these newspaper miners are intentionally dishonest, but they are carried away by their optimistic opinions, which they give vent to on every occasion, particularly in the presence of a representative of the press; but whatever their intentions, they do injury to their own properties and are a detriment to the entire mining business. We are forced to admit we are not at all hopeful as regards outside properties, that is, companies that represent only undeveloped territory on the outskirts of the mineral belt. Investors are not at all attracted toward them, and those who are identified with those companies are not protecting their stocks, and we feel that the future in these presents a gloomy aspect. The investor or speculator to-day desires mining propositions, and not land speculation. But to our local stock market: Anyone endowed with ordinary intelligence cannot overlook the many attractive purchases too evident for one to quickly decide which is possessed of the most merit. There are several dividend payers that pay very handsomely on the quotation, but regardless of this there is no great outside buying interest, and the few local speculators who purchase to-day and sell to-morrow buy only for a slight profit. They will invest just as quickly at a higher quotation or sell as promptly at a lower one as they do at present. Another unfortunate weakness which is very apparent is that in case a stock declines, no matter for what cause or under what circumstances, the unthinking ones, either through indolence or from questionable intent, advise their purchase. This many times emanates from those who are carried away by absurd enthusiasm, principally supported by the glamour of local confidence, partially based on the utterance of some effervescent promoter of the stock. Miners and mine-owners and those connected with mining are ever too susceptible to encouragement, ever sanguine, always elated and generally without good and sufficient cause, but it is farthest from our intent to discourage investors—we merely want to assist in correcting, or fostering a careful buying interest that will display good sound judgment and not be guided by something that cannot be substantiated by facts. The production of Cripple Creek must sooner or later dictate higher prices. It may not come at once, but the present re-adjustment that is now taking place in all legitimate stocks foreshadows an advance and defeats the possibilities of any great decline."

Assaying Gold
AND
Silver Ores.
A Standard Work.
THIRD EDITION JUST OUT.
By C. H. AARON.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the pratical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores,") that have been "successfully popular," is written in a condensed form, which renders his information more readily available than that of more wordy writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents—Preface: Introduction: Implements; Assay Balance; Materials; The Assay Office: Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assay; Examples of cupellation; Weighing of Beads; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests of Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 126 12 mo pages, with illustrations, well bound in cloth; 1896. Price **$1.00** postpaid. Sold by the **Mining and Scientific Press**, 330 Market St., San Francisco.

AN INTEREST IN 100 ACRES CHANNEL gravel property for running tunnel probably 300 and not to exceed 500 feet. Address L, care of Mining and Scientific Press.

Assessment Notices.

THORPE MINING COMPANY. Location of principal place of business, San Francisco, California. location of works, Fourth Crossing, Calaveras County, California.

Notice is hereby given that at a meeting of the Board of Directors held on the 9th day of June, 1897, an assessment (No. 5) of 2½ cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, room 44, Phelan building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 17th day of July, 1897, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY the 9th day of August, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

A. F. FREY, Secretary.

Office—Room 44, Phelan building, San Francisco, California.

ROSE CREEK MINING COMPANY. Location of principal place of business, San Francisco, California; location of works, Star, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 28th day of June, 1897, an assessment (No. 1) of 1c cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room 63, Crocker building, junction Post Montgomery and Market streets, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 28th day of July, 1897, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 30th day of August, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. M. WILMANS, Secretary.

Office—Room 63, Crocker building, San Francisco, California.

OSCEOLA CONSOLIDATED MINING COMPANY. Location of principal place of business, San Francisco, California; location of works, Amador County, California.

Notice is hereby given that at a meeting of the Board of Directors held on the 30th day of June, 1897, an assessment (No. 6) of 1 cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, 307 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 2nd day of August, 1897, will be delinquent, and advertised for sale at public auction, and, unless payment is made before, will be sold on SATURDAY, the 21st day of August, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

HOLLAND SMITH, Secretary.

Office 307 Montgomery street, San Francisco, California.

GOLD IN COLORADO!

Colorado has within its limits some of the greatest gold mines that has ever been discovered. In Cripple Creek in 1892 there were a few prospectors looking over the hills; in 1895 the camp turned out over $8,000,000 in gold. Leadville, the old bonanza camp and the mineral product of which made Denver what it is to-day, is becoming a big producer of gold. New inventions for working low-grade gold ores, together with the discoveries made to work rebellious ores, have opened up a field for the miners such as they have never enjoyed before, and Colorado has inducements to offer such as no other district in the world possesses; the record of the State in gold production for the last three years speaks for itself. Among the other prominent camps in the State are Telluride, Ophir, Rico, Silverton, Mineral Point, Durango, La Plata, Ouray, Saw Pit, Ironton, the Gunnison district and many others. New finds are being made and new camps are springing into existence every day. The Denver & Rio Grande Railroad, which is the pioneer road of Colorado and which has always been the miner's friend, reaches all the mining camps in Colorado. In the Superior Court of the City and County of San Francisco, State of California, Department No 8. John V. Kimball, plaintiff, vs. Mabel L. Kimball, defendant. Action brought in the Superior Court, City and County of San Francisco, State of California, and the complaint filed in said City and County of San Francisco, in the office of the clerk of said Superior Court. The people of the State of California send greeting to Mabel L. Kimball, defendant. You are hereby required to appear in an action brought against you by the above-named plaintiff in the Superior Court, City and County of San Francisco, State of California, and to answer the complaint filed therein within ten days (exclusive of the day of service) after the service on you of this summons, if served within this county; or, if served elsewhere, within thirty days. The said action is brought to dissolve the bands of matrimony now existing between yourself and plaintiff, on the ground of habitual intemperance on your part for more than one year past. All of which will more fully appear in the complaint on file herein to which you are hereby referred. And you are hereby notified that if you fail to appear and answer the said complaint, as above required, the said plaintiff will apply to the said Court for the relief prayed for in the complaint. Given under my hand and seal of said Superior Court at the City and County of San Francisco, State of California, this 9th day of April, in the year of our Lord, one thousand eight hundred and ninety-seven. C. F. Curry, Clerk. By Joseph Riordan, Deputy Clerk. R. Thompson, Attorney for Plaintiff.

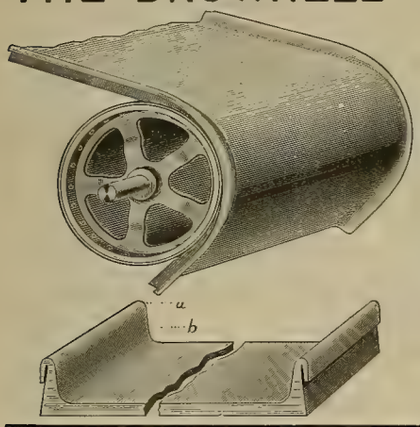
THE BROWNELL "PATENT LIP" FLANGE FRUE VANNER BELTS.



It has taken years of ceaseless testing and experimenting to produce the superior belt which we now offer, with elastic flanges and pliable body reinforced with specially woven duck. Every belt is manufactured by experienced workmen, and carefully tested on machines especially built for that purpose; consequently we are to-day manufacturing the best belts that mechanical ingenuity, combined with honesty of construction, can possibly produce.

RAWHIDE GOLD MINING COMPANY,
JAMESTOWN, TUOLUMNE CO., CAL., Feb. 21, 1897.

J. S. BROWNELL, ESQ.—DEAR SIR: Replying to your query of Feb. 15th, will say that I have used your Patent Lip flange belt more than one year, and judging from their appearance after more than one year of hard service, I do not hesitate to say that they are the best belt I have ever used and I take great pleasure in testifying to the fact. Yours truly, W. A. NEVILLS, President.

AMADOR CITY, CAL., Feb. 18, 1897.

MR. J. S. BROWNELL—DEAR SIR: I take pleasure in saying that I have used your Patent Lipped flange belt for several years while connected with this company, and I consider them the best that we have used. The quality of rubber in the flange seems to be the best, and we are not bothered with the flange cracking and thereby destroying the life of the belt. At present we are using 14 concentrators, and have in use several kinds of belts. We consider your Patent Lipped flange the best. Yours very truly, THE CONS. SOUTH SPRING HILL G. M. CO.
By JOHN R. TREGLOAN, Superintendent.

AND PACIFIC ELECTRICAL REVIEW.

No. 1931.—VOLUME LXXV. Number 2. SAN FRANCISCO, SATURDAY, JULY 10, 1897. THREE DOLLARS PER ANNUM Single Copies, Ten Cents.

The Debris Commission.

A conference was held between committees from the California Miners' Association and the Anti-Debris Association of the Sacramento Valley last week in San Francisco. The committees had been appointed by their respective associations for the purpose of endeavoring to formulate some plan upon which they could co-operate with reference to the protection and improvement of the rivers in such a way that the mining interests may be fostered and the streams cleared and improved at the same time.

As the welfare of the two interests are so bound up with each other it has been the main object of the Miners' Association to secure unity of action. The plan is to endeavor to secure, at the next session of Congress, large appropriations for restraining dams and other work, to the end that hydraulic mining may be further resumed, and, at the same time, larger appropriations for the improvement of the Sacramento and San Joaquin rivers. It is generally conceded that there will be no likelihood of securing much recognition without concert of action between the two associations.

The Miners' Association was represented by President J. H. Neff, Secretary Julian Sonntag, Tirey L. Ford and Edward Coleman of San Francisco, and James O'Brien of Yuba county. The Anti-Debris Association was represented by Manager W. A. Phipps of Marysville, Attorney Robert T. Devlin and William Johnson of Sacramento, and Dr. Durst of Yuba.

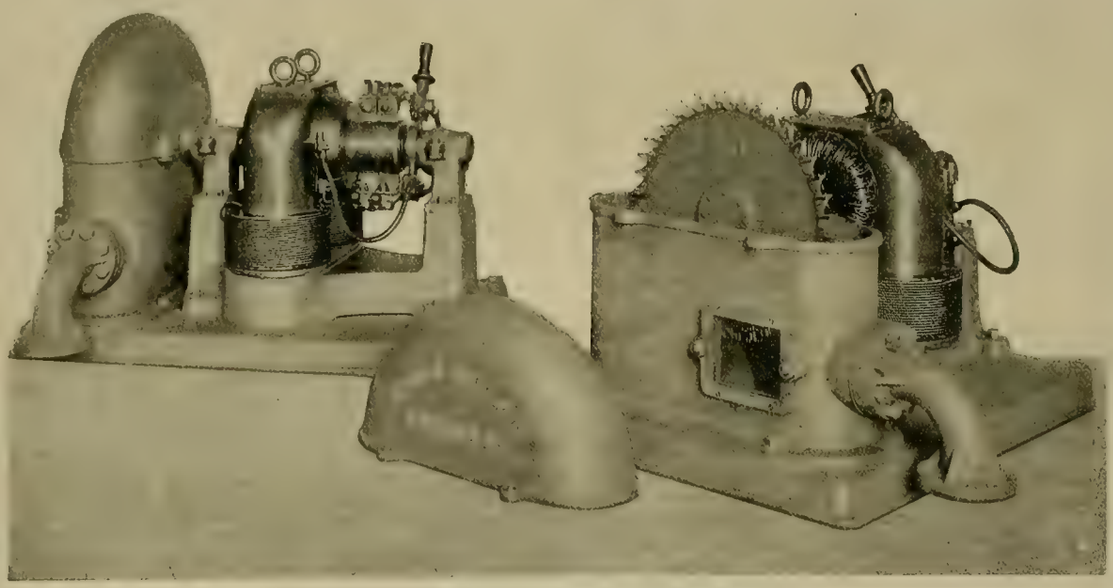
The conference developed evidence of most cordial good feeling on both sides. The whole subject of the relations of the miners and the valley people were gone over in a general way. No definite plans were formulated, but another conference was arranged for July 30.

Amending the Tunnel Law.

Bell of Colorado has introduced in Congress a bill amending the Tunnel Site Act to provide that if the tunnel owner wants to claim and hold a tract 1500 feet wide by 3000 feet on the tunnel line, he must keep two shifts of miners at work all the time. Failing to do this he can only hold the width of the tunnel for prospecting purposes, depending upon the discovery of lodes not discovered on the surface for his labor. The recent decision of the United States Supreme Court says in effect that so long as a tunnel owner works with reasonable diligence he can reserve the larger tract for prospecting. As the law at present does not define what reasonable diligence means, the amendment is timely.

Mine and Mill Lighting.

The accompanying cut illustrates a recent development in the application of electricity for the illumination of mines and quartz mills. It consists of a Crocker-Wheeler dynamo coupled direct to a water wheel, operating under a head of 1000 feet and developes a capacity of 7½ K. W.—150 16 candle power. The novelty of this combination lies in its entire independence in operation of any other machinery which may be driven from the same source, thereby assuring reliable and uniform light at all times, doing away with belting and countershafting and delivering power to the dynamo without intermediate connections. These combinations are made in different sizes to meet any requirements by the Abner Doble Company of this city.



DIRECT CONNECTED WATER WHEEL AND DYNAMO.

Survey Monuments.

The United States Geological Survey is definitely locating the boundary line between Idaho and Montana. All important points will be marked by large stone monuments and the rest of the line by iron monuments intervisible. For about a year the United States Geological Survey has been placing iron monuments at township corners in their surveys, particularly in Colorado and Wyoming. It is to be hoped that—the days of Benson and other frauds having passed away—all surveys made be marked so that they can be made use of by local surveyors. The Kootenay Mine Owners' Association proposes that the Canadian Government be urged to erect monuments in the mining districts to which surveyors may tie their surveys. If something of this kind were done in California and other States in the mining districts much trouble, expense, confusion of titles and unnecessary litigation would be saved.

It was proposed that the last Legislature enact a law providing that locators of mining claims may have their locations tied up to township or section corners by United States Deputy Mineral Surveyors, and that the notes of these surveys be recorded as the best evidence of the boundaries of the claims. Had the mine owners of this State been made to appreciate the value of such surveys, no doubt there would have been a strong demand for the passage of the bill. But the want of monuments and the heavy cost of surveys have prevented many miners from appreciating the advantage of a different state of affairs.

An Important Case.

In the United States District Court at Boise, Idaho, Judge Beatty has decided in favor of the plaintiffs, the owners of the Kirby mine, the case of Rutler et al. vs. the Shoshone Mining Company. Following the ledge on its dip and working through the Last Chance tunnel, parties connected with the Last Chance opened up a body of ore. They located a point in the surface immediately over the discovery marked it "Shoshone discovery" and laid out the Shoshone claim. The location was in conflict with the Kirby location, and when the Shoshone company applied for a patent this adverse case was started. The contest was really between the Last Chance and the Bunker Hill and Sullivan. The dip of the vein in the Last Chance carries it outside the Last Chance side lines, and into the disputed ground. This disputed ground the Last Chance sought to hold under a mining claim known as the Shoshone. The Bunker Hill and Sullivan claimed the ground through two claims covering substantially the same area. The Shoshone company, owned by the Bunker Hill and Sullivan, adversed the application. The case will probably be carried to the United States Supreme Court.

ANNUAL assessment work on an unpatented mining claim is not so much to keep a title alive as to prevent it from lapsing. That is, suppose one locates a claim and does no work on it for five or six years. His claim is jumpable, but, if let alone, at the end of the five or six years he can get a patent by making $500 worth of improvements. At any time during the period since location he took chances on its being relocated. His title was all right so long as no one thought the claim worth jumping. But to guard against that it is necessary to put $100 worth of work annually on the claim.

THE Colorado Mine Inspector, Lee, after spending two weeks looking over the ground, notified the owners of 120 shafts in Cripple Creek that certain repairs were necessary for the safety of the men, and the owners have made them.

THREE ten-horse teams are engaged hauling borax from southwestern Oregon to Winnemucca, Nevada, where it is shipped.

TABLE OF CONTENTS.

ILLUSTRATION.—Direct Connected Water Wheel and Dynamo, 25.
EDITORIAL.—The Debris Commission; Amending the Tunnel Law; Mine and Mill Lighting; Survey Monuments; An Important Case; Annual Assessment Work on Unpatented Claims; Unsafe Shafts in Cripple Creek; Hauling Borax, 25. The Rights of Tunnel Owners; County Mining Exhibits; The Object of Assessment Work; The International Gold Convention, 26.
MINING SUMMARY.—From the Various Counties, of California Nevada and Other Pacific Coast States and Territories, 30-31.
SCIENTIFIC PROGRESS.—Advance of Scientific Knowledge; A New "Gold Process;" Color That Fish Assume When Asleep; Concerning the Polar Basin; Average Depth of Soil; Living in Compressed Air; Returned to Sydney, 32.
ELECTRICAL PROGRESS.—Tesla's Wireless Telegrams; Copper and the Third Rail; Electro-Capillary Light; Effect of Temperature upon Magnetic Properties of Iron; "Signaling Through Space Without Wires," 32. Not "Electrical Progress;" Electrolytic Refining of Copper; Preserving Meats; Lighting Railway Cars by Electricity; Electricity Passed Through Him; Electrolysis; Electric Motive Power, 33.
MECHANICAL PROGRESS.—A Test of Oils; Nickel Steel Tests; Ancient Arizona Engineering; A New Pyrometer; Riveting with Compressed Air; Sound as a Measurer; The Wheelbarrow; A New Safety Igniter; Another New Bridge; Rapid Loading, 33.
THE MARKETS.—Eastern and Local Markets; Mining Share Market; Sales in San Francisco Stock Board; Notices of Assessments, etc., 42-43.
MISCELLANEOUS.—Concentrates, 27. The Situation in the Comstock Deep Levels, 28. Condition of Gold Mining in California; Assaying of Gold and Silver, 29. Coast Industrial Notes; Recent California Mining Incorporations; Recently Declared Mining Dividends; Personal; Book Notices; Commercial Paragraphs, 35. List of U. S. Patents for Pacific Coast Inventors; Notices of Recent Patents, 38. Obituary, 43.

The Rights of Tunnel Owners.

The syllabus of the opinion of the United States Supreme Court in the case of the Enterprise Mining Company vs. Rico-Aspen Consolidated Mining Company, et al has been received. It gives a very clear idea of the rights of tunnel owners as laid down by the Court, and is as follows:

1. The right of the owner of a tunnel to all veins or lodes not previously known to exist, which are within 3000 feet from its face on the line thereof, is superior to the right of one who subsequently makes a discovery and location of another claim, if the two conflict.

2. The right to a vein discovered in a tunnel dates by relation back to the time of the location of the tunnel site.

3. The location of a claim to a vein discovered in a tunnel may be made on its discovery by taking the full length of 1500 feet allowed by U. S. Rev. Stat. Sec. 2320, on either side of the tunnel, or any such proportion thereof on either side as the locator may desire, and is not limited to 750 feet on each side of the tunnel on account of a failure to indicate, when the tunnel was located, what particular 1500 feet he would claim.

4. The Colorado territorial act of 1861 limiting the right of a tunnel owner to veins discovered in the tunnel, to 250 feet on each side, is, if not repealed by the Colorado legislature, superseded by the legislation of Congress in the Revised Statutes.

5. The failure of a tunnel owner to "adverse" the application for a patent for a claim located parallel to his tunnel and about 500 feet distant from it, when he does not know of any vein which will enable him to dispute the right of the other party to a patent, will not defeat his right to a vein subsequently discovered which crosses that claim.

County Mining Exhibits.

A number of the counties of the State in which agriculture is the principal industry maintain permanent exhibits of the products and bureaus of information that are of particular value to investors. The MINING AND SCIENTIFIC PRESS has suggested before this that something in this direction might well be done in the leading mining counties. The object of any permanent exhibit should be mainly to give information to those seeking it as to the different districts and mines in them and their resources, and, secondarily, to attract capital. Every day people call at the office of the MINING AND SCIENTIFIC PRESS to ask to see maps or look up data as to mines or districts in different counties of the State. Such is the experience, also, at the State Mining Bureau. These are men who know definitely what they want, and very often they complain that it is next to impossible to find such data as they require in the neighborhood of the mines they are to visit, except from personal investigation.

It would seem an excellent move on the part of the Miners' Association of a number of the leading counties of the State to induce co-operation of the county authorities in establishing, at the county seats, exhibits of ores from the different mines and districts, maps, reports and other data, that would be of value to experts, prospectors, mine owners and investors.

The failure to sell many a mine is due not to the want of merit, but to a lack of definite information furnished in regard to it. The material advantage of such exhibits of bureaus as are suggested cannot be overestimated. The cost need be but trifling. The Board of Supervisors of the different counties could, at very little expense, provide for the housing of them. An exhibit of minerals could be obtained from the mine owners themselves, and maps and reports and other data would nearly all be contributed.

The Object of Assessment Work.

There is an interesting case on trial in Colorado that brings into dispute again the question as to whether a location is valid or not before a vein or mineral in place is discovered. In this case both claimants set discovery stakes on the ground in dispute, which was in the Cripple Creek district, in 1892, and dug discovery shafts, as required under the State law. It is the contention of the plaintiff that neither of the locators found a vein in the discovery shafts and that, therefore, neither had a valid location. Leaving the discovery shaft after he had completed the record, the plaintiff sunk another shaft, in which a vein was found, and he claims that it was found before the defendant discovered a vein. It was admitted that the defendant's location was prior to that of the plaintiff.

The contention of the plaintiff is that no location is valid until a vein or mineral in place is discovered, and that such discovery need not be made in the discovery shaft, but will make the location valid if discovered anywhere on the claim, and that he, having first found a vein, has a valid location to the ground in dispute, notwithstanding the defendant's location certificate and discovery stake bears the earlier date.

In the Maid of Erin case, of property in dispute at Leadville, this question was brought up. The Maid of Erin discovery shaft was not sunk on the vein, but later some distance away a deposit of ore was discovered after sinking a shaft to a depth of 125 feet. Senator Teller of Colorado, who was then Secretary of the Interior, held that the Maid of Erin location was good, even though the mineral was not found in the discovery shaft. He held that the United States law does not require that a discovery of a vein must be made in the discovery shaft, although the Colorado statute does, and that the Colorado statute in this respect is void, because it is in conflict with the Federal statute.

In Colorado the statute requires that a 10-foot shaft or tunnel must be dug at the point of discovery to show by such work a lode or deposit of mineral in place to complete the location. In California the new law requires that $50 worth of work must be done within sixty days of discovery to complete the location. This is without reference to the vein or lode itself. In Nevada the law is similar to that in Colorado. The sole object of the framers of the California law was to compel development and prevent people from holding claims without work. As to the Colorado law there is confusion as to what was its purpose in requiring this work, whether simply to compel development or to prove the presence of a lode or mineral in place. The object of the Federal statute as to the assessment work is only a condition of continued ownership. In a Colorado case, referred to last week in this paper, Judge Field said: "Discovery and appropriation are the sources of title to mining claims, and development, by working, as a condition of continued ownership until a patent is obtained." As the source of title is from Federal ownership, it is possible that the United States courts will hold that the Colorado requirement of extra work can only be permitted on the ground that it is a *condition of continued ownership.* In this case the question of sinking on the vein or elsewhere would cut no figure. Now that nearly every State and Territory in which gold and silver mining is being conducted have adopted some such provisions as are in the California or Colorado laws, it might be well for Congress to take up and pass a general law as an amendment to the present statutes.

The International Gold Convention.

The first International Gold Convention was called to order in Denver, Colorado, last Wednesday, with nearly 800 delegates, representing about twenty States and British Columbia, Mexico and Venezuela. R. F. Hunter, chairman of the Executive Committee, called the convention to order. After prayer by Rev. M. A. Ellis, reading of the call by Secretary Irving Mahon and an address of welcome from Acting Mayor O. B. Scobey, the Governor of Colorado, who was chosen temporary chairman, delivered an able address, explanatory of the purposes of the convention. He said in part:

To increase the gold mining industry is the purpose of this convention. While local selfishness may have inspired the call, the importance of gold production reaches beyond the interest of the miner who mines it, or the State in which it is found, and becomes a question as wide as human commerce and civilization. "More gold" is the purpose of this assembly, and it is the only platform ever presented to a congress of delegates that did not meet opposing votes.

Gold is the only deity before which universal man has ever bowed. Religion has never reared an altar that has not been shaken by the clerk of heresy. Political wisdom has never devised a code or constitution that did not invite revolt. No moral system has ever won general approval. Only behind the banner of gold does there trail the hungry, enthusiastic, untrained hosts of the human race. It matters not what land bore them, what faith guides them, what altar hears their prayers, what color God tinted their skins; every heart pulsates with the same love of gold; no chasm of creed or race that will not be bridged by lives and swords in its pursuit. This convention represents States that produce one-fourth of the gold of the world and can, with encouragement of capital, double that production.

The depressed condition of commerce and industry, the unnumbered idle hands, should turn the attention of every patriot to the mines. All history teaches that nothing relieves business depression, loosens the bonds of industry and labor as quickly as an increased supply of the coinage metals of the world.

If California would equal her gold product of 1857, if some of the idle money and labor that now burden the banks and labor marts could be utilized to develop the mines of Colorado and other mountain States, there would come to our nation an industrial change and emancipation recalling the emergence of Europe out of the deep shadow of the middle ages under the influence of the gold which Spanish conquest sent eastward across the sea.

Since 1892 gold, silver and copper mines are about the only industry that has paid dividends. If this convention can turn the attention of capital from unproductive investments to legitimate mining it will have advantaged country and investor alike. Business care and sense in mining will pay better than most lines of investment.

Prospecting as a road to individual fortune may be an illusion; the pathfinder seldom enjoys his own discovery, as even good mines require large expenditure, but legitimate mining, as a vocation, is a profitable business. Many people act and invest as though mining was exempt from the requirements of prudence and judgment, which other investments demand.

A committee on credentials reported recommending B. Prince of New Mexico for permanent president; David T. Littler of Illinois, John Dern of Utah, and General Alexander Barara as vice-presidents-at-large, and that each State selected a vice-president and member of the executive committee from its delegation. Irving Mahon of Colorado was named for permanent secretary and O. W. Crawford of Illinois as assistant. It was also recommended that all discussions be confined to mines, mining and kindred subjects, and that every State, Territory or foreign nation be allowed ten votes, providing it had that many delegates present; if not, then one vote for each delegate.

Resolutions were adopted under suspension of the rules, one calling upon Congress to place cyanide of potassium on the free list and another authorizing the president to appoint a committee of five to investigate and report on the advisability of asking Congress to create a department of mines and mining, the head of which should be a member of the President's cabinet.

Concentrates.

THE Portland, Oregon, Mining Exchange has been incorporated.

THE Dexter mine at Tuscarora, Nev., has 125 men on its payroll

OVER 3000 prospectors are reported now at work in northern New Mexico.

A CINNABAR LEDGE is being developed in New River, in Trinity county, Cal.

RUBBER is vulcanized by heat. Benzine is not used in that way, but to dissolve it.

PIOCHE, Nev., has only one saloon, but it manages to support a respectable newspaper.

AT the Le Roi mine, at Rossland, B. C., a new engine, capable of running forty drills, is being put in.

THE product of tin plate in the United States has increased from 14,000,000 lbs in 1892 to 307,000,000 in 1896.

THE Topeka group of mines in Russell gulch, Gilpin county, Colo., has been sold to a New York syndicate for $160,000.

A MINING dredger is being built at San Antonio to dredge the auriferous sands of the Yaqui river in Mexico.

ARRANGEMENTS have been made to resume work on the Siskiyou copper mines, near the line between Oregon and California.

THERE are five carloads of machinery on the road for the Big Bug onyx mines in Arizona, which are to be worked on a large scale.

THE main tunnel of the Red Point drift gravel mine, near Damascus, Placer county, Cal., is now in over two miles on the channel.

THE net earnings of the large mining companies at Butte, Montana, as returned to the assessor for 1896, amounted to $7,799,077.66.

THE Bonanza mine at Baker City has been under examination for a New York syndicate, who are reported to have purchased it for $750,000.

THE Fortuna mine, in Arizona, is being worked to a depth of 400 feet where the ledge is 30 feet wide. The mill crushes eighty tons of ore daily.

THE Gold Creek Mining Company at Gold Creek, Nev., has made application at the United States Land Office for twenty-nine patents on placer mines.

DURING the past six months nearly sixty companies have been formed in London for mining, exploration and smelting purposes in British Columbia.

COPPER is the only product whose price has advanced in recent years. Gold and copper are the only products whose prices have not recently fallen.

A NEW 30-stamp mill at the Austin mine at Austin, Nevada, has been started up. With power supplied by the company the town is lighted by electricity.

THE suspension of the requirement for $100 worth of annual work or improvement on an unpatented mining claim applied only to the calendar years '93 and '94.

To date E. C. Brice, the "gold maker," has been unable to satisfactorily show the United States Government authorities that he can make gold and silver at will.

MACHINERY, tools, etc., on an abandoned mine are not "locatable." Failure to comply with any Government requirement affects only title to the mine itself.

P. A. BUELL of Stockton states that money has been promised for the projected smelter at that place, and that Eastern men who are to furnish it will arrive in a few days.

THE first stamp mill in California was built in Mariposa county in 1850, the second in Nevada county, on Wolf creek, nearly opposite the present Empire mill, in January, 1851.

THE Colonial Parliament of West Australia has sanctioned the building of water works which will cost $12,000,000 to supply the Coolgardie gold mines with 5,000,000 gallons daily.

IN the Thistle Shaft drift mine, in Plumas county, Cal., the water which came in last fall prevents working, and it will be two months before the large pumps have the water under control.

THE statement of the Isabella Company at Cripple Creek, Colo., for the quarter ending June 1st shows that the profits for March were $8284.81, April $2111.15, and May a deficit of $505.90.

A "FLOATING DEBT" is, practically, an unsecured debt. The unsecured liabilities of any corporation, mining or otherwise, the current unpaid accounts, etc., constitute a "floating debt."

THE only firms in the State handling antimony, so far as we know, are the Selby Smelting Works, 416 Montgomery street, and the Pacific Sheet Metal Works, 209-211 Mission street, San Francisco.

A TRAMWAY cable weighing 17,000 pounds was carried to the Nellie mine at Telluride, Colo., last week, on the backs of sixty-four mules. The mules were about 10 feet apart, each carrying a small roll.

THE Canyon City & Cripple Creek Gold Belt Railway Company will begin grading July 10, and its completion will increase the transportation and milling facilities of the Cripple Creek mines considerably.

AN indication of the results of the "revival of mining" in Arizona is seen in the fact that the Federal Government has increased the salaries of the postmasters at Bisbee, Globe, Nogales, Tucson and Yuma.

IN the Hahn's Peak district, in Colorado, a comparatively new camp, single individuals have located as many as half a dozen tunnel sites each, and a miners' meeting has been called to take steps to stop the evil.

LAST week the night shift—150 men—on the Iron Mountain mine, Shasta county, Cal., struck when asked to work ten hours instead of nine. The old schedule was ordered left unchanged and the men returned to work.

TWO-THIRDS of the gold produced in California in 1896 came from the following eight counties: Nevada, Placer, Calaveras, Amador, Trinity, Siskiyou, Tuolumne and El Dorado. Nearly half the yield was produced in the first five.

THE biggest piece of gold free of quartz ever found was taken from the Byer & Haltman claim, Hill End, N. S. W., May 10, 1872, weighing 640 pounds and worth $148,000. It was imbedded in blue slate 250 feet from the surface.

ONE Boggs of Pittsburg, Pa., for the purpose of selling a mine at Mercur, Utah, of which very little is known there, is making some remarkable stories regarding the gold fields of Mercur. He says the gold vein is fifteen by fifteen miles in extent and from five to ninety feet in thickness. In speaking of the ore in sight at the various mines, he says the East Golden Gate has $15,000,000 of gold blocked out.

OVER $42,000 has been expended since March 1 on assessment work in the Nelson district in British Columbia. In a few cases cash as allowed under the law has been paid into the mining recorder's office in lieu of assessment work.

ACCORDING to an Australian mining paper the London superintendent of a Kalgoorlie mine recently gave a working miner £25 to explain to him what a winze was so that he might be prepared for questions at a forthcoming meeting.

THE Boston and Fantasma Mining and Milling Company has been incorporated under the laws of the State of New York, and has taken over the Boston, Fantasma and Alert gold mines in the Silver Mountain district, San Bernardino county, Cal.

THE bill for the Crow's Nest Pass Railroad, to be built by the Canadian Pacific, has passed finally, and already active work has begun. It will be completed next year, probably, and will do much for the mines of the Kootenay country in British Columbia.

ANOTHER strike has been made in the Mollie Gibson mine at Aspen, Colo., and the shares have gone from 20 cents to 70 each. Prior to two years ago, when dividends stopped, there had been divided from this mine among shareholders $4,080,000.

W. A. CLARK, who is now in Europe, is negotiating for the sale of the United Verde copper mine at Jerome, Arizona, to a French syndicate. The output is about 2,000,000 pounds monthly of copper, which it is expected will shortly be increased to 12,000,000 pounds monthly.

THE payroll of the Comstock mines last month amounted to a trifle over $50,000, less than the payrolls of the mines of several counties in California. The Consolidated California and Virginia paid out $10,485, the Brunswick Exploration Company $6916 and the Choller $8105. No other mine paid out over $2500.

A NEW LAW of British Columbia requires all incorporated companies to take out a license costing $100, and at Grand Forks and other places, acting on the supposition that a number of stock companies had neglected to renew their free miner's licenses, a number of the best known claims were jumped at midnight June 30.

CARDWELL and his associates have built the wagon road from Cisco to within three miles of the mines in Meadow Lake district, Nevada county, Cal., and a daily stage has been put on. It is proposed to continue the road to Sierra City. A town has been laid out at Carlyle and a store and hotel are being built.

THE Rio Tinto, Tharsis, Aguas Tenidas and others in southern Spain, together with San Domingo, on the borders of Portugal, at present yield from 50,000 to 55,000 tons of copper annually, being about one-sixth of the world's output, besides 1,250,000 tons pyrites, for export, covering nine-tenths of the consumption of Europe.

THERE is a dispute going on between the mine owners and mill owners of Cripple Creek over the prices charged for milling low grade ores. There are at Cripple Creek immense bodies of low grade ore in the mines, running from $5 to $10 a ton, which cannot be handled at the prices charged. Some day it will all be worked.

AN attempt made to reduce the wages of white miners on the Rand, South Africa, resulted in a riot, in which seven men were killed, and the mine owners have abandoned the scheme of reducing wages. The rates were about $5 a day and a reduction of about 10 per cent was proposed. The miners have since formed a union.

WE are not acquainted with the name of any firm manufacturing for sale an automatic tailing sampler. On page 432 of the issue of May 22d, '97, was illustrated and described a device of that kind in successful use at the Idlewild or Taylor mine, Greenwood, El Dorado county, Cal. There is probably demand enough for the manufacture of such a machine.

CAPTAIN J. B. DE LAMAR has decided to go ahead with the building of a mill for the Golden Gate mine at Mercur, Utah. The plans, which are out, call for a daily capacity of 800 tons, although at first the mill will start with only 500 tons capacity. A great deal of development work has been done at the Golden Gate mine, and large bodies of ore are blocked out.

AT the San Francisco Stock and Bond Exchange for the first six months of 1897 the sales of stocks amounted to 129,206 shares, against 114,793 shares for the first six months of 1896, and 36,254 shares for the same period in 1895. The sales of bonds for the first six months of 1897 amounted to $1,728,000, against $1,254,900 for the same time in 1896, and $865,000 in 1895.

THE discovery of gold on Oak Point island, in Rainy lake, has raised the question of the international boundary line between Minnesota and Ontario. Canada claims the island and is issuing patents to many locations on it. American miners are protesting that, although the survey shows the island to be in Canadian territory, it in reality belongs to the United States.

UP to July 3 the value of exports of ores and product of the smelters for the Kootenay mines of British Columbia for 1897 is returned at $3,736,533.92. The ore shipments from seven mines via Nakusp amounted to 1247¾ tons for the week ending July 2, valued at $94.522 per ton. During the same week 448 tons of ore valued at $80.479 per ton were shipped via Kaslo.

CONGRESSMAN DE VRIES has introduced a bill to locate a wagon road between Mono lake and Yosemite valley. It provides for the appointment of three Commissioners, one to be an army officer, one a resident of either Mariposa or Tuolumne county and one a resident of Mono county, to locate the road. Aside from giving the people east of the summit of the Sierras a means of reaching the valley such a road would be of value to mining.

REGARDING the inexact use of the nautical term "knot," it may be stated there is no such distance as a "knot." A "mile" or a "league" is a regularly defined distance; a "knot" correctly refers only to the rate of speed at which a vessel moves in the water. While the distance between two "knots" on the logline is 6082 feet, that cannot be considered as a measure of distance. A mile is a mile, by itself; a "knot" is always in connection with time.

THE MINING AND SCIENTIFIC PRESS takes this method of returning sincere thanks for the hundreds of hearty notices and commendations it has received in the last three weeks. To reproduce one-half of the kindly printed and written paragraphs would take many extra pages. Our contemporaries and exchanges everywhere have been particularly kind in referring to our new building, and their cordial announcements are gratefully and thankfully appreciated. Such evidence of good will on all sides toward this paper is highly valued, and we shall try to deserve its continuance.

ON this page of "Concentrates" is weekly answered a multitude of inquiries from correspondents everywhere, whose questions are often of sufficient general interest to warrant such publicity, as it often happens that a good many have the same question in their minds. This explains why so often a brief statement is made on some general point. It is a "concentrate," a condensed answer to some practical inquiry. Such published announcement is usually the result of considerable inquiry on the part of the paper and put in such a shape that a busy man can catch the idea at a glance.

A GOOD way to free copper plates from gold is to put them over a charcoal fire and slowly evaporate the quicksilver. The plates should be cooled gradually, then rubbed with muriatic acid, put in a damp place over night, then rubbed with a solution of sal ammoniac and saltpeter, and slowly heated over a thin red fire, but not allowed to get redhot. When the gold scale blisters the plates should be taken from the fire and the gold scraped off. Where the gold has not blistered should be retreated with the solution and again fired. Collect the gold scales in an earthen dish, cover with nitric acid till all the copper is dissolved, when the gold can be smelted; after melting, corrosive sublimate should be used in the crucible till a blue flame ceases to burn.

TOPOGRAPHIC sheets of the United States Geological Survey may be obtained by addressing the Director at Washington, D. C., and enclosing the price, 5 cents each, which is about the cost of printing. The following sheets of California are in print: Alturas, Banner Hill, Bidwell Bar, Big Trees, Camp Mojave, Chico, Colfax, Downieville, El Cajon, Escondido, Genesee, Grass Valley, Honey Lake, Indian Valley, Jackson, Lassen Peak, Lodi, Markleeville, Marysville, Modoc Lava Bed, Nevada City, Oceanside, Placerville, Pyramid Peak, Red Bluff, Redlands, Sacramento, Shasta, Sierraville, Smartsville, Sonora, Taylorsville, Truckee, Wellington, several sheets from Los Angeles to San Bernardino, and the San Luis Obispo sheet. Yosemite is in press.

THE Canadian Parliament having empowered the Government to impose an export duty on silver-lead ores has led to a belief that this duty would be imposed immediately. The *Kootenaian* says on this subject: "What the Government has done is simply to give itself power to impose such a duty, and a man does not have to be a prophet to see that the power will only be enforced in case of any attempt on the part of the owners of Canadian mines to build smelters in the States. What the Government is desirous of doing is to encourage the building of smelters in Canada. When the Crow's Nest railway is completed the country, thanks to the Government, will be assured of a cheap and abundant supply of coal, and there will then be no reason to ship an ounce of ore out of the country for treatment."

THE State Mining Engineer of the South African Republic, in his report for 1896, shows that during the year 200 gold mining companies had been at work, against 170 in 1895. The nominal capital is £57,360,225 and the working capital £21,177,317. In 1895 dividends paid were £2,595,210 and in 1896 only £1,793,781. The capital invested in mining machinery was £5,322,494. The horse power used in the mines was 138,088. Of the total output 68 per cent came from the mill and 32 per cent by chemical treatment. The average yield per ton was 40 shillings, a decrease of 4 shillings. The number of workmen employed was 9375 whites and 64,012 natives. The average pay of white workmen was £302 per annum and of natives £48 per annum. During the year 541,152 feet were driven on the mines and 190,070 feet sunk, or nearly 140 miles altogether.

THE Le Roi mine at Rossland, B. C., is owned mostly by American citizens living at Spokane, Wash. It is proposed to erect a smelter. On account of supplies, flux, coke, proposed export duty of Canada and railroad transportation, they are having considerable difficulty in fixing on a location. One British Columbia mine owner, living in Spokane, said the other day: "This Le Roi incident is one of those things that is likely to become national in its importance before it is ended. It would not surprise me in the least to see the Le Roi smelter built at Northport, and then, if this attempt is made to coerce them by placing a duty on the exports from the province, to see the Le Roi mine closed down until the matter is settled. In such a case, Rossland and the entire camp would be the sufferers, for the Le Roi people can better afford to hold their property in *statu quo* than can Rossland afford to lose the Le Roi pay-roll."

THE Golden Cross mines at Hedges, San Diego county, are again in the hands of a receiver. Two years ago owing to large liabilities the mines were placed in the hands of W. W. Stewart as receiver. Having placed them on a good paying basis and paid off a large part of the indebtedness he was discharged about a month ago and the property turned over to J. Spiers, J. Sloss and others holding a deed of trust. Last week the Golden Cross Company entered into an agreement to sell to the Free Gold Mining Company the mines for $1,500,000, and last Wednesday this company, organized by Isaac Trumbo of this city, appeared in court and asked for a temporary injunction restraining these trustees from working the property and to quiet title. The writ of injunction was granted, and C. W. Pauly of San Diego was appointed receiver of the property, with his bond fixed at $25,000 and compensation at $400 a month.

THE United States Geological Survey has issued a statement of the mineral products of the United States for 1896, and corresponding figures for each year since 1886. The total value of all minerals is placed at $621,969,943 for 1896 against $622,687,668 for 1895. The non-metallic minerals for 1895 were valued at $339,774,029 and for 1896 at $334,187,374. Metallic minerals for 1895, $281,913,639; for 1896, $286,781,570. The greatest increase in value of the metals was in copper which for 1895 was valued at $38,682,347 and in 1896 at $48,694,267. Next came gold with an increase from $46,610,000 to $53,088,000. Silver increased from $72,051,000 to 76,069,236; zinc from $6,278,020 to $6,519,920; aluminum from $464,600 to $520,000; antimony from $68,000 to $84,290 and nickel from $3,091 to $4,464. There was a decrease in iron from $105,198,550 to $90,250,000; lead from $11,220,000 to $10,472,000 and quicksilver from $1,337,131 to $1,075,449. While there was, generally, an increase in quantity in most of the non-metallic minerals the decrease in price made the value somewhat less.

The Situation in the Comstock Deep Levels.

Written for the MINING AND SCIENTIFIC PRESS by DAN DE QUILLE.

It is evident from paragraphs appearing in Eastern and European papers that the impression pretty generally prevails that the Comstock lode has been explored to the greatest depth possible; that with the exception of a few scattering streaks and bunches of ore in old levels above the Sutro tunnel the mines are exhausted. Some assert that at the depth of 3000 feet, or a little below, the lode pinched out; others, that at the depth of about 3000 feet only barren quartz was found. But the notion most generally prevalent is that at the bottom of the deep shafts such rivers of water were tapped that the mines were all flooded and the miners drowned out, no pumps being capable of handling water that poured in from the subterranean depths. The conclusion arrived at by the majority of outsiders is that in depth the Comstock is dead and that work can never again be done on the great lode below the points where sinking was suspended in the Jacket, Union, Combination, and other deep shafts.

Now, the fact is that the big lode is very much alive and at no very distant day it will be pumped out and work at depth resumed. With the water out of the mines there is nothing to prevent the exploration of the lode to the depth of 6000 feet or more below the surface. A great mistake was made when pumping was stopped and the mines allowed to fill with water to the level of the Sutro drain tunnel. In resuming work on the lode at depth the greatest expense will be in draining the shafts, drifts and other openings of the water that has accumulated in them. Most of these openings, however, are at no great depth below the level of the Sutro tunnel and when they have been pumped out only the shafts will remain to be drained. As the water will at first have to be lifted but a short distance, it may be raised very rapidly by putting in a number of pumps to be run by electricity or compressed air. Such pumps may be used until the long drifts, crosscuts, winzes and other openings of the old submerged levels are drained, when it will only remain to pump out the shafts.

Although the mining men of the Comstock have always claimed to be world beaters, they failed to "fill the bill" when they backed out of their line of big shafts at the depth of 3000 to 3300 feet. They then took a back seat and have since been passed by the miners of Lake Superior, Australia, Bohemia and other countries. Doubtless they could have gone ahead had the order been given to continue, but the stockholders hungered for dividends and clamored for a return to the old upper levels (above the Sutro drain tunnel), where it was known that large amounts of paying ore had been left behind in the race after depth. So the work of exploration was stopped and the miners set to work on the sure thing to be found in the ore bodies lying high and dry in the old upper levels.

There was no trouble in handling the water at the bottom of any one of our deep shafts. The water that flooded the mines of the south end of the Comstock lode came in at a point 350 feet above the bottom of the Yellow Jacket new shaft, the deepest on that division of the lode. February 13, 1882, an immense "pocket" or reservoir of water was blundered into in a drift that was being run from the Jacket shaft into the Exchequer mine on the 2700 level. The Yellow Jacket shaft was at that time 3050 feet deep; the water from the Exchequer thundered down into it and caused the stoppage of all operations except pumping. The Jacket people pumped and bailed an average flow of 110 miners' inches a day for some days, yet the water gained on them and eventually raised to the source of supply on the 2700 level of the Exchequer. The water then filled all the mines of the Gold Hill end of the lode from the Jacket down to the Caledonia.

Pumping was continued, however, in order to exhaust the subterranean reservoirs in the Exchequer, till March 28, when the water had been so far lowered that it stood only 950 feet above the 3000 level of the Jacket shaft. Then, as no combined arrangement could be made among the several companies intrusted to continue the work and drain all the mines, the Jacket Company stopped pumping and shut down their works. This stopped all work below the level of the Sutro tunnel in the whole line of south-end mines, and they still remain flooded.

Had proper precaution been observed by the Exchequer people and a drill-hole kept in advance in the drift, there would have been no trouble. In such a situation a diamond drill should have been constantly employed in "feeling ahead" for water. When water was tapped, the drill-hole could either have been plugged up or a pipe and cock could have been put in and the flow drawn off as it could be handled. To blunder into such a big body of water was a piece of very bad management.

No mine at the north end of the lode, in Virginia City, was flooded by the water being tapped in the Exchequer. The Union Consolidated mine was down to a vertical depth of 3350 feet when work below the Sutro tunnel level was discontinued because of a general demand of stockholders of all the mines along the lode for a return to the ore bodies on the old upper levels. This is the greatest depth ever attained on the lode. At that depth they were able to handle all the water found without any trouble and were also able to obtain a good circulation of air. But the clamor was for dividends, and all the mines were left to fill up with water to the level of the Sutro drain tunnel, in order to save the expense of pumping while working at points above.

The return to the old upper levels was not a bad move, as good bodies of ore were found and an immense amount of bullion was obtained. New bodies of ore were found in the Consolidated Virginia & California, Hale & Norcross, Confidence, Yellow Jacket, Crown Point, Gould & Curry, Savage, Chollar, Best & Belcher and some others. The Con. Cal. & Virginia paid steadily $108,000 monthly in dividends; the Confidence and Hale & Norcross paid dividends in 1888 at the rate of $49,000 to $50,000 a month, and some others paid smaller amounts. At that time nineteen mines were at once producing ore—more than ever before at any one time in the history of the lode. A few examples will show the rate at which some of the mines yielded from the old upper levels after the return to them: Con. Cal. & Virginia, in 1888, for the quarter ending March 31, $921,903.77; Chollar, $21,795.70; Confidence, $42,-541.72; Hale & Norcross, $236,047.32; Kentuck, $13,-055.50; Potosi, $56,461.16; Yellow Jacket, $121,027.82. For the quarter ending June 31, the same year, several mines did still better, the Hale & Norcross producing $451,740 and the Confidence $401,293. During the year the Comstock pay-rolls aggregated from $250,000 to $300,000 a month. Thus it will be seen that the stockholders were not much to blame for wishing to cease pumping water for a time and go back to the "flesh-pots" of the dry upper levels.

At the time when operations were discontinued in the deep shafts and a return made to the old upper levels the Combination shaft had reached the vertical depth of 3250 feet. At that time there was but one deeper vertical shaft in the world—the Adalbert shaft in the silver mines of Bohemia, which was at that time 3280 feet deep, but has now reached a depth of 3672 feet. At the Combination shaft drifts were run west to the lode at the 2400, 2800 and 3000 levels. On the 3000 level the distance from the shaft to the east wall of the lode was found to be only 250 feet. The lode at this depth was of undiminished width and well mineralized; indeed the Hale & Norcross Company (through whose ground the drift was run) had a good showing of ore. So much for the story of the lode pinching out at depth. In the Belcher mine, south of the Jacket, excellent prospects were being obtained on the 3000 level when the Exchequer people let in the water and flooded the whole south end of the lode.

In the deepest workings on the leading mines of the Comstock from the Union Consolidated south to the mines of Gold Hill the lode was found to hold its width, and at several points was well mineralized on the 3000 level, as at the Hale & Norcross where they had a good showing of ore when the order for a shut-down and return to the old upper levels came. On the 3000 level of the Belcher good streaks and bunches of ore were making their appearance when the mine was flooded by the rush of water from the Exchequer. Though no rich bonanzas were in sight there were no discouraging features developed. At the Union Consolidated a change in the appearance of the material composing the vein was observed, which by some was considered unfavorable, as in the assays there was a falling off in silver and an increase in gold. The increase in gold was to the northward, and it is now thought that had work been continued paying gold-bearing quartz would have been developed. At that time, however, gold alone was not being much sought after.

No gold or silver lode has ever been found which showed paying ore continuously in all parts at the same time. Between bonanzas there is always a zone of barren or low-grade quartz. It is very probable that another line of bonanzas will come in a short distance below the zone reached in the Union Consolidated, Combination, Jacket and other deep shafts. The indications were that they were on the top of ore bodies at the Hale & Norcross and Belcher when work was stopped. There is nothing to prevent the drainage of the lower levels of either the Gold Hill or Virginia mines. No water exists in the mines above the 1600 (Sutro tunnel) level, therefore all there is to be handled is the dead water which has gradually accumulated in the shafts, drifts and other openings. Pumping operations at the Alta, Crown Point and other mines have shown that a single company was able to lower the water. Had other companies stood in with the Alta or the Crown Point at the time they were pumping the whole of the Gold Hill mines would have very speedily been drained.

In 1891, there was a grand excitement in regard to the resumption of mining in the deep levels—more than is now seen in view of the proposed drainage of American Flat. James L. Flood, John W. Mackay, Alvinza Hayward, W. S. Hobart, James G. Fair, S. L. Jones, B. F. Sherwood, R. F. Morrow, and all the big mining men on the coast were enthusiastic in regard to the resumption. Hayward said: "We now feel that deep mining on the Comstock should never have been abandoned." Flood said: "Within six months work will be in full blast from one end of the lode to the other." The Combination shaft was to be started first, then the Union Consolidated, C. & C., and other works were to fall in and assist. There were many meetings and consultations of leading mining men, both on the Comstock and in San Francisco; Charley Mathewson reported a plan of operations at the different shafts, Roger Prendergast was appointed superintendent of the Union Consolidated shaft, with orders to overhaul the plant and get everything ready for starting. At this time Flood said to a San Francisco newspaper man: "The Combination will start up again very soon—how soon, I can not tell you exactly, but it is only a matter of days now." Then there occurred some kind of disagreement and with some pulling one way and some another, the whole scheme, so enthusiastically received at first, died out in wranglings as to methods. No one thought there would be any great difficulty in sinking the shafts some hundreds of feet deeper, and all were quite sanguine that good bodies of ore would be found at no great distance below the 3000-level.

At that time the only example in deep mining that Comstock men could look to for light was the Adelbert shaft, Bohemia, and that was only 3,280 feet vertical, but 30 feet deeper than the Combination shaft when work was stopped. Now we have at Lake Superior the Calumet and Hecla shaft 4900 feet in depth; the Tamarack, 4450 feet, the Adelbert, Bohemia, 3672, and several other mines (principally coal) from 3600 to 3900. The Bendigo gold mine, Australia, has reached a vertical depth of 3350 and is still going down in good pay. With advanced methods and improved machinery no one now sees an end to the depth that may be obtained. In other regions the miners are still going ahead and many of them are now far beyond the point where the Comstocker halted.

By means of the Sutro tunnel a new and lower working surface has been created. The water pumped has only to be raised to this new surface, and through two miles of branch tunnels and many connections with shafts and winzes. There is everywhere a good circulation of pure fresh air. It is as though 1600 feet of ground had been cut out and removed. All kinds of mining work can be done on this new artificial surface as well as above on the old natural surface. This being the case we find that the deepest workings on the Union Consolidated have a depth of only 1750 feet below the new working surface, and that a shaft 3000 feet deep, measuring from the old natural surface, is only 1400 feet deep when measured from the new surface. By means of the Sutro tunnel, its two miles of branches along the lode and its many air connections through shafts and winzes, a base of operations has been established from which it will be as easy to sink to a depth of 3000 feet as it was to sink to that depth from the natural surface.

Mr. Flood, Hayward, Mackay, Hobart, with the other mining men mentioned above and very many operators in mining stocks that might be mentioned, were in 1891 very enthusiastic in regard to a return to the deep levels; the chances are now as good as they then were—whatever ore bodies were then in the deep levels are still there, and should be looked for. The whole of the mines on the lode need not be opened at once. The Gold Hill mines may be first pumped out, or work may be resumed in certain sections of the Virginia City division of the lode, starting wherever there was some ore in sight when work was discontinued.

There are no great difficulties to be encountered in sinking to a greater depth at any point. Pumps driven by Pelton wheels may be set up on the Sutro tunnel level, and these would throw out the water very rapidly to a depth of several hundred feet. Supposing this work to be commenced at the Combination shaft, the big hydraulic pumps would soon be reached and recovered. These pumps are at the 2400, 2600 and the 3000 levels. Where the water had been lowered 800 feet the upper pump would be reached and 200 feet below that the second pump would be recovered. At the Combination shaft are Cornish pumps that could be run until the big hydraulic pumps were recovered. With both the Cornish and the hydraulic pumps at work 5,200,000 gallons of water can be raised each twenty-four hours. As the accumulations of water in the shafts and drifts are not from living streams, to pump them out is like pumping out a cistern.

The resumption of deep work at the Combination shaft need not interfere with the scheme for the drainage of American Flat. Only a certain number of men can be worked in the proposed drain tunnel, and there are certainly enough believers in the possibilities in the Comstock at depth to stand in and make a test at some point. Such a movement would give new and real life to the stock market. Old-time stock operators who are unmoved by strikes in the old upper levels would all wake up and try their luck when it came to the exploration of new ground at depth. As things now stand, no one knows but what work in the deep shafts may have stopped just on the apex of a third line of bonanzas richer than any found above.

Condition of Gold Mining in California.

From an article written by CHARLES G. YALE for the State Board of Trade.

The character of mining carried on in California in these days is entirely different from that done by the miners who came to the State in the "days of '49," when very simple appliances were all that they required to obtain the gold which the concentrating forces of Nature had gathered in the gulches, ravines, canyons, creeks, river bars and river beds. The pick, pan, shovel, and rocker, long-tom or sluice, were all the implements necessary, for this was the era of placer mining, when fortunes were gained in a day, and labor, not capital, was the prime requisite for successful mining.

At that time all the mining done was placer or surface work, and only the richer diggings were touched. Very little skill or experience was necessary, and the early-day miner collected the gold in quantities which now seem wonderful. In the one year of 1852 the sum of $81,294,000 was taken out. Gradually the area for this surface mining began to be narrowed down, and attention had to be turned to other sources of the gold for which all were in search. To-day, however, many of these old claims are being worked over and over by Chinese miners, and, as they are satisfied with small wages, there are plenty of places for them to mine. White men own most of the ground, which they lease to Chinamen, and poor mining ground is now called "Chinese diggings."

After a time it was discovered that the great, red hills in the foothill and mountain counties in the central and northern part of California contained plenty of gold, though the material was much poorer than the concentrated shallow places, necessitating the handling of more dirt. Then hydraulic mining was invented. Then, too, men began to inquire into the sources of the rich placers, and commenced to hunt for, open and work the quartz ledges.

The collection of gold from these sources is a much more expensive operation than taking it from shallow surface placers, and very different systems have to be adopted. The method is practically the same as that pursued by nature — concentrating the heavier valuable material and washing away the lighter—but man's efforts are slow, and it takes time and money to handle the material.

With the necessary change in the character and system of mining came an entire change in the social conditions and methods of the miners themselves. People who only know about gold mining in California from the old stories of the mining camps in the "days of '49," would recognize none of the features should they visit the mining regions of the State in 1897. The nomadic habits of the miner have entirely disappeared, and with them the recklessness, drunkenness and extravagance which were supposed to universally prevail. It is proper to note, however, that such habits were not universal by any means, though among the thousands who came were numbers of men who made necessary lynch law and vigilance committees. Around all the larger mines of the present day are permanent settlements, where the miners live with their families, content to work for wages and a sure income. The larger mining towns of the State, where there are a number of mines in operation, have lost entirely the old features of mining-camp life. The people have settled down to mining as a permanent business, and conduct it like any other industry.

The principal producing mines of the State now belong to private companies or individuals. Many small claims and prospects are owned by individual working miners, but capital is required to open and work quartz and gravel claims to conduct the business on an economical and profitable basis. Many of the wage-working miners, of course, do more or less prospecting for themselves, and many own small claims, which they work in a desultory manner until they can be disposed of to people in a position financially to bring them to a producing condition. California, as the pioneer of the gold-producing States of the Pacific coast, and the one which has made the greatest aggregate yield, has very naturally long since passed its "boom" period, and its mining affairs are conducted on the same principles as any industrial business.

From all classes of gold mines the average annual product of the State for the past forty-eight years has been about $26,500,000, the total output of gold since 1849 having aggregated $1,282,398,779. The annual yield is now between $16,000,000 and $17,000,000, and has shown an increase in each of the last three years. In view of the many developments and investment of capital, the annual yield is expected to reach $20,000,000 before long.

The conditions under which mining is carried on have changed materially for the better. The mining country has been more densely settled, means of transportation have vastly improved, machinery has been perfected and cheapened, all supplies have become cheaper, and radical changes have taken place in the systems of mining and of handling and treating ores. High-priced officials and supernumeraries have been done away with; there is a closer system in conducting operations, and all the appliances necessary are not only more perfect but cheaper. As a result of all these factors, ore is now mined and milled at a much less cost than formerly, and mines that twenty years ago would run a company in debt can now be made to pay a handsome profit. Each year has shown a gradual reduction in cost, and improvement in the method of treating ores, and with every dollar off this cost, hundreds of mines have been added to the list of producers. The successful treatment at low cost of the rich auriferous sulphurets found in the ores of nearly all our quartz mines has been an important factor, as at one time little attention was paid to them, whereas, now all mills are equipped with appliances for saving them for ultimate treatment, in addition to the ordinary methods for saving the pure gold.

There is plenty of opportunity for investment in the gold mines of the State, but this should not be undertaken by those unfamiliar with the business, except upon the advice of persons of experience. Even those long in the business, and who have invested large sums, do not purchase properties or interests in them on their own judgment alone, but employ skilled experts to make examinations and reports. There are so many conditions to be taken into consideration that it is foolish to invest money in this kind of property without very careful examination in advance.

While the principal product of the mineral world in California is gold, there are many other substances mined, which swell the total valuation of the mineral output of the State to upwards of $24,000,000 a year. Several of these products are not mined in other States. Quicksilver, for instance, is nowhere else mined on this continent, and since we first began working it California has produced upwards of $77,000,000 worth, and continues to produce it at the rate of over $1,000,000 a year.

For the last seventeen years the total silver product has been over $20,000,000. All the borax in this country comes from California and Nevada, and eleven-twelfths of that is from California. The annual output of this substance is from $600,000 to $700,000. This State produces more rock asphalt than any other, and is the only one yielding natural liquid asphalt. Magnesite, used in paper manufacture and for furnace linings, is mined here only. The only product of chrome in the United States is from California, and all the antimony is from this State and Nevada. The only platinum found in the United States is taken with the gold from the beach black sands and from the black sands of the auriferous gravel mines. The mineral oils are very valuable, and we stand sixth among the other States in value of petroleum product. The oil fields are only partly developed, there being still large areas of oil-bearing ground yet unopened. The value of the structural materials, including cement, clays, limestone, granite, sandstone, macadam, paving blocks, slate, marble, onyx, etc., is over $2,000,000 a year.

Assaying of Gold and Silver.

NUMBER II.

By JACOB B. ECKFELDT, Assayer of the United States Mint at Philadelphia, Pa.

The proportion of silver in the alloy referred to is ascertained by the humid assay. For this purpose a definite proportion of the alloy is weighed, inclosed in lead with sufficient fine silver, for the proper working by the humid assay. The bullet is then placed in a cupel and retained in the furnace until the whole is melted, when it is immediately taken out, without allowing any absorption by the cupel. When solidified, the alloy thus formed is placed in a bottle and dissolved in nitric acid.

Another method of making this assay for silver is to weigh a definite proportion of the alloy and carefully fuse it under cyanide of potassium, with an excess of pure cadmium or zinc. As soon as fused, the alloy is poured, the resulting button, freed from cyanide, is dissolved in nitric acid, together with the proper quantity of fine silver for the humid assay working. After complete solution, the assay is proceeded with as further described.

The object of the cadmium is to form an easily partible alloy—that is, one in which the gold is thoroughly broken up by the acid, and any alloyed silver completely dissolved.

Within a few years an improvement has been adopted in the apparatus for assaying as conducted in the United States Mint. The cornets are prepared as previously described, but, in place of boiling them in flasks, they are deposited in separate cups of platinum, arranged in a basket-like apparatus of the same material, capable of holding sixteen assays in a small space.

This is placed in a basin or cup of platinum containing nitric acid of the required strength—acid at 22°, if three parts of silver have been used, and at 32°, if but two parts. Heat is applied and the acid boiled for ten minutes; the baskets containing the cornets is then withdrawn and placed in another similar vessel, and the acid at 32° is poured over them and boiled as before. This change is generally made the third time to insure a complete extraction of the silver. To prevent the escape of the fumes from the decomposition of the acid, a dome-shaped covering is placed over the vessel, which connects by a tube with a condenser, or a flue.

The boiling operation, or digestion, having been completed, the cornets are washed, dried and annealed without removing them from their respective separate compartments in the basket. The great advantage in this operation is the uniformity with which the cornets are treated, all being subjected at once to the same action from the acid. It also saves time and trouble in repeated decantings. It is somewhat liable to the danger of spoiling the whole set by the breaking up or by transposition of some of the assays, but with due care this will rarely happen.

The foregoing operation does not entirely remove the silver, although it was formerly supposed that it did, and thus the gold coins of the best mints showed a deficiency from the true or legal fineness, even when it was not intended. This small quantity of silver which persistently clings to the gold is called the "surcharge."

The surcharge of silver is very minute and varies, say, from two to seven or eight-tenths of a thousandth. It is ascertained in each assay or set of assays by the "proof" already mentioned, which shows the amount of silver retained by a known weight of gold under identical treatment with that given the sample under assay. The weight of the cornet from the proof strip will be greater than that of the gold in it by the amount of the "surcharge." The surcharge thus found is therefore to be deducted from the weight of such cornets as accompanied the proof through all the processes of treatment.

In assaying fine (or nearly fine) gold, we weigh the proof to 1000 parts of our test gold; but in assaying ingots for coinage and the ordinary class of deposits, a proof of 900 parts is used, and in lower grades of gold a synthetic proof is used corresponding to the approximate or supposed fineness of the metal, the object being to subject an alloy of known composition, closely similar to that under test, to identical treatment.

After the ignots have been made, the first and last ingot from every melt are carried to the assay room and a sample slip taken from each. These are assayed separately and their fineness reported to the melter and refiner. The ingots or melts which may be too far from the legal standard, or fail to show a uniformity of fineness in the assays, are condemned. They are then remelted with the proper addition of either gold or copper, as the case may require, to bring them to standard.

With every sample of gold assayed there is also a corresponding duplicate assay made, to guard against any error which might possibly occur in the various assay processes. Besides this, the duplicate serves to show if the alloy be of a uniform fineness throughout. If such is not the case (as shown by the variation of the assays), the mass from which the sample was taken is remelted and stirred to make it homogeneous, after which it is assayed in duplicate as before.

In case the gold for assay be of low fineness, or if there is but a small proportion of gold in the alloy, it is found to be expedient in preparing the assay to add sufficient fine gold so that the assay may contain 900 parts of gold in the 1000. By this course the exact fineness of the alloy is ascertained, otherwise an allowance would have to be made for a slight absorption of gold by the cupel, which will happen when a large proportion of alloy is present. When the weight of the cornet is ascertained, the amount of fine gold which was added must be deducted, the difference being the fineness of the original alloy.

It sometimes happens that the ordinary amount of lead is insufficient to cause the entire elimination of all the base alloy in the gold. It may be, too, that the cupel is not capable of absorbing the entire amount of lead which such an assay would require. To avoid these difficulties, it is customary to weigh the assay at one-half the usual weight, adding fine gold as described above, thus diminishing in like proportion the amount of base metal to be oxidized and absorbed by the cupel.

Assay of Silver.—The object of the silver assay is to determine the exact proportion of silver contained in any bullion, plate or coin. The assay does not regard the nature or variety of the alloying metals, but simply their proportionate weight to that of the pure silver. Incidentally, however, for the benefit of the melter and refiner (in the mint assays), or for his own information and experience, the assayer takes cognizance, in passing, of the nature of his solutions and precipitates; also, of the ductility of the metal to be tested.

When the silver alloy is melted, a sample is taken out for the assayer. This is done by dipping a small portion from the pot and pouring it into cold water. The resulting granulations are carried in copper cups to the assayer's laboratory. The reason for this method of sampling silver is elsewhere explained.

After drying the granulations by heat, about twenty-hundredths of an ounce are reserved in the assay room and the remainder returned. The sample lots are now laid out upon a board containing cup-like sockets bored at regular intervals and numbered. A granulation from each sample is next hammered and rolled into a thin strip, this being merely for convenience in cutting for the adjustment in weighing the assay. Each strip is laid beside its kindred granulations and numbered by stamping. The board is now removed to the assayer's "weigh-room."

(To be Continued.)

Mining Summary.

CALIFORNIA.

Amador.

Ledger: On the Pocahontas at Dogtown the crosscut from the shaft at the 400-foot level is progressing. A ledge has been encountered which shows good ore at a shorter distance from the shaft than was anticipated.

Hatch & Marshall, who for many years have held the Marklee mine in idleness, have sold the property to a company of mining men, among whom are Flint of San Juan, Wilson and Root. They have purchased a mill.

Two weeks ago workmen in the north drift of the Anita mine, who were driving toward the so-called Schober chimney of ore, came into a body of quartz, and at the same time opened up a flow of water which, before they could leave the face, had risen about two feet in the levels. The flow continued, and in spite of the constant and continual use of all the machinery of the mine the water continued to increase until the 1000 feet of levels were filled with water. Arrangements are now being made to construct a large permanent hoist on the property.

Dispatch: At the Monte Cristo or Robinson mine they have 68 feet of paying ledge matter. There are three tunnels on the property. The lower one will strike the ledge 450 feet below the surface at a distance of 600 feet from its mouth. Mr. Dillon has just put in a mill with a capacity of 70 tons in twenty-four hours.

At the Iron Mass in Robinson district Mrs. McLaughlin has recently erected a steam hoist over the shaft, which is now down 200 feet. It is intended to sink the shaft 450 feet deeper at once and then run levels from that station. Drifts have been run from the 200 foot level 180 feet east and 80 feet south, developing a well-defined ledge of white quartz similar to that in the mother lode, varying in thickness from 4 inches to 5 feet.

At the Amador Queen the shaft is now down 585 feet and a crosscut is being driven to the east to intersect the footwall. In excavating for a dam at the 500-foot level 30 feet of vein matter which assays well was gone through, but it was not of sufficient solidity to justify working.

The owners of the Valparaiso are sinking on their mine and the rich rock continues in the shaft. Last week 57 ounces of rock yielded 27 ounces of fine gold.

Work on the Doyle mine has not yet been resumed, but it is understood that the new company recently incorporated intends beginning operations within a short time.

The flow of water in the Alma mine still continues, but the management has been able to handle it so far, although the skips are kept pretty busy.

Republican: The tunnel to tap the gravel channel of Butte basin is in 1700 feet, with 300 feet yet to run to get to the point aimed at. No pay gravel has been struck as yet, but marl has been entered, and this is generally understood to be in the vicinity of the pay channel.

The repair of the shaft at the Zeila has been finished and the mine will be started in full blast in a few days. This resumption of mining will give employment to about 100 additional men.

Calaveras.

Chronicle: The Excelsior gravel mine, owned by Fahey and Knell, has been sold to the Hexter Mining Company. The claim consists of forty acres. The purchase price was $2,500.

A large flow of water has been encountered in the Esperanza mine, and it is a splendid indication of a large pay chute in close prominity to the present workings. The shaft has now reached a depth of 600 feet.

The work of grading for the mill which is to be erected on the Guiffra mine is completed.

El Dorado.

Nugget: At the Unity mine, Gold Hill district, the shaft has reached a depth of 370 feet. It is the intention of the Pine Hill Mining Company, the owners of the property, to continue sinking to 400 feet. A tunnel will then be run north from the 400-foot level and a crosscut will then be driven through the ledge.

The Oriental mine has been bonded to an English syndicate and the work of developing the property is going on rapidly. Rock has been recently taken from the property that assays well. The ledge is large.

Kern.

Californian: The prospects of the Amalie mine are very bright. Fine ore has been struck at the 400-foot level, while good ore continues to be taken from the 250-foot level.

Mariposa.

(Special Correspondence).—The Merced Gold Mining Company's mill is running full time. Thirty stamps are dropping on ore from the Mary Harrison and the rest are supplied from the Malvina mine. A body of very high grade ore has been opened on the 600-foot level of the Mary Harrison in the old shaft.

The Horse Shoe Bend group of mines, comprising eleven claims and a water right on the Merced river has been bonded to Conrad Kohrs the Montana cattle man. The price is said to be $50,000 and the bond runs to Jan. 1st, 1898. A. C. Cabel, formerly superintendent of the Louisiana mine has a force at work opening up the property.

A 3-stamp mill is being placed this week on the Deer Flat property operated by J. Leonard and others.

It is reported that Hamilton Smith and his associates, who recently purchased an interest in the Mariposa Grant, have secured an option for one year on the Red Banks and Crown Lead properties. The former is owned by Henry Bratnober and A. Wartenweiler, and consists of the Daisy, Jubilee, Stevenson and Syndicate claims on the mother lode, on the north side of the Merced river, opposite and adjoining the Mariposa Grant. These properties have been developed to a depth of about 400 feet by tunnels and a large amount of milling ore is in sight. The price is said to be $100,000. The Crown Lead property adjoins the Red Banks to the northwest and also partly overlaps it on the east side. It consists of the Crown Lead, Crown Peak, Adelaide, Anderson and Midas claims and four patented mill sites. The property is owned by Mrs. Mary McCrellish and the price is reported as being $125,000.

A force of men has been set to work extending the crosscut tunnels of the Red Banks to cut the Crown Lead vein. Valuable water rights on the Merced river go with each of these properties, which together comprise about three miles of the "west vein."

A small prospecting mill is being erected on the Louisiana mine.

Manager McSherry has severed his connection with the Bunker Hill Company. The mines have been temporarily shut down pending a reorganization of the company.

After crosscutting the ledge at a depth of 60 feet sinking has been resumed in the new shaft on the Bully Hill.

The new compressor plant on the Bondurant has been started up and is working satisfactorily.

The force at the Contention mine has been reduced for a short time.

There are more men working in Coulterville and its immediate vicinity this season than at any time in the past ten years.

The Garbarino property, comprising 3000 feet on the east branch of the mother lode and between the Virginia and the Mary Harrison has been bonded for $10,000 to F. H. Hill.

Coulterville, Cal. July 1st, '97

Nevada.

(Special Correspondence). — In traveling over the county, one is pleased to find the great amount of new prospect work, undertaken both by capitalists and by young men who, out of their savings, are making investments until compelled to go back again to their earnings for additional means. The county is attracting new people from week to week, and new work and purchases are recorded almost every day.

The Gaston Ridge Mine, a company incorporated under the laws of New Jersey, of whose extensive workings I wrote the MINING AND SCIENTIFIC PRESS a few weeks ago, has cut the ledge at 1916 feet, and thus far have 16 feet of ore and 650 feet backs, draining also the old upper works. The footwall is slate and the hanging wall is syenite. This work has been an expensive undertaking and has been watched with interest. Perseverance, coupled with careful previous study, is now rewarding the company, and Mr. Harmon, the superintendent, is in high feather.

The La Suerte Gold Mining Co. are erecting new hoisting works on the property recently purchased from Kirkham and others. They have a 2-foot ledge of good ore, a shaft 200 feet and a tunnel on the vein 1600 feet. The company (San Francisco people) are preparing to erect a 10-stamp mill.

The Mark Hanna, owned by four young men working in the Champion mine, has a tunnel 180 feet. They expect to reach the ledge within 25 feet. The croppings were from 8 to 12 inches and assayed $1.25. There are four claims in the group and they are owned by Rosewald, Oliver, Beedle and another.

The successful stipulation and consequent dismissal of the You Bet troubles give eminent satisfaction in this section.

The old-time Sneath & Clay mine, one-half mile from town, was sold yesterday to Sidney Smith of Cleveland, J. H. Schockley of Cincinnati and Dr. Tickell of this city.

A company has been incorporated which proposes to operate the large nickel and cobalt ledge between Nevada City and Washington, of which a notice appeared in the MINING AND SCIENTIFIC PRESS some weeks ago.

Nevada City, July 4th, '97.

Herald: The Champion Mining Company have a few men at work at the Merrifield, and are preparing for more extensive operations on that property.

Some rich rock has lately been taken from the Reward mine which is looking well, and the ledge averages about 16 inches in thickness.

Union: Since the big ledge was struck at the California mine in God's country drifts have been started both ways and will be run along the ledge for some distance, after which a practical mill test of the ore from different points will be made. The company has over 1000 feet of backs to work on.

Union: J. Lyons has been running a tunnel from Deer creek to tap a ledge on the Deadwood ground. It is known that the ledge is still about 150 feet distant, but last week another ledge was struck on the way which assays very high.

The sale of the Sneath & Clay mine has been effected to English capitalists whose representatives are now in Grass Valley.

Poorman & Hasting have done a great amount of work on their claim on the Middle Yuba river below Pike City and have drained the river for a considerable distance. Everything will probably be in readiness to commence washing the gravel in about a week. The derrick is being put in place and about twenty men have been employed.

Placer.

On the Morning Star mine at Iowa Hill the adit tunnel is 4,200 feet in length. The gravel is worked from 7 to 14 feet in height, the channel averaging about 250 feet in width. The gravel is slightly cemented, which necessitates crushing. The mill has ten stamps, which crush about 135 tons per twenty-four hours. The development or dead work done in the mine is unusally large. Tunnels and drifts have been advanced ahead of the regular work, so that there is two or three years' steady work opened up. The mine has paid regular monthly dividends for the past seven years. The mine employs about sixty-five men.

The Big Dipper is worked through a tunnel 4,000 feet long. It has a 10-stamp mill and the workings are similar to the Morning Star. The pay channel varies in width from 50 to 250 feet. The gravel breasted out is never less than 6 feet, and sometimes as high as 20 feet. The work of development was commenced in 1890.

Plumas.

National-Bulletin: During the past week Mr. Hazzard has been cleaning up at the Plumas Imperial mine, and results are reported to exceed all expectations. During the last days of hydraulicking a well defined and rich channel was opened up.

Sierra.

(Special Correspondence).—The old Brush Creek quartz mine at the Mountain House, abandoned twenty years ago, is being reopened by the Goodyear Mining Co., composed of Chicago and Philadelphia people. John Myers has charge of the work.

Lewis and McGregor are running a tunnel about 100 yards from the hotel. At 260 feet they struck an 8-foot ledge. The footwall has not been reached. There are sulphurets in quantity and coarse gold is plainly visible. There is in this formation a species of gold-bearing ore that resembles jaspar rather than quartz, and old miners are puzzled what to call it.

Meehan, Benson and Tangway, who are taking coarse gold from their channel property on American Hill, have started a new tunnel on the opposite side of the ridge, from which a large amount of gold has been taken in former years of superficial methods of gravel mining. They will cut the same channel, on which they own 200 acres.

Craft and Smith are running several tunnels on the Scotia & Allis. The main tunnel is 250 feet. They have not attained much depth as yet, and are running mostly for pockets. The ledge is small but rich. It is a schist with bunches of gold-bearing porphyry. The property is at the head of French ravine, in which a piece of gold was found in pioneer days weighing $10,000, imbedded in a slab of quartz.

The North Fork Gravel Gold Mining Co., incorporated, just at the edge of Forest, are into the ridge 3300 feet, having taken up a tunnel worked thirty-eight years ago, and through which pay gravel was found the entire way. It is known from the old works that the channel is 200 feet in width. Mules draw a train of fifteen cars in a train through the tunnel. It is free gravel and is run through sluice boxes. J. O. Jones is superintendent.

Forest, July 3d, '97.

Shasta.

Searchlight: At the Iron Mountain mine from 300 to 400 cars of ore are removed daily. About 325 men are constantly employed, 175 working on the day shift and the remainder at night, the latter having nine hours of employment as against ten by the former. To the men working in the mine $2.60 is paid per day, the others receiving 50 cents less, except those employed in outside work who receive but $1.60 per day, under ordinary circumstances.

The Hidden Treasure, owned by the Mountain Copper Company, is showing up well. About twenty men are employed. The ledge was tapped by the lower or second tunnel at a distance of 250 feet. Drifting each way on the ledge was at once commenced.

Free Press: A new vein of ore about 11 inches wide has been struck in the Sabbath mine at Harrison Gulch.

Sam W. Cheney, manager of the Mammoth-Garfield mine in Old Diggings, will put in a power plant to operate the wire ropeway which was recently built to convey the ore from the mine to the smelter at Keswick.

Siskiyou.

News: The mining industry in the old Cottonwood mining district, which comprises Henley, the Klamath river for a distance of ten miles, Hungry creek, Beaver creek, Mt. Sterling, Empire creek, Bumble Bee creek, an area of twenty miles square, is looking up better than for many years past.

The Diestlehorst dredger operating in the Klamath below Oak Bar cleaned up $180 in two shifts last week.

Captain La Flesh has made a strike of good ore in his quartz mine on Rocky gulch, west of Henley.

Work on the Last Chance mine is going on, with a crew of twenty men working night and day shifts. The new machinery, including a hydraulic pump with a capacity of 5,000,000 gallons per day, has been placed in the pit.

The hydraulic mines of Hamburg Bar have all cleaned up and closed down owing to the lack of water. The present season has been three months shorter than usual, but the mines all yielded well considering the short time they were in operation.

Journal: Day & Co. of the Klamath River Flume and River Mining Company, are pushing their surveys as rapidly as possible.

The Minetta B mine, on Thompson creek, is still in operation, and the owners will commence putting in an elevator immediately. The mine will also be opened from the lower end.

LeLay & Utne will resume work on their quartz ledge west of Yreka next week, and will soon have enough ore out for another crushing.

At the Katie May mine on Greenhorn, they are still running a tunnel to tap the ledge lower down, and will be in a position, when the tunnel is finished, to take out a large amount of ore.

Journal: the old Bentz Bar mine on Klamath river, which was so rich a few years ago, and later sold to a Chinese company, has been turning out some rich gravel lately.

At the Phil Mott claim on the Klamath river they have commenced hoisting gravel.

The owners of the Minetta B Mine on Thompson creek have bought the Seattle placer mining property at that place for the sum of $12,000. This will give the Minetta B Company a splendid water right, as well as a good property, with a large amount of modern machinery. The mine just purchased was formerly the old Shiner mine, and was sold by T. J. Nolton several years ago to a company of Seattle capitalists for the sum of $10,000.

Trinity.

Redding *Searchlight*: At Hall City, across the divide from Harrison gulch in Shasta county, Hall & Carpenter have a mill with a capacity of five tons at work. On their Lucky Hall mine three tunnels intersect the ledge being in 70, 60 and 50 feet respectively. A winze is being sunk from the upper tunnel and is down 60 feet, following the ledge which has an average width of from 10 to 15 inches. Six men are employed at the mine, and considerable ore has already been stoped and treated.

Two 2-stamp battery mills are to be put up by Chambers & Harrison south of Hall City. The Green mines bonded by them and comprising the Yellowstone and White Rock mines are showing up well.

Tuolumne.

Banner: At the Jumper, next Sunday, will be one year since the twenty stamps started up—not one hour of that time being lost. The delivery of ore could easily keep eighty stamps busy.

There are about twenty lessees paying 25 per cent royalty to J. N. Gillis on the gross yield of the pocket mines on Jackass Hill.

Independent: Work on the ten additional stamps at the Dutch is progressing. When completed the mill will run twenty stamps.

At the Soulsby mine all is quiet, and no work is going on. When the property will be put in operation again is a matter of doubt.

At the Black Oak the ten additional stamps to the ten already in operation were started last week. The mine continues to prospect well.

This week twenty additional stamps to the ten already have been started up at the Confidence mine.

OREGON.

Monitor-Miner: Kennedy & Co. are operating the Oregon Bell mine on Forest creek. It is a free milling ore, running from 6 inches to 5 feet in width, and a tunnel has been run 60 feet on the ledge.

Rogue River Courier: John Bolt of Applegate has leased his Galice Creek mine to Santa Cruz (Cal.) parties.

Browning & Hannum have made a rich strike of decomposed quartz on Grave creek. They are putting up an arrastra.

The Oregon Bonanza mine is in good ore and the vein has widened out to 30 inches and is filled with pay.

Baker City *Democrat*: A clean-up of $5000 has been made as the result of 30 days' work by two men in a placer mine on Louse creek.

Z. C. Perkins is operating a placer property on the John Day river at the mouth of Big creek which promises good results.

R. Long has been washing dirt that averages 35 cents to the pan, and has found several nuggets that range from $3 to $12 in value.

The German mine is paying well. Pans in the wash run $1.35.

J. Clark has a claim that is showing up well, and most of the miners in the neighborhood are well satisfied with the results of their work.

WASHINGTON.

Spokesman-Review: The interest in mining properties on the reservation near Nelson is constantly increasing. Almost daily parties are coming in to do assessment work on their locations made last year. Quite a number are doing considerable development work and, as a rule, with satisfactory results.

On the Republic Clark Bros. have a force of 18 men at work. The Lone Pine is expected to open up with quite a force in a few days. The Tom Thumb is working with good results, as is the Black Tail and a number of other properties.

On the San Puel W. H. Greenbow and Dr. Powers of Ellensburg are working several properties. At Wolf's camp a large force is working, a Burleigh drill being operated on this property. On Lambert creek several parties are pushing work with success, as well as on San Pierre creek.

The Empire, west of Curlew, has grown to be quite a good camp. Over twenty men are now working on their claims.

H. E. Battin, manager for the Portland Mining Company, has done a lot of work on the Red Jacket and expects to sink 100 feet on the property.

Stewart & Fox are working on the Echo, Little Jennie and other claims. W. L. Curry is pushing work on the Crown Point and Morning Star. Charles McWilliam, associated with F. E. Baldwin and other Spokane parties, are working on the Minnesota Boy and Baldwin. John Ross is stripping quite a ledge on the Great Northern.

The Copper Queen, near Nelson, is now preparing to put a force of men at work.

BRITISH COLUMBIA.

(Special Correspondence). At Fairview the Tin Horn is working twenty-four miners and is putting up a new 20-stamp mill.

The Smuggler mine is dropping ten stamps all the time.

The Joe Dandy is working twenty-two men.

Dier, Davidson & Russell have thirty men working on different properties.

There are new strikes being made every day, not the least of these being two properties, one running 30 ounces gold and another 9 ounces.

Carr & Co. are shipping to the Tacoma smelter about 100 sacks per day. It has to be good ore that will stand wagon-hauling, freight and smelter charges. Five or six properties here could ship ore if people would push them. There is not another camp outside of Rossland or Trail where there are so many men at work and so many mills being built.

Fairview, B. C., July 3, '97.

Spokesman-Review: The bottom of the Le Roi shaft is now down 592 feet and has 6 feet of solid ore. It is said the mine never looked better, and is shipping from 200 to 250 tons of ore a day. The mine made a record Wednesday last, shipping during the twenty-four hours 470 tons of ore.

G. A. Pounder has sold his interest in the Early Bird Mining Company to Anderson Bros., of Albion, New York, for $10,000. The interest amounted to about two-thirds.

The Center Star sent three carloads of ore to the Trail smelter last week, this being their first shipment.

At Boundary creek a strike of galena in quartz has been made in the shaft of the O. B. claim, belonging to the Boundary Creek Mining and Milling Company, of Greenwood. The ledge contains about 3 feet of mineralized quartz, which is now for the first time showing galena.

The Anaconda, Columbia and Kootenay claims, situate in Providence camp, and owned by E. A. Bielenberg, have been bonded for an English syndicate by E. A. Woodhouse, M. P.

On the Golden Crown, in Wellington camp, the crosscut tunnel is now in the third lead, at 110 feet, which is about one-third of the distance it is at present proposed to run it.

Captain Moore and some of his associates, who recently sold the Idaho-Alamo and other groups in the Slocan, have secured a bond on the Roulette.

The final payment on the Silver Glance, on Woodbury creek, north of Ainsworth, has been made by John S. Baker, of Tacoma, and his associates. The claim was bonded January last for $10,000.

A new discovery of copper ore has been made in the Ainsworth camp, in the Jeff Davis mine. While some copper had been previously found, it was in small quantities, but the vein just uncovered carries about 16 per cent copper with some gold and silver.

At Slocan W. A. Coplen, one of the owners of the Skylark and Ranger, on which a bond was recently allowed to expire by the Hall Exploration Company, states that he intends to begin work at once on these properties himself.

The Ottawa concern, headed by Sir Charles Tupper, has bonded the Exchange group on Springer creek, in the Slocan district. The claims purchased are: The Victoria, Exchange, Skookum and Silver Plate. The property is thought to be of good value, and the consideration is said to be fixed at $42,500. Development work will begin soon.

On the Meteor, where the ledge has been stripped for a distance of 150 feet, there is an 18-inch ore streak showing the entire distance.

A strike has been made on the Alexander, at the head of Lemar creek, and adjoining the Black Prince group. This property, with the Dellie, were bought by Ralston McKaig, of Rosalia, Wash., about a month ago, for $4500, and a crew of men at once set to work.

The Howard Fraction made a shipment of ore last week to the Hall mines smelter at Nelson. The shipment amounted to twenty-two tons, and was packed over the trail nine miles to the Canadian Pacific Railroad dock.

Work is soon to be commenced on the Slocan-Liberty Hill group of claims southwest from Kaslo. Considerable work has been done in the past. It has been decided to run a 3000-foot tunnel through the main properties, which it was found would give a depth of over 1000 feet.

For the first six months of 1897 the returns of the custom house show the following shipments made:

BULLION AND MATTE.

	Pounds.	Value.
Trail smelter	118,809	.....

ORE.

	Approximate Tons.	Value.
Le Roi mine, Rossland	186	.....
Payne mine, Slocan	200	.....
Washington	32	.....
Whitewater mine, Slocan	15	.....
Noble Five mines, Slocan	53	.....
Black Diamond mine, Ainsworth	40	.....
Kootenay Ore Company, Kaslo	130	.....
Total for week	735	$ 85,176
Total so far for June	3,200	354,446
Total for May	2,995	397,797
Total for April	5,764	453,234
Total for March	5,822	677,881
Total for February	5,201	562,853
Total for January	4,543	675,506
Total via Revelstoke to May 12	2,296	223,382
Total so far for 1897	27,721	3,424,899

IDAHO.

Spokesman-Review: In the Seven Devils district almost the whole mineral belt is held by locations and relocations. This system has been carried on for sixteen years, with no development and but little assessment work. There are seventeen patented mines in the district and 15,000 acres in a solid body have been held for many years by methods adopted for the purpose of defeating the intent of the mining laws.

A report is made of a rich strike in the Poorman at Florence.

The Banner mine in Florence has started twenty men on development work. A mill will be put on this property within thirty days.

J. W. Kuykendall and W. E. Hines have discovered a ledge of high-grade ore on the reservation, thirty-five miles from Lewiston.

At Lakeview in the Keep Cool a rich strike has been made. Thirteen miners were employed in the lower tunnel and they struck a larger and richer body of ore than they had in the upper tunnels.

MONTANA.

Inter-Mountain: Several rich finds are reported from the Rochester camp in Madison county, and about ten different companies are engaged in washing the placer ground in that neighborhood with the small supply of water available.

The Watseka mine in Rochester basin has been leased and bonded to Butte parties and arrangements have been completed to sink the shaft 400 feet. The mine is owned by F. R. Merk and was worked several years ago by D. G. Bricker, the Colorado company and others.

Many of the scientific men of Butte have been experimenting for years to find a substitute for iron and steel in the precipitating process of copper water so successfully carried on in Butte for the past few years. During the past few weeks the Parrot Company have been experimenting with lime rock, a quantity of which is placed in the tank at the bottom of the shaft, instead of scrap iron. The copper is precipitated in the form of sulphides. No tests have yet been made to ascertain what percentage of copper was precipitated, the chief efforts of the company being directed to protecting the water column by robbing the water of its acid, the results obtained in that direction being very satisfactory.

The Montana Ore Purchasing Company last week sold 500,000 pounds of electrolytic copper at 11 cents.

The Anaconda's daily output is nearly 6000 tons of ore.

J. A. Finch and other Spokane men will develop the St. Lawrence and Richmond copper claims at Saltese, Mont.

Butte *Miner*: It is the intention of the Samson Mining and Development Company to put a force of men at work on their property in the New World district. This will consist of sinking shafts on both the Mint and Rosa, as shipping ore can be taken out from the time work is commenced. These shafts will be continued to a depth of 200 feet, when levels will be run and the shafts connected.

Operations have been resumed at the Eva May mine at Basin. About forty men will be worked at present. The mine is equipped with a concentrator of seventy-five tons capacity daily, and has been developed to the 50-foot level, where the ore body is said to show strong.

The Boston & Montana people are sinking in the Anderson mine and some good ore is being blocked out between the 200 and 300-foot levels. It is said that but little ore will be shipped from the mine unless the future work develops the fact that it will not pay the company to take up the bond now held on the property for $75,000.

The discovery of gold in placers on the Tongue river has caused a good deal of excitement in that section of the State. A movement is on foot among local capitalists to put in pumping machinery, water wheels worked by the current being the most favored plan, with the purpose of working the dirt on a large scale.

COLORADO.

Denver *Republican*: At Cripple Creek Duston & Whitney, who are working under a sub-lease from Vaughn, have shipped in June eighty tons of average $200 value. In the stope from the 60-foot level north they opened a 4-foot breast of ore.

Nobles, Crooks, Buckley & Lands are preparing for a hoist on their contract from Kellogg. They have some rich sylvanite and fluorite.

Two tunnels are being driven by hand from the Rosebud gulch for the big west vein of Beacon, the Standard and the Old Gold. In the latter at 300 feet a parallel vein was cut in the Columbia ground.

W. H. Pine, who is leasing on the Buckeye of the Old Gold Company, will put on a 50-horse power boiler, and a hoist competent to see the shaft down 300 feet on a good vein opened before the water stopped work.

A contract for 800 feet has been let by Manager Spurgeon of the Cripple Creek and Gold Hill tunnel, and the tunnel will be completed to the Anchoria Leland shaft as rapidly as possible.

Richer ore than ever is now being taken in the big stope from the 315-foot level in the Mahoney lease on the Orphan Belle.

At the Moon-Anchor during last month the mine has output from the big chute in the 400-foot level about 600 tons of ore. Practically all the mill ore taken from the mine last month has been stored for future treatment by the new mill planned to be built at Colorado City by officers of the Moon-Anchor, Anchoria-Leland and other properties. The level run at 500 feet has reached the ore chute, and in all probability the output will be steadily increased.

Nelson & Co. report a new strike in the Ironmaster, located on the southeast portion of Gold hill. In a shallow working a 15-inch streak of ore has been opened.

A good body of shipping ore was opened in the Reform Fraction on Bull hill by W. R. Phelps, in a shaft 170 feet deep. The ore shows in the bottom 3 feet wide and gives average assays of $60 a ton.

Two shifts using air drills are now being worked by James Doyle in prosecuting development work on the St. Patrick, in which he recently became interested.

In Saw Pit the Philadelphia, Commercial, Lizzie G. and Belle Champion are all steady producers now, and it will not be long until the Little Annie and Iron Cap will be placed in the same category.

A new company was recently organized by Milwaukee, Wis., parties, under the title of the Saw Pit Mining and Milling Company, who have put half a dozen men at work on the Arrow tunnel, on Willow creek.

On Mount Wilson the Tam O'Shanter is being worked under lease by C. M. Maddy and James McKuen, who are taking out some fine ore. They are working about twenty men.

The Silver Pick is working about thirty men. Some splendid ore is being taken out and lots of development work is under way.

The Special Session on Mount Wilson is being worked by the owners, McCullough & Bates, with eight to ten men, and are shipping ore steadily.

The Nancy Hanks, one of the best producers in the camp, which has a 30-foot body of good-grade ore, may soon get out from the meshes of the law courts and be opened up.

The Little Annie is in splendid working condition. A 580-foot tunnel has been driven in the hill, and from an upraise 60 feet some fine rock has been taken which assayed $14 gold, and now the management are sinking on the vein from the tunnel for contact, and have $7 gold ore and plenty of it.

At Idaho Springs the Newhouse tunnel has struck another lode in Seaton mountain. Within three months' time 1000 men could be placed at work on the lodes already cut, but it is known that none of this work will be done until one air connection can be put through to the surface.

Moscript, Finucan and others of the Idaho Springs pool have made a new strike in the Gold Medal.

A shipment of ore from Alma lately showed a decided increase. The shippers were: Hock Hocking, seven cars; London, to smelters and mill, eleven cars; New York, four cars; K. P., two cars; Moose, two cars; Champaign, one car; Ling, one car. Total, twenty-eight cars.

The Hale Mining and Milling Company, owners of the Hock Hocking mine, have taken up and put in place a new 75-horse power boiler to supply additional power for hoisting ore and pumping. This company have secured a tunnel site and will have a force of men driving a tunnel to cut the ore bodies at greater depth and also drain the mine.

The Bachelor, Wedge, Khedive, Pony Express and other mines in the Paquin district are making a splendid showing this season, and in consequence Ouray is shipping more ore than ever before in its history.

The Jenny Lind is about to be opened by Dr. Johnson of Montrose. The prospects bid fair to place the mine among the list of shippers.

A contract has been let for the working of the Grizzly Bear dump, and the output will be hauled to the new Fowler smelter.

The English syndicate has every reason to be gratified with the investment in the Guston, as the recent strike developed the largest body of high-grade ore ever known in the history of the property.

The Fourth of July has developed a good grade of copper, and the output will be hauled to the new smelter. The Poughkeepsie gulch district seems to abound in rich streaks of this mineral.

Denver parties have leased the All Lot mine, and operations will be resumed in the near future. In former years this mine produced many thousands of dollars.

The Humboldt, on Mount Sneffels, the property of the Old Dominion Mining Company of Richmond, Va., has reopened. It consists of the Humboldt, Sailors Fortune and Tom Paine lodes—4000 feet on the vein, a great true fissure extending for miles, and upon which more than 1000 men have been employed at one time. The Humboldt is 12,700 feet above sea level.

UTAH.

Salt Lake *Tribune*: The management of the Geyser-Marion has decided to increase its output, and to that end the Marion mill will be put in operation. The plant has a capacity of fifty tons a day. The capacity of the Geyser mill, which was in closer communication with the ore bodies, for some time has had an average capacity of 125 tons a day.

The directors of the Bullion-Beck have decided to add pans and settlers to their mill and to make its operation as nearly as possible like that at the Eureka Hill's plant, where excellent results are being accomplished. It is understood that with the plain principle of concentration the loss of a great deal of chlorides was sustained, and examination has convinced the management that this can be overcome and the percentage of metal saved considerably improved.

At the Eureka Hill the management is putting through eighteen tons a day in addition to the shipments of high-grade direct to the market.

At the Uncle Sam, in the workings is a 12-foot breast of ore which shows a valuation of from thirty to forty ounces of silver, 60 per cent lead and $6 gold. Of this an average of 120 tons a week are being marketed.

At Park City the general tone in mining circles is somewhat more hopeful than for some time. There are fewer idle men in camp than formerly which is partly due to some men leaving and others getting out in the hills, and the business tone is somewhat better, notwithstanding the cry of dull times in the diggings. Park City is to-day affording employment for over 1200 men.

As soon as the new Ellis machinery is in place, the Anchor concentrator will start up.

The Daly people have been drifting south on the 1200 level for some time, and last week after passing through a vein was encountered, and yesterday another and probably richer vein was encountered.

The Ophir Hill Mining Company will start up neither mine nor mill the present season, the management offering in explanation the low prices of lead and silver. The production of the property last year amounted to 6000 tons, while steady employment was furnished for about thirty-five persons.

Digging on the Homestake at Silver City has been renewed and the shaft will be put to a depth of 500 feet.

Bingham *Bulletin*: Whenever the great mines of Bingham decide on the right process for economically treating their ores, and can thus throw off their dependence on the combines which threaten them with ruin, the camp will emerge into an area of prosperity unknown in its former history. Its development is hardly begun, yet right now it is capable of producing 1000 tons daily of what ought to be pay ore.

Newman, Grandroot and partners have obtained a two years' lease on the old Thrush mine, next south of and said to be on the same vein as the Tiewaukee. Twenty years ago it produced ore which was shipped to Sacramento and sold for over $100 a sack.

Another shipment of seventy-five tons has been made from the Giant Chief. This increases the total of shipments since the strike to something over 200 tons.

Notwithstanding the Old Jordan mill has slowed down its output during the past two weeks, it having been making experimental runs on some of the old dumps, the amount of ore marketed from the Old Jordan and Galena mines in June will compare favorably with the tonnage of May.

Tintic *Miner*: The board of directors of the Sunbeam Consolidated Mining Company have decided to recommence operations on their properties on the 13th of July.

N. N. Brown is continuing the development of the Bertha mine in West Tintic, and is taking out some first-class shipping ore.

Mercur *Mercury*: The discovery of the second or lower vein in the Gold Dust mine proves to be of much importance and will add greatly to the value of the ground. The company will lease the Marion mill for a trial run, and intends to build its own mill.

From the Sacramento good reports are received. The mill is grinding steadily and treating about ninety-four tons of ore daily.

Tribune: The Mammoth mill will resume soon. The mill is capable of handling about 2000 tons per month, and is expected to pay all expenses of the mine, while the crude ore provides the dividends.

Salt Lake *Tribune*: It is understood that the Dalton & Lark have effected arrangements for the erection of a roasting plant, and after thirty days the company will be marketing its product in the form of a matte, instead of the crude which is now going out. The Dalton & Lark is in possession of an enormous amount of ore, and, by converting it into a matte, the profits should be increased at least 30 per cent.

A British syndicate has leased and bonded the Sulphides, Richman and Ruby claims for $25,000, and have commenced a 1000-foot tunnel. These claims belong to Clark Bros., Sullivan and Lynch.

The Creole mine is working two shifts, and continues to improve. They have a 5-foot body of ore.

J. B. Smithson with a force of men is sinking on his Hidden Treasure, and has a 4-foot vein of quartz.

Park *Record*: Weber & Kearns have their concentrating plant at the Silver King in working order, and it is now turning out about 1000 tons of concentrates per month, a force of forty-five men being employed in its operation.

The Putnam company is employing six men; the shaft is down 180 feet, from the bottom of which they are crosscutting for the ledge.

The Daily-West is closed down. The first of the month the last man working underground was laid off. Inquiry at headquarters elicited no information as to when operations would be resumed at this great property.

ARIZONA.

Republican: The Reward copper mine, southwest of Casa Grande in Pinal county, will shortly be placed among the producing mines. It has been lying idle for a number of years on account of dissensions among the people owning it. Last week ten men left for the mine to do the preliminary work preparatory to starting the mine and smelter.

Journal-Miner: The Sun Dance company has its mill running now full blast and is turning out five tons of concentrates per day.

On the King of Arizona Mining company's property the stamps are pounding away a good portion of the time. Within the next few days the contractors expect to be able to keep the mill going steadily night and day.

At Santa Maria the Waters Gold company is pushing work in the Waters and Sunset mines, and a contract will soon be let for extensive development on the Gold Standard, recently purchased by this same company from D. Thorne. Cyanide tanks have been ordered for the Waters mine, and as soon as the proper appliances can be put in place, the 20-stamp mill now on the property will be put in operation.

At Cherry Creek the Etta put on a night shift of five men last week to sink an 80-foot shaft. H. Bardshear is working twelve men on the Chicago Gold Mining and Reduction Company's B. S. B. mine, and is taking out pay rock.

The Gold Leaf has now 100 tons on the dump ready for his turn at the mill.

The Gold Ring is being worked steadily and the mill on the river has all the ore it can handle for some time to come.

L. A. Davies, General Manager of the Sun Dance Gold Mining Company, has just finished and is running a combination mill, with a 60-ton daily capacity and five 850-lb. stamps, with a plate capacity of fifteen tons per twenty-four hours.

LOWER CALIFORNIA

Lower Californian: Work on the Providencia mine at Jacalitos is being pushed and a quantity of good grade ore is in sight.

Don Emiliano Ibarra at his camp at El Burro is working four or five mines and is down 100 feet in each of them.

A power drill will be shipped to Alamo for the Aurora mine.

A great deal of prospecting is going on round Jacalitos and El Burro and several good prospects have been found.

A full force of men is at work again on the Fortuna mine at Agua Dulce.

Scientific Progress.

Advance of Scientific Knowledge.

Science has conferred one great benefit on mankind. It has supplied us with new senses. We can now see the invisible, hear the inaudible, and feel the intangible. We know that the universe is filled with a homogeneous continuous elastic medium which transmits heat, light, electricity, and other forms of energy from one point of space to another without loss. All attempts to "invent" a perfect ether have proved beyond the mental powers of the highest intellects. We must be content with the knowledge of the fact that it transmits all forms of energy in definite waves and with a known velocity, that it is perfect of its kind, but that it still remains as inscrutable as gravity or life itself. The wave differs from a wave of light only in its length or in its frequency. Electro-magnetic waves vary from units per second in long submarine cables to millions per second when excited by Hertz's method. Light waves vary per second between 400 billions in the red to 800 billions in the violet, and electric waves differ from them in no other respect. They are reflected, refracted and polarized, they are subject to interference, and they move through the ether in straight lines with the same velocity, viz., 186,400 miles per second—a number easily recalled when we remember that it was in the year 1864 that Maxwell made his famous discovery of the identity of light and electric waves. Any disturbance of the ether must originate with some disturbance of matter. An explosion, cyclone, or vibratory motion may occur in the atmosphere of the sun. A disturbance or wave is impressed on the ether. It is propagated in straight lines through space. It falls on Jupiter, Venus, the Earth; and when met with in its course, any machine, human or mechanical, capable of responding to its undulations indicates its presence. Thus the eye supplies the sensation of light, the skin is sensible to heat, the galvanometer indicates electricity, the magnetometer indicates disturbances in the earth's magnetic field. One of the greatest scientific achievements of our generation is the generalization of Clerk-Maxwell that all these disturbances are of precisely the same kind, and that they differ only in degree. Light is an electro-magnetic phenomenon; and electricity in its progress through space follows the laws of optics. Hertz proved this experimentally.

A New "Gold Process."

E. C. Brice attracts some present attention by his alleged discovery of what enthusiasts through the centuries have claimed could be done—the manufacture of gold and silver at will. Unlike other discoveries in that line Brice frankly gives the formula for making gold and silver. Here it is:

"Into a crucible, graphite preferred, place at the bottom a layer of carbon; upon this a layer of sulphur; upon this a layer of iron—preferably sheet iron—and upon this a layer of antimony—preferably Cookson's commercial antimony—the several layers preferably filling the crucible, which is then closed as tightly as possible with a cover and carefully luted with fire clay and wired down. The crucible thus filled is placed in a furnace and subjected to a direct heat, preferably a white heat, so that the crucible shall be heated to a white heat and the contents thoroughly heated, and the metals and sulphur fused together.

"The exact amount of each ingredient placed in the crucible is not at all essential, as the ratios may vary, but it has been found in practice that the following formula gives beneficial results and produces the desired result:

First layer of carbon	1 part
Sulphur	10 parts
Second layer of carbon.....	1 part
Layer of iron.....	2 parts
Layer of antimony.....	15 parts

"This double sulphite of antimony and iron may be treated in any way known to metallurgists for obtaining gold and silver. I prefer to scorify and cupel in the ordinary manner."

He says this can be tested in almost any laboratory fitted with an ordinary muffle furnace with a blast.

Further information is not vouchsafed, an obscure intimation being to the effect that while this will "create" gold or silver, his secret lies in about twenty subsequent manipulations necessary to produce the precious metals on a profitable commercial basis.

Of course Brice has his believers. All charlatans have. Since the rejection of his proposition by the Secretary of the Treasury, the inventor threatens to sell the secret to the British Government.

PROF. A. E. VERRILL in the *American Journal of Science*, writes of the color that fish assume while asleep. In most cases the change consists in an intensification of the colors. The markings have a darker appearance, and such modification is of a nature to better conceal the animal and render it less visible during the night. In certain of the species observed by Prof. Verrill the changes were more complicated. For example, the *stenotomus chrysops* while awake and in a state of activity was silvery white, with iridescent plays of color. At night it was of a dark bronze color, and from this ground stood out six transverse black bands. If it chanced to be awakened from its sleep at night, in an aquarium, by the sudden turning on of the gas, so that the light was bright, the color was instantly modified, and the normal tints of the awakened animal exhibited themselves immediately. Here again the protective role of the coloration of the sleeping state is evident, since the animal sleeps among algæ and the black bands are confused with the thalli and fronds, while the bronze color closely resembles the greenish yellow color common to many seaweeds.

CONCERNING the Polar basin, where this summer the explorers are again heading, Sir George Nares says that it is a locked-up bay continuing out of the narrowed Atlantic channel, with a warm stream of water constantly pouring into it between Spitzbergen and Norway, and a cold, icy one as constantly running out between Spitzbergen and Greenland, and also through the narrow straits between Greenland and America, the first conveying an enormous source of heat toward the north, the latter causing the intense cold of Canada and that on the east side of Greenland and North America.

IT IS probable that the depth of soil all over the world does not average more than 30 feet. But call it 50 feet, that would be less than one-hundredth part of a mile. As the globe is 8000 miles in diameter, the soil surface on it would be only one part in 800,000 in depth. It must be a clean face that does not show more dirt on it than mother earth has proportionately to her greater bulk. Yet from this thin strata of earth, with rock and molten fires beneath, all the possibilities of human life, progress and civilization are based.

FOR three years hundreds of workmen have been living in compressed air, during the construction of the Blackwall tunnel, each carrying a hundred weight of air to every square inch of his body, while people on the surface bear but fifteen pounds to the square inch. A feeling of exhilaration, amounting almost to intoxication, is produced at times. A cigar in this atmosphere burns out with a rapidity of a cigarette.

THE daily papers report that F. W. Christian has returned to Sydney, N. S. W., after two years spent in exploration in the South Sea Islands, having discovered ancient records, hand work, and weapons that prove that the Asiatic races traded in the islands, and that the ancient Chinese immigrated and colonized there and thus reached Central America.

Electrical Progress.

Tesla's Wireless Telegrams.

Experiments have been made attempting to prove the possibilities, but it has remained for Nikola Tesla to advance a theory, and experimentally prove it, that wireless communication is a possibility, and a by no means distant possibility. Indeed, after six years of careful and conscientious work, Mr. Tesla has arrived at a stage where some insight into the future is possible. He is averse to explaining all details of his invention, but allows it to be understood that he avails himself of what, for the present, may be termed the electrostatic equilibrium; that if this be disturbed at any point on the earth, the disturbance can with proper apparatus be distinguished at a distant point, and thus the means of signaling and reading signals becomes practicable once the required concrete instruments are available. Some years ago Mr. Tesla announced his belief in the possibilities, but he did so only after having satisfied himself by actual tests of apparatus designed by him. Much work had yet to be done, and he has since then given close attention and study to the problem.

Details are not yet available, and we now can merely chronicle Mr. Tesla's statement that he has really accomplished wireless communication over reasonably long distances with small expenditure of energy, and has only to perfect apparatus to go to any extent. Morse's forty-mile experiment in the old days was on a far less certain basis than the wireless possibilities of today.

Tesla's work with high frequency and high-potential currents has been notable. As long ago as 1891 he foretold the present results, both as to vacuum tube lighting and intercommunication without wires. The former had in his hands assumed a condition capable of a public demonstration of the phenomena of the electrostatic molecular forces. Numberless experiments were carried out, and from what then was a startling frequency of 10,000 per second, Mr. Tesla has advanced to what now is moderate work at 2,000,000 *oscillations per second*. Such almost inconceivable results are plainly out of all possible reach by any mechanical rotation of a commutator. And so long as efficiency of lighting is, as Mr. Tesla observes, dependent upon extremely high frequency, it would seem his efforts are in the one and only direction likely, in vacuum tube lighting, to lead to success. Success, according to Mr. Tesla, is already assured, but he will not come before the public until every detail of a practicable and commercial system is complete, and the day for such a consummation, he now states, is near at hand.—Electrical Review.

Copper and the Third Rail.

A railroad man thinks that within ten or twelve years not one of the roads now running out of Boston will issue, for the use of their patrons, local timetables. "It will not be necessary," he said; "by that time I firmly believe that all the roads will be operating their suburban service by means of the third rail electric system, and that will mean a reorganization of existing schedules and an entire readjustment of suburban transportation methods. I mean by that, that they will not only be forced to adopt the third rail system by stress of traction competition, which is ever increasing and becoming more powerful, but that the science of passenger transportation will have reached that stage by the natural and always logical progress of advancement. The third rail is the coming power. The adoption of the third rail system by the various systems of the country is, I think, an eventuality that requires only the passage of a certain length of time to become an actuality. It will mean a great deal to the copper market. The gradual adoption of the system will mean a heavily increased demand for copper, the possibilities of which are much greater than are at first sight apparent. When it is remembered that every foot of third rail track laid requires, at the lowest estimate, one pound of copper, you can figure out for yourself what an enormous demand will be created for the metal. Every mile of the third rail track that is laid requires five tons of copper. Put two and two together, and try to figure out the probable result that the adoption of the new method means to the copper metal market."

Electro-Capillary Light.

Herr O. Schutt of Jena describes a new electric discharge phenomenon, which he terms electro-capillary light. When the discharge of an induction coil is sent through a narrow capillary tube of about 0.05 millimeter in diameter, provided with aluminum or copper electrodes and filled with air under ordinary pressures, an intense luminosity of the thread of air is obtained —a luminosity which is intrinsically far superior to that of the arc, and would form an exceedingly powerful source of light if it could be made continuous. The narrow capillaries deteriorated rapidly, roughening inside, and were blown into a series of spherical enlargements. Wider tubes gave less light, but were much more permanent. At the same time the bright lines in the continuous spectrum in the original light became more prominent. At pressure above one atmosphere the phenomena were nearly the same, but the sparks passed with greater difficulty. At low pressures the light became less intense, the continuous spectrum faded, and the bright lines shone out more distinctly. The kind of glass is immaterial. It is stated that the tubes may be made 20 centimeters long, and make splendid line sources.

THE effect of temperature upon the magnetic and electric properties of iron as investigated by D. K. Morris relates to the measurement of the magnetic permeability, hysteresis, and electrical resistance of iron, simultaneously, at different temperatures. The specimens are formed into annular rings, made from iron strip. The strip is first lapped round with asbestos paper and mica, and then wound upon itself to the required thickness. A platinum wire is included in the mica lappings, for thermometrical purposes. Upon each annular ring are the following windings: (1) A primary magnetizing coil; (2) a secondary coil connected to a ballastic galvanometer; (3) an electrical heating coil. Further, the iron strip is itself connected to a Wheatstone's bridge, for resistance measurements. The coil can be heated to 1050° Cent. At the higher temperatures the surrounding air has to be freed from oxygen; this is done by enclosing the coil in a suitable vessel, and exhausting with an air-pump. When most of the air has thus been removed the residual oxygen is absorbed by an electrically heated iron wire. Curves are drawn representing the changes of permeability at the different temperatures; and at the same temperatures the corresponding hysteresis loops are plotted. The hysteresis diminishes with temperature; it nearly vanishes at about 764° Cent.

"SIGNALING Through Space Without Wires" was the subject of a recent paper read before an English scientific body by W. H. Preece. The author described the method he himself had worked out of sending signals from one place to another without intervening wires. In this system, which made use of electro-magnetic waves of low frequency, two parallel circuits were established, one on each side of a channel or bank of a river, each circuit becoming successively the primary or secondary of an induction system according to the direction in which signals were to be sent. Strong alternating currents were transmitted in the first circuit, so as to form signals in the Morse code. The effects of the rise and fall of these currents passed

as electro-magnetic waves through the intervening space, and if the secondary circuit was so situated as to be washed by these ethereal waves their energy was transformed into secondary currents, which could be made to affect a telephone. This system was successfully used in 1895 to telegraph across the Sound of Mull when the submarine cable had broken down. With reference to the distance to which it was possible to signal in this way, the lecturer mentioned that the curious law had worked itself out that the length of the two parallel circuits must be equal to the distance between them.

SOME of the MINING AND SCIENTIFIC PRESS readers may not exactly agree that the following is "electrical progress," but it certainly shows a perverted aptitude on the part of burglars who resorted to a novel scheme to open a bank safe at Chagrin Falls, Ohio, one night last week. They entered the bank of Rogers & Son some time in the early evening. They had previously attached a wire to a trolley line of the electric railway. The wire was run through an alley, over a transom to the safe. Another wire attached to the rail of the street car track was brought into the bank. At the ends of these wires were carbon points. With these carbons an attempt was made with the arc lights thus formed to melt the knob of the combination. The experiment worked all right and the knob had been nearly melted away when the current was shut off shortly after midnight. The burglars then gave up the task. The job was planned scientifically.

THE electrolytic refining of copper, according to a writer in the *Chemiker Zeitung*, is now greatly facilitated by the use of compressed air, following the systems of C. & H. Borchers and Siemens & Halske. The air is introduced under pressure through lead pipes, terminating in glass jets near the bottom of the vats. By this means arsenic and iron are both precipitated (as arseniate of iron), the liquid is circulated, and the current density may be safely increased from 30 to 100 amperes. When the electrolyte is saturated with bismuth and antimony taken up from the anode, it should be removed and treated with copper oxide or basic salts. After filtration and acidification the liquid can be used again.

THERE is described in *La Nature* a new method of preserving meats by immersion in a 30 per cent solution of salt through which a continuous current of electricity is being passed. In from ten to twenty hours the curing is completed, when the meat is withdrawn and set out to dry. For 3000 liters (2640 quarts), in which 1000 kilos (2205 pounds) of meat may be immersed, a current of 100 amperes and 8 volts is sufficient. The electrodes must be of platinum, for when other metals are employed noxious salts may be formed by the current. If the process proves a success, it will be possible effectively to prevent the putrefaction of meats.

LIGHTING railway cars by electricity is being practically tested by the Pullman company. A plain geared wheel attached to the car axle drives a pinion on the shaft of a 1 H. P. dynamo on the car truck, the current passed through a storage battery, the light thus made brilliant and uniform, both while the train is running and when it is standing still. Each car is independently provided with its generating and illuminating apparatus. The apparatus weighs about 500 pounds, and is automatic.

Electricity reports Harry L. Rood, electrician of the New Albany (Ind.) Light, Heat and Power Company, through whom 4000 volts of electricity passed a few weeks ago, as convalescent. Rood is the only living man in the world who has had 4000 volts of electricity pass through him. Two holes were burned in his back by the current, and one rib and part of a lung can be seen. His case has attracted considerable attention, and he has received communications asking for facts from several scientists.

THE spectacle of a fountain of water springing from the top of an electric tramway pole has lately been witnessed in Detroit. When a gang of men were set to work to discover the cause of the phenomenon, they came to a water pipe which ran beneath the pole. The pipe had been eaten through by electrolysis, and the water burst through, entered the hollow iron trolley pipe, and, having nowhere else to go, came out at the top. It is believed that such a demonstration of the necessity of looking out for bad work or accident in the insulation of a trolly line is unique.

THE Central Underground Railway of London is to be equipped with electric motive power, the apparatus for which will be manufactured in this country. A cablegram states that a contract has been signed in London with the Underground road by E. W. Rice Jr., the representative of the General Electric Company. The amount of first installation of the power under the contract is about $700,000.

Mechanical Progress.

A Test of Oils.

A good test of oil is to place single drops of different oils in line upon a piece of plate glass about 2 feet to 2 feet 6 inches long, one end being raised about 6 inches to 8 inches to form an inclined plane. This test should be conducted in a room where there is little or no dust. The drops of oil start from the top of the inclined plane upon a race with each other. The first day sperm oil will be found in the rear, but after a time it will overtake the others, and be found in motion even after some others have dried up. An oil having a light body runs quickly and dries quickly, but an oil that has both a body and a free flow will readily be detected by this test. An oil may have a good body, and yet tend to gum badly, which quality will also be easily detected upon the glass. A good test for the presence of acids is to put small quantities of oils in copper dishes, which are easily made by depressing bits of sheet copper with a round-faced hammer. If acid is present it will attack the copper and produce verdigris. As a result of experiments carefully made and extended over a year, it was found that iron was least affected by seal oil, and most by tallow oil when it is not deacidized. Brass is not affected by rape oil, least by seal oil, and most by olive oil. Mineral lubricating oil has no action on zinc. It was found that mineral lubricating oil has, on the whole, the least action on the metals experimented with, and sperm oil the most. For the journals of heavy machinery either rape or sperm oil, in admixture with mineral oil, is the best to use, as they have the least effect on brass and iron, which two metals generally constitute the bearing surfaces of all engines.

Nickel Steel Tests.

Some recent tests made by the British Admiralty show some advantages over ordinary steel. For twelve months plates of nickel steel, ordinary mild steel, and wrought iron were immersed in the sea, and the loss of weight in that time due to corrosion worked out at 1.36, 1.72 and 1.89 per cent, respectively. A number of bars of nickel steel and carbon steel, 1½ inches square and 18 inches long, were some time ago placed on supports 10 inches apart, and a weight of 1000 pounds allowed to fall on them from a height of 3 feet, the bars being reversed after each blow. The carbon steel was fractured after five blows and broken after twelve, while it required seven blows to fracture the nickel steel and thirty-five to break it —an increase of 147 per cent. It is claimed by engineers acquainted with the qualities of this material that if it should be adopted for cylindrical boilers that have very thick shells, such as are used in large steam vessels, a saving of 25 per cent could be effected in weight.

Ancient Arizona Engineering.

A correspondent of the Chicago *Journal of Commerce*, writing of Arizona, says that he saw in the Salt river valley a steam dredging scow, such as is used in deepening rivers and harbors for navigation, voyaging slowly and steadily through a wide strip of arid desert. It was started landward from Salt river and was excavating its own channel ahead, the river waters following and floating it as it advanced. But the work done was not, in fact, the making of a new channel, but the digging out of an old one, the irrigating canal made by a civilized people that lived and flourished and departed before recorded American history began. That there was a time when this wide valley, now being again redeemed to man, was a garden of plenty, teeming with inhabitants, is shown by the extensive and regular system of broad canals leading from the river, through which water for irrigating was conveyed out upon the cultivated lands. These canals, though choked for centuries with drifting sand and earth, still are plainly indicated on the face of the ground, and so skillfully were they planned and built that modern engineering science applied to irrigation can do no better than retrace their course and restore them. What race laid out the canals and built the towns whose ruins are strung along the valley is a question not yet settled by archæologists. Aztecs or Toltecs, or each nation in turn, probably tarried here in their centuries long migrations southward to the valley of Mexico, and the ruins may be of an older people than either of these.

A New Pyrometer.

The increasing use of high temperatures has caused considerable advance in forms of pyrometers. *La Revue Technique* describes the last, that of M. Latarche:

Briefly, the apparatus depends upon the radiant heat emitted by the furnace or other source of heat to be measured, and consists of two thermometers so placed that the rays of heat may impinge upon the bulbs from such a distance that the actual temperatures indicated will fall within the limits of the ordinary scale. The bulb of one thermometer is silvered, and that of the other is blackened; hence there is a marked difference in their respective heat-absorbing capacities, and, therefore, the temperatures which they indicate will not be the same. From this difference the actual temperature of the radiating source of heat may be computed, the principle being analogous to the measurement of a distance by observing two angles at the extremities of a base of known length, the base in this case being the difference in the readings of the two thermometers. A third thermometer, the bulb of which is immersed in water so as to be screened from the action of the radiant heat, is used to give the actual temperature of the surrounding air, and, when a given set of instruments has once been calibrated, the scales may be so graduated that the furnace temperatures may be read off directly.

Riveting with Compressed Air.

The master mechanic of the Santa Fe, speaking of the use of compressed air in their shops, says that by the use of a stationary riveting machine three men can drive 2000 rivets per day of ten hours, at a cost of $4.75, as compared with 200 rivets per day at a cost of $7 by hand labor; the truck riveters, machine being operated by two laborers at a total cost of $3 per day, drive 3000 rivets, as compared with 175 rivets driven by hand labor by three men in a day at a cost of $6; the staybolt breaker makes an average saving of $8 a day, and the tank riveter an average saving of $10 a day. The mud-ring riveters will drive as many rivets as can be handed to them, and will make a saving of $12 to $15 a day for that class of work. Not only does it make a great saving, but it insures every rivet hole being entirely filled and insures tight work, while with hand-driven rivets in mud-rings a large percentage of them invariably leak and have to be caulked and fullered up; the staybolt cutter will do the work of fifteen men.

Sound as a Measurer.

The principle of the reflection of sound is very ingeniously employed in locating the position of inaccessible obstructions in the pipes of the pneumatic tube service in some of the large cities of Europe. When a pipe is found to be constricted, a diaphragm, so thin that it will instantly vibrate under the force of a sound wave, is attached to the end of the pipe, and connected electrically with a chronograph in such a manner that when the diaphragm vibrates it will close the electric circuit and register on the chronograph. A pistol loaded with blank cartridge is then fired into the tube through an opening just below where the diaphragm is placed. When the shot is fired the sound wave causes the diaphragm to vibrate and registers the exact time on the chronograph. The sound wave will travel along the tube until it meets the obstruction, and will then be reflected back. When this reflected sound, or echo, returns to the end of the tube it causes the diaphragm to vibrate again and make another registration on the chronograph which will thus correctly indicate the exact interval of time required for the sound to travel from the end of the tube and back again.

THE wheelbarrow affords one of the chief means of travel and transport in China, especially in the northern part of the empire and throughout the Great Plain. The Chinese form is a decided improvement on the types used in western countries, for it is so constructed that the load, which sometimes is very great in bulk and weight, is carried over the wheel, and not between it and the man who propels it. The charge for carrying an average load is about 1 shilling and 5 pence per mile, but varies according to the load and the state of the road to be traveled over. The wheelbarrow has seating accommodation for four people, two on each side, and the fare for four people is 2½ pence per mile. On the Great Plain wheelbarrows are occasionally seen with a sail set, when a fair wind proves to be a great help to the trundling of the barrow over a level way.

A NEW safety igniter for mine shots, devised by Oberbergrat Ludwig Jaroljmek, depends upon the heat given out by quicklime when slaked, which brings into action a rhodanite-potassium igniter, the latter in turn causing the explosion of the detonator proper. At the same time the swelling lime cartridge forms an effectual tamping in the hole, thus preventing any issue of flame. The ignition, which is effected by the injection of water, ensues after a lapse of three minutes at least, and fifteen minutes at the outside. These detonators are put up in lime cartridges, covered with tin-foil; and the cartridges with the detonators and igniters are enclosed in a woven tissue.

ANOTHER new bridge is to span Niagara, taking the place of the upper suspension bridge and to be finished July 1, 1898. When completed the Canadian and American Niagaras will be connected by two fine steel arch structures. The bridge designed to replace the upper suspension bridge will be built on the parabolic principle.

A FEW years ago the idea of loading a ship with 2300 tons of flour in twenty-four hours by means of two small motors would have been looked upon as absurd. This was done recently in Tacoma.

Coast Industrial Notes.

—It is calculated that the oil output of southern California will be 2,000,000 barrels this year.

—The Secretary of the Navy will this year expend large sums in the repair of war ships at Mare Island.

—E. E. Souther, president of the Souther Iron Co., St Louis, Mo., is going to build a $100,000 iron foundry at San Luis Potosi, Mexico.

—California is in general well treated in the tariff bill which passed the Senate by a vote of thirty-eight to twenty-eight last Wednesday and now goes to the house for conference.

—Officials of the Santa Fe are investigating a scheme for a railroad to the Grand Canyon of the Colorado, the starting point to be Williams, on the Santa Fe Pacific. Besides tourist travel, it would draw a revenue from the new copper fields.

—During the year since the bonds were voted, the Southern California Mountain Water Company, to supply the city of San Diego, Cal., has expended between $250,000 and $300,000 on constructing its system. About $100,000 has been spent for machinery.

—Commissioner Hermann of the General Land Office has formulated rules for the government of the forest reserves, which have been approved by the Secretary of the Interior. Prospecting, locating and developing the mineral resources of forest reserves are permitted; water for domestic, mining, milling and irrigation purposes is allowed; reserves for irrigating canals and ditches are authorized, and the right of way across flumes and reservoirs is permitted. Owners of mining locations are authorized to fell and remove from their mining claims any timber growing thereon for actual mining purposes. The free use of timber is allowed to bona fide settlers, miners, residents and prospectors for mineral for firewood, fencing, buildings, etc. The sale of timber from reserves will be permitted in limited quantities for the purpose of preserving living and growing timber and permitting the younger growth of timber on the reservation.

—Fourteen bids for the construction of fortifications at Marrowstone point, across Port Townsend bay, Wash., were opened last week by Capt. H. Taylor, U. S. Corps of Engineers. The fortifications and the ordnance for Marrowstone Point, Admiralty Head and Point Wilson will require an expenditure of $7,000,000, and it is estimated that the work will require ten years to complete. The lowest figure put in for the contract was the Pacific Bridge Company's, $163,453.50; next H. C. Henry, Seattle, $166,056.50; third P. N. Coyne, Port Townsend, $167,415.50. There were thirty-two separate items in the bids submitted, and in the case of the Pacific Bridge Company, which submitted the lowest figures, they were as follows, in relation to quantities: Clearing, twenty-eight acres, $1400; excavation, 178,400 cubic yards, $44,600; concrete, No. 1, 500 cubic yards, $2975; concrete, No. 2, 2400 cubic yards, $11,616; concrete, No. 3, 15,900 cubic yards, $68,688; granolithic surfacing, 4500 square yards, $1800; whitewashing, 400 squares of 100 feet, $100; broken stone for blind drains, 150 cubic yards, $150; large rock, 750 tons, $1612.50; steel beams, etc., 154,000 pounds, $4620; cast-iron drain pipe, eight-inch, 1150 linear feet, $690; cast-iron drain pipe, six-inch, 460 linear feet, $207; tile drain pipe, six-inch, 1500 linear feet, $180; galvanized wrought-iron pipe, two and a half inch, 560 linear feet, $140; galvanized wrought-iron pipe, two-inch, 400 linear feet, $80; galvanized wrought-iron pipe, one and a half inch, 3400 linear feet, $510; cast-iron manholes, gratings, etc., 3500 pounds, $140; doors, steel double leaf, 6x8 feet, six, $390; doors, steel double leaf, 4x8 feet, six, $270; doors, steel single leaf, 4x8 feet, twenty-four, $1008; doors, steel single leaf, 3x8 feet, twenty, $700; cranes, twelve, $1500; lifts, double, twelve, $9480; trolley track, 19,000 pounds, $1995; trolleys, twenty-four, $1680; steel anchor bolts, 8400 pounds, $504; cast-iron anchor plates, 4200 pounds, $168; miscellaneous iron, 1000 pounds, $50; asphalting, 1700 square yards, $3230; piling, 11,000 linear feet, $1650; lumber, 80,000 feet B. M., $1040; iron, 7000 pounds, $280. Total, $163,453.50. All of the abstracts and bids will be forwarded to W. P. Craighill, chief engineer of the army, at Washington.

Recent California Mining Incorporations.

Independent M. and D. Co., Los Angeles; F. A. Stephens, E. E. Banta, J. F. Jenkins, A. E. Carpenter, I. M. Patterson; capital stock, $125,000; subscribed, $25.

Gold Bug M. and M. Co., Los Angeles; F. E. Kearney, C. H. Hastings, C. L. Hanson, O. Rutherford, E. L. Allen; capital stock, $2,000,000; subscribed, $1,500,000.

Marcot G. M. Co., Redwood City, Cal.; J. L. Ross, P. P. Chamberlain, W. M. Barret, W. D. and J. Crowe, M. Townsend, T. H. Ramsay; capital stock, $100,000; subscribed, $40.

Del Norte M. Co., San Francisco; G. H. Fairchild, D. W. Perley, H. G. Richmond, S. E. Starrett; capital stock, $250,000, all subscribed.

Diamond Con. G. M. Co., San Francisco; J. J. Schurtz, C. E. Dugan, A. S. Wolberg, D. C. Martin, P. H. Evans; capital stock, $750,000; subscribed $35.

Recently Declared Mining Dividends.

Pennsylvania Gold Mining Company, Grass Valley, 5 cents per share; payable July 1.

Moon Anchor, Cripple Creek, $6000; payable July 1.

Personal.

CAPT. J. R. DELAMAR has returned from London and gone to Salt Lake, Utah.

E. W. BEATTIE of Helena has been confirmed as surveyor-general for Montana.

E. A. HARDY has been appointed superintendent of the Santa Ysabel mine in Tuolumne county, Cal.

R. D. GRANT has been appointed secretary and general manager of the Parrott Silver and Copper Company of Butte, Montana.

H. C. WOODROW, recently of Angels, Cal., has become interested in some Tuolumne Co. property near Sonora, which he will develop.

JNO. C. GRAY, the Oakland, Cal., mining engineer, returned this week from a lengthened sojourn in New Zealand, where he had been examining mining properties.

OTTO MEARS, president American Cyanide Gold and Silver Recovery Co., who recently bought 150,000 tons tailings in this State, is visiting Wood River district, Idaho.

MR. H. V. CROLL, superintendent of the Denver Engineering Works Co., Denver, Colo., is visiting this State on business and pleasure combined and will remain a month.

JAS. CRONAN, who recently resigned the superintendency of the Hale & Norcross, Virginia City, Nev., is in San Francisco, en route to Rossland, B C., where he has extensive mining interests.

DR. GEORGE F. BECKER of the United States Geological Survey has arrived in San Francisco and will go to Angels Camp, Calaveras county, to make an examination of the gold belt north from that point. He will be several months on the ground.

MAJOR HEUER is expected to arrive here this week to take the place in the U. S. Debris Commission so ably filled for the past three years by Capt. Cassius E. Gillette, who is transferred to Savannah, Ga. Major Heuer was one of the original members of the Commission when first organized, is thoroughly familiar with all matters pertaining thereto, and will be welcomed by many old friends and acquaintances.

DAN DE QUILLE writes the MINING AND SCIENTIFIC PRESS that he is going to West Liberty, Iowa. If every one whom that veteran writer had delighted were to contribute a penny he would start on his journey a millionaire. He enriched all save himself and for thirty years rarely touched a subject he did not adorn. For nearly a generation he has written the chronicle of the Comstock, at Virginia, Nevada, and what he wrote, whether in the ephemeral form of a fleeting newspaper paragraph or in more pretentious binding, has been copied everywhere. Long ago the coast forgot there was such a person as William Wright, and as "Dan de Quille" he has been hailed by thousands as the wit and humorist of the Comstock. He was always lavish of his literary treasures and his money—Mark Twain, his former collaborator, knows considerable about that—and his best jokes were ofttimes published by and credited to others who better understood how to advertise themselves. He takes with him the kindly remembrance of many who loved to read what he wrote and who will think the Silver State will not be the same old Nevada without him.

Book Notices.

"*Stamp Milling of Gold Ores.*" By T. A. Rickard, M. E., State Geologist of Colorado. This work will be found to be timely and of practical value to the millman. It describes the best gold milling practices in the principal districts of the world. Mr. Rickard was well prepared and equipped by experience, observation and training for the work. It is a painstaking description of the practice rather than a discussion of the chemistry and mechanics of stamp milling. The book can be understood and appreciated as well by the practical mill man as by the educated metallurgist. Much data is given as to costs in detail, life of machinery, etc., that is of special value. The designs of mills and machinery, and drawings and other illustrations add considerably to the utility of the book. Published by the Scientific Publishing Company, New York and London; price, $2.50.

Commercial Paragraphs.

THE office of the California Powder Works has been moved to the new Clark building, corner of Market and Battery streets.

THE Risdon Iron and Locomotive Works will hold its annual meeting at the company's office, Beale and Howard Sts., S. F., on the 2nd prox.

MAJOR CHAS. E. L. B. DAVIS of the U. S. Board of Engineers, room 90, Flood Building, San Francisco, will receive sealed bids for a gun emplacement near San Diego, Cal., till noon, Aug. 9, '97.

A. S. HALLIDIE has moved his office to the new Clark building, at the corner of Market and Battery streets, where a complete working model of his ropeway transportation system can be seen.

THE following are among the thirty-third annual list of graduates from the Van Der Naillen School of Engineering in this city: Mining Engineers—G. L. Gruss, Genesee, Cal.; John Andrews, Middleton, Cal.; W. B. Duesler, Globe, Ariz.; C. Maack, Petaluma, Cal.; E. Matterson, Shasta, Cal.; R. Trengove, Neuman, Cal.; R. Von Reischach, Antofogasta, Chile. Assayers—A. Price, Angels, Cal.; T. Hanmore, Alaska; A. Keiller, A. L. Kievey, Amador, Cal.; R. Caption, F. L. Fletcher, R. J. Williams, L. McCabe, Oakland; A. Evans, San Dimas, Mexico; L. A. Pellett, St. Helena, Cal.; R. Remick, Taylorville, Cal.; M. D. Allen, Globe, Ariz.; W. L. Smith, Oregon; L. E. Bailey, A. C. Hall, San Jose, Cal.; J. Macklin, Buffalo, Ariz.; C. E Allen, Eureka, Nev.; J. H. Hennessey, Randsburg, Cal.; J. W. Young, R. A. Troyen, H. Pennett, J. M. Sullivan, J. W. Curry, A. E. Hanson, C. Rosenthal, C. H. Smith, F. B. Hink, E. B. Hornerton, San Francisco.

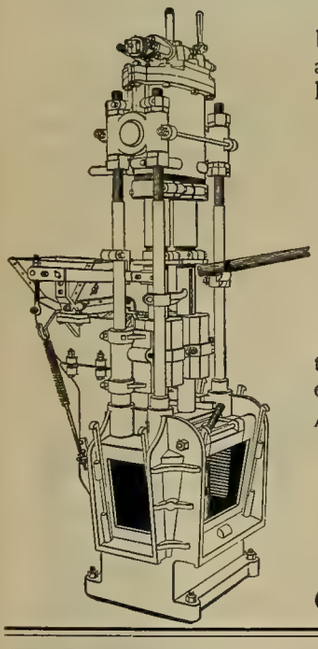
A STEAM ORE STAMP.



One of the BONANZA MINES of the Black Hills was developed by a **TREMAIN STEAM STAMP MILL**, installed last summer at a cost of about $1600. After six months' run the superintendent wrote the following letter:

HILL CITY, S. D., Feb. 2, 1897.

Gates Iron Works, 650 Elston Ave., Chicago, Ill.—GENTLEMEN: It gives me great pleasure in informing you of our success with the Tremain Steam Stamp Mill which we have been running since last July. We have been running on hard, white quartz, some of it of a flinty character and a small portion of it slightly decomposed. We average about ten tons every 24 hours through a forty-mesh screen. If our financial standing had been a little better, so we could have put in a small engine and rock crusher, I am confident we could put through 14 to 15 tons in 24 hours. The wear and tear is considerably less than an ordinary stamp mill, it all being on the shoes and dies. The last we used of these were of the aluminum steel, which are the best wearing shoes and dies I have ever seen. The parts are all well made and durable, I having failed to see any weak point about the machinery.

We use one cord of pine wood in 24 hours, and run the mill with 70 to 80 lbs. of steam.

I have followed mining in connection with milling for thirty years and have never seen its equal for convenience, durability and cheapness. To parties wishing to purchase a quartz mill I cheerfully recommend the Tremain Steam Stamp Mill for its small cost, economy in operation and complete results of working. Very truly yours, [SIGNED] JAMES C. McDONALD, Supt. St. Elmo M. & M. Co.

This Mill has the capacity of a 5-stamp gravity mill and costs less than half to install. Automatic feeder of approved design. Weight of entire Mill 3300 lbs. Made sectional for mule-back transportation.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

BUTTON FASTENERS.—C. H. Warrington, San Francisco, Cal. No. 585,142. Dated June 22, 1897. This invention relates to a device for securing buttons to garments and other like places. It consists essentially of a plate folded centrally so as to have parallel sides extending from the fold and adapted to receive the edge of the fabric to which the device is to be secured, this plate having a slot made transversely in one of the sides near the lower end thereof, a second plate extending loosely through the slot having an enlarged transverse serrated head upon its end between the sides of the first-named plate, a button or fastening having a shank fixed to the opposite end of the second plate, the button-carrying plate having a curved end which forms an elastic clamp that can fold over the bight of the first-named plate after the two have been brought parallel with each other so that the teeth or serrations in the head will engage with the fabric as it lies between the sides of the first-named plate and secure it firmly. By reversing or turning back this plate the fabric will be released and the fastening can be separated therefrom, thus being easily placed at any time at any desired point.

CONDUCTORS FOR UNDERGROUND ELECTRIC RAILWAYS.—Charles Petersen, San Francisco, Cal. No. 585,047. Dated June 22, 1897. This invention relates to a novel construction for underground conduits which are to be used in conjunction with electric railways. It consists essentially of a subway conductor formed of angle iron channels with supplemental angle iron plates fitting the inner adjacent edges and forming a slot between the channel irons, concaved arched conductors fixed beneath and within the angles upon each side of the slot, the exterior surface being coated and insulated and the interior concaved surface forming a conductor. A trolley shank extends down through the central slot and has insulated extensions fixed to it. These extensions have trolley wheels upon each end within the tube or tunnel so that these trolleys run in contact with the concaved conductors. One of these conductors may be connected with the outflowing and the other the returning current, and wires or conductors respectively connect the trolleys with the positive and negative parts of the motor upon the car.

AUTOMATIC WEDGE-SHAVING MACHINE.—Gideon L. Bigelow, San Jose, Cal. No. 585,375. Dated June 29, 1897. This invention relates to a device which is especially adapted for shaving wedges such as are used in fixing the spokes of wagons and similar vehicles, and for other purposes. It consists essentially of a base-plate, a guided slide, a lever and pitman whereby the slide is reciprocated upon the base-plate, an inclined surface adapted to receive the pieces to be shaved, a pushing block against which the ends of the pieces abut whereby they are forced forward simultaneously with the movement of the slide, side plates forming guides between which the front end of the slide is movable, with wedges to raise and depress said plate, a knife blade adjustably fitted between the side plates with its edge presented toward the reciprocating slide and the piece carried thereby so that the block is shaved to a tapering point, and a stop against which the rear end of the slide is arrested.

LOCK BEARER FOR FURNACES.—Peter Maddocks, Midway, Cal. No. 585,361. Dated June 29, 1897. This invention relates to a lock bearer for furnaces. It is designed to support the inclined tiles which are used in vertical roasting furnaces where the ore flows down over these tiles in thin sheets alternately upon opposite sides of the vertical chamber. The object of this bearer is to prevent accidents occurring from the alternate heating and cooling, and expansion and contraction of the tiles, and it consists of inclined projections from the furnace walls upon which the upper edges of the tiles are supported, and bearers with projecting lugs engaging openings made in the meeting edges of the tiles, with channels formed across the upper ends of the bearers to engage and support the edges of the oppositely inclined tiles above.

PROCESS OF AND APPARATUS FOR SUGAR MAKING.—Wilhelm Baur, New York, N. Y. No. 585,374. Dated June 29, 1897. This invention relates to the art of manufacturing sugar or other articles wherein lime, strontium and other substances are use for clarifying certain solutions and are subsequently precipitated and removed. The object of this invention is to utilize this precipitation which heretofore bas been waste substances, and this object is attained by reburning them so that they are converted into the original forms of the substances, and may be again used as in the first instance. I also obtain during the re-burning the gas necessary to precipitate the substances from their original solutions once more and thus provide a continuous process. In carrying out the invention the precipitated substances which have been used in purifying and clarifying the saccharine solution are delivered directly into a substantially closed vessel and subjected to the action of a gradually increasing heat while the substances are in agitation so that their confined carbonic acid gases are liberated, and the substances are reburned and converted into their original forms while the liberated carbonic acid gases are simultaneously withdrawn and augmented by that produced by the fuel, these gases being reused so that the process is continuous and uninterrupted. In carrying out the process I employ an apparatus consisting of a mixer, an inclined drier provided with interior rotating agitators adapted to receive the substances from the mixer, an inclined flue including a rotary kiln fitted closely thereto and communicating through a passage at one end with the drier and having a fire chamber at the other, with interior projections extending from the head or receiving end toward and terminating short of the fire chamber, and means for withdrawing the gases from the kiln.

BICYCLE SUPPORT.—R. G. Bailey, San Jose, Cal. No. 585,458. Dated June 29, 1897. The object of this invention is to provide a simple, convenient device for firmly holding bicycles in a reversed or upside down position so that they may be cleaned or any work done upon them which is more conveniently done while in this position. It consists of a flat, horizontally disposed plate having spaced concaved lugs rising from its top surface, a yoke centrally located on the plate and fulcrumed thereto; said yoke having spaced arms to embrace the upper sides of the handle bars, and an integral portion extending centrally from the arms having ratchet teeth, a pawl fulcrumed near the central extension of the yoke adapted to engage the ratchet teeth so as to lock the yoke when the arms are closed upon the handle bars and a spring whereby the yoke is disengaged from the bar.

BICYCLE DRIVING AND STEERING MECHANISM.—H. B. Trickler, Albion, Cal. No. 585,370. Dated June 29, 1897. This invention relates to certain improvements in bicycles whereby the power of the arms as well as the legs may be applied to the propulsion of the machine. It consists of a crank shaft with foot pedals, sprocket wheels upon the crank shaft and rear axle in conjunction with the main frame of the machine, a connecting driving chain, a bracket adjustable upon the steering head capable of being turned to a position either in front of or behind the post, a crank shaft journaled thereon with hand cranks by which it is revolvable, a sprocket wheel upon the hand crank shaft and a corresponding one upon the pedal crank shaft with a chain extending between the two so that a simultaneous movement of the feet and hands may apply power to drive the machine. A vertically extended curved bar has the lower end secured to the steering head, and a slotted head-piece fixed to the cap of the rider is adapted to slidably engage the upper end of this bar so that the steering may be effected by movements of the head while the hands and feet are entirely occupied in the propulsion of the machine.

DEWEY & CO., Patent Solicitors.

330 MARKET ST., SAN FRANCISCO, CAL.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us to give advice which will give inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address **DEWEY & CO., Patent Agents, 330 Market St., S. F.**

MINERS, ATTENTION!

We beg to call attention to our "RISDON HAMMERED" Shoes and Dies, which are made of a special quality of steel, are hammered and then compressed in moulds so as to give the greatest possible density.

These Shoes will outlast any other make and will not chip or cup.

We have attached a sketch showing sizes; fill in the size of your Shoes and Dies, and order a trial set.

Our prices are as low as any, and the article we offer should commend it to all mine owners and mill men.

ASPEN, COLORADO, April 8, 1897.

The Mine and Smelter Supply Co., Denver, Colo.—GENTLEMEN: Your favor of the 5th inst. at hand and noted. In regard to the Wilfley Table I wish to say that I consider it to be the best device in use to-day for concentrating fine ores; that it will save everything that a gold pan will; that it combines the clean saving of a Rittinger with the capacity of a buddle. I think that without question it will supplant in time all other devices for handling fine and slimy ores. This includes all the vanning machines and buddles.

This is higher praise than I am in the habit of giving, but I feel sure that it is deserved, and you may make any use of this that you desire. Yours very truly, [SIGNED] S. I. HALLETT.

These Tables have displaced belt tables of almost every make, as is shown by letters in our possession.

PRICE, $450.00.

Market Reports.

The Markets.

SAN FRANCISCO, July 8, 1897.

General trade shows a steady improvement. The Christian Endeavor convention has drawn large crowds to this city, among whom are numbers of merchants, miners and business men in general, many of whom have come so as to take advantage of low passenger tariff. Among the mining men one comes with the Connecticut delegation to attend the convention, and while here will investigate the gold mining industry in the interest of a moneyed syndicate at the East. This syndicate has large interests in the Black Hill mines. There are several men from other States here who will also look over the field before returning. The higher prices ruling for cereals and farm products in general are having a good effect, particularly so with the total yield proving larger than last year. In the mining districts employment is given to large increased forces of men.

In the local market money continues to work to more ease, with the banks showing a disposition to let out funds. There is an improving call for funds for crop-moving purposes; as it goes into circulation, it soon finds its way back. The disbursements in this month are in excess of last year. These disbursements cover National, State, county and municipal governments. With this money in circulation still more ease should rule in the money market. It is stated that there is a growing inquiry for good investments, which is accepted as a favorable sign. Remittances from the interior are increasing. The Eastern markets continue easy, notwithstanding a large increase in loans. The demand comes from nearly all sources as a result of improving business and enlarging speculations. The movements of money to the Central and Southern States out of New York is growing in volume. In accredited circles it is stated there will be more silver coin go out than even last year. It is said that the use of silver is increasing. European advices report general easy markets notwithstanding a freer employment of funds.

New York Silver Prices.

NEW YORK, July 8.—Following are the closing prices for the week:

London Sight Bankers	$4.88
Refined Silver, per oz., 1000 fine	60¼
Mexican Dollars	49@49½

SILVER.—The market remained steady to yesterday when it strengthened slightly, moving up again, closing firm at the advance. The East reports a fair export movement. Our English advices continue to note Russia still buying. The East Indies is also drawing. China does not take as much as she did at the corresponding time last year. The steamer for the Orient leaving yesterday took out in silver bullion for China $60,530 and for Bombay $109,000.

MEXICAN DOLLARS.—Tho export movement is enlarging owing to an advance in exchange. The steamer that left yesterday for China took out 542,281 dollars.

QUICKSILVER.—The market is steady at quotation, with a fair demand ruling.

Our market is quoted at $40 for domestic consumption.

COPPER.—The market has held to fairly steady prices. The East reports a continued free export movement and an increasing demand for home use.

The following statistics show an apparent increase in the consumption of England, France and Germany at the rate of 19,373 tons per annum. The Board of Trade returns for the first five months show the following results: Imports into England, 1896, 55,049 tons fine; do 1897, 55,305 tons fine; exports from England, 1896, 29,900 tons fine; do 1897, 19,634 tons fine; difference, 1896, 25,149 tons fine; do 1897, 35,671 tons fine; difference in stocks, January 1 to June 1, 1896, 12,377 tons fine decrease; do 1897, 2951 tons fine decrease; apparent consumption in England (including sulphate of copper made and subsequently exported), 1896, 37,526 tons fine; do 1897, 38,622 tons fine.

The following shows the consumption of France for the same months: Shipments from United States, 1896, 9297 tons; do 1897, 10,641 tons; shipments from England, 1896, 2783 tons; do 1897, 1312 tons; imports from other countries, 1896, 4917 tons; do 1897, 6144 tons; difference, 1896, 16,997 tons; do 1897, 10,641 tons; difference in stocks, January 1 to June 1, 1896, 1211 tons; do 1897, 962 tons increase; leaving 15,786 tons in 1896 and 17,135 tons in 1897; the increased consumption of England and France is, therefore, 1349 tons.

The official German returns for the first four months are: Imports, 1896, 18,339 tons; do, 1897, 22,958 tons; exports, 1896, 2887 tons; do, 1897, 2998 tons; consumption, 1896, 15,458 tons; do, 1897, 19,960 tons. The consumption of Germany, therefore, shows an increase this year of 4502 tons, exclusive of the copper obtained from their own mines, and from pyrites imported. To Italy, Austria and Russia 2937 tons have been shipped from the United States, against 3061 tons in the same five months of last year.

The local market is quoted as follows:

Ingot, jobbing	—@14
Ingot, wholesale	—@13
Sheet copper	—@17
Bolt	¼ and 5-16, 20c; ⅜ and larger, 17

TIN.—The markets on this coast, at the East and abroad are slightly weaker. The East reports a good demand, but free stocks and a selling pressure are against sellers.

We quote as follows in a jobbing way:

Pig, per lb	—@ 15
Plate, I C coke, heavy, per box	$4 10@4 25
" " " light, "	4 00@—

LEAD.—The market is very strong, in sympathy with the East. The strong markets at the East is due to the fact that Judge Kirkpatrick, in the United States Circuit Court at Trenton, N. J., had decided in the Government's favor its appeal against the Balbach Smelting and Refining Company. It was the source of conversation in customs circles yesterday. In brief, the decision means that lead bullion imported into this country for refining in bond must pay duty on the entire weight imported and not upon the weight of lead after gold, silver, etc., and refuse have been extracted. The smelting interests claim that the decision means that they will, to a considerable extent, be driven out of business by the decision, as it means they must pay duty on gold and silver, which is admitted free under ordinary conditions.

Our market is quoted in jobbing lots as follows:

Pig	4 10	@	4 35
Bar	—	@	4 60
Sheet	5 75	@	6 25
Pipe	5 00	@	5 50

SHOT.—The market is strong.

Our market is quoted as follows:

Drop, sizes smaller than B, per bag of 25 lbs	$1 35
Drop, B and larger sizes, " "	1 60
Buck, Balls and Chilled, do, " "	1 60

POWDER.—The demand continues exceptionally large. The market is steady.

The market is quoted as follows for Hercules: No. 1, from 11¾c to 17¼c, according to strength and quantity; No. 2, from 9c to 11c, according to strength and quantity.

BORAX.—The market is steady.

The market is quoted as follows:

Refined, in carload lots, in barrels	5
Refined, in carload lots in sacks	4¾
Powdered, in car lots	5
Concentrated, "	4½

IRON.—The market is strong with a continued heavy consumption. Stocks here are large with free consignments afloat. The East reports heavy consumption and free export movement.

AMERICAN.

ANTIMONY.—The market is steady.

Our market is quoted at 7¼@8¼c in a jobbing way. New York mail advices quote 7⅛c for Cookson's, 6⅞@7⅛c for Hallett's and 6⅞@7c for Japanese.

NAIL.—With the tariff out of the way better prices are looked for. The market is active.

Wire, carloads, basis per keg	....		
" jobbing, " "	$2 35		
Cut, carloads, " "	....		
" jobbing, " "	2 25		

PLATINUM.—The market is quiet.

Our market is quoted in a jobbing way at $10 to $15 per ounce.

ZINC.—The market is barely steady.

Our market is quoted at 10 to 15 cents, according to thickness.

ALUMINUM.—The market is steady.

We quote in jobbing lots at 50 cents per pound for ingots.

Chemicals.

The tendency of the market in all lines appears to be to stronger prices, although quotations are not changed and are not expected to be until after the tariff bill becomes law, so importers and dealers know where they stand. The East reports the market steadying up.

SPELTER.—The market is quiet

We quote our market in a jobbing way at 5 cents a pound.

BISMUTH.—The market is steady.

Our market is quoted in a jobbing way at $1.50 a pound.

BONEASH.—There is a good movement at firm figures.

Our market is quoted in a jobbing way as follows: Extra, 4c a pound; No. 1, 3¼c; No. 2, 2½c.

PHOSPHORUS.—The market is firmer.

We quote in a jobbing way at 70 to 75 cents per pound.

SODA ASH, 58% (LeBlanc process).—The market is firmer at $1.55 per 100 lbs. in a jobbing way.

CAUSTIC SODA, 60%.—The market is quiet at 3c per pound in a jobbing way.

HYPOSULPHATE OF SODA.—There is a fair demand at 2½c a pound from stores.

NITRATE OF SODA.—Market is steady.

Our market is quoted from store at 4c for 95%.

ACETIC ACID.—The market is steady at 6 to 12c per pound from store for carboys, according to make.

SULPHURIC ACID.—The demand is fair.

We quote in a jobbing way at 1½c per lb for 66%.

NITRIC ACID.—Our market is reported firmer from store at 6½@7c per pound in carboys.

BLUE VITRIOL.—Our market is steady.

We quote in a jobbing way at 4½c per pound.

Mining Share Market.

SAN FRANCISCO, July 8, 1897.

The market has been fairly active the past week with cross orders largely in evidence, although toward the close there has been more outside buying. This buying comes from people who have big tips on the market; and having money to burn, they fall in line and take shares off the manipulators' hands at high prices, which they would not touch at lower prices. The special feature of the market has been the advance of Sierra Nevada to $1.20 a share. It has been many a long month since these shares sold at over $1, but assessments and no life to them cause many outside shareholders to let go. Their selling admitted of better concentrating; and with good-sized holdings, work was started which would admit of playing on the credulity of the public, causing those still holding shares not to sell at an advance and, at the same time, bring in new buyers. The market price was shoved up on reports of striking an unexpected to outsiders, but the expected to manipulators, of a body of ore which it is hoped will make into rich ore. With this expectation put out on the street, another crossdrift was started, causing shorts to fill and outsiders to buy. While a body of high-grade ore can be run into in Sierra Nevada which would bring about good prices for the shares, present work does not appear to justify the belief that it is the intention to do so now; but work in the mines has been changed, and if the general situation down here and at the East changes still more for the better so as to admit of a good-sized deal, then the ore will be shown up. These remarks are applicable to several other mines on the Comstock. After the upmove in Sierra Nevada is over, it ought not to create surprise if the shares in another mine receive attention. On the Brunswick lode in Best & Belcher there is joint work being done by Con. Virginia, Best & Belcher and Gould & Curry, which can be made to show well, or, at any rate, enough to admit of working a deal. The same can be said of Savage. Then there is work in several of the Gold Hill mines that can be made to run into enough ore to make a deal on without having to show up a large body of good to high grade ore The Comstock lode is far from being worked out, and some day it will come to the front again.

From the Comstock mines official, semi-official and outside advices do not give any material change in the general situation since last week's review. Considering the number of miners actually at work in the mines good progress is being made by all. Much of the work in about all is of more or less of a dead-work character, but this has been the case for years past and will probably continue for some time to come, or until shares of the more desirable mines are better concentrated. In Utah they are still driving a north drift from the main west tunnel. No material change is reported. Work in Sierra Nevada is continued on the Layton tunnel and 900-foot levels. That attracting attention from the public is on the 900-foot level. The work on both these levels is important, but it is not reasonable to expect much ore to be struck without many shorts on the market or until the times are propitious for making a successful deal. The letters from Union are again skeletoned and contain nothing of interest. In the southwest drift on the 1000-foot level of Mexican they have struck some water and incidentally 50-cent rock—this ought to bring out a 25-cent or 50-cent assessment before long. From Ophir nothing of interest is at hand. Work is to the west on the 1000-foot level, and to the south on the central tunnel level. Official and semi-official advices from Con. Virginia are confirmatory of active exploiting and dead work on the 1000-foot, 1550-foot and 1650-foot levels. So far our advices are not of an encouraging character to shareholders, yet this may change any day for the better. The clean-up from all the ore milled assays $36,060. This indicates an assessment before long unless a body of good to high grade ore should be run into soon. Joint work to the east is continued by Best & Belcher and Gould & Curry on the 800-foot level Bonner shaft. Work in Savage is being prosecuted quietly without exciting attention. We have nothing from Hale & Norcross. Chollar continues idle.

In Potosi they are raising from the tunnel level and also from the 100-foot level. Active exploiting will be done when connections with the surface have been made. There is nothing new from Bullion. The Alpha letter reports an improvement, but if the work is correctly reported we need not expect the management to show up the lode of high-grade gold-bearing ore lying to the west. This lode is said by informed miners to run from Mexican to the south end mines, inclusive, with varying richness. From the joint west crossdrift of Con. Imperial, Challenge and Confidence nothing of particular interest comes to hand through official sources. The work in Confidence, Crown Point, Belcher, Seg. Belcher and Overman is practically the

same as has been given out as being done for several weeks past. In Yellow Jacket, it is stated, work is to be resumed on the 1000-foot level. As attention is being attracted to it it looks very much as if some person or persons have some shares to sell at higher prices. Yellow Jacket can be made to pay dividends. The joint work to the west by Yellow Jacket, Kentuck and Crown Point does not as yet attract attention. From Alta nothing new is to hand.

From the Brunswick lode our advices continue to report active work in Occidental, Chollar, Savage and Best and Belcher—the latter is done jointly by Con. Virginia, Best & Belcher and Gould & Curry. In Occidental the work is on the 550-foot and 650-foot levels, with low grade ore showing on the latter level. The work in Chollar on the 600-foot level is being closely watched, with the hope that when cross-drifting is done the downward continuation of the ore will be run into, which would justify better prices for the shares. They are still extracting ore from the levels above but the grade is poor. In Best & Belcher they are exploiting on the 300-foot level. Shaft No. 2 is being sunk.

GOLD IN COLORADO!
Colorado has within its limits some of the greatest gold mines that has ever been discovered. In Cripple Creek in 1892 there were a few prospectors looking over the hills; in 1895 the camp turned out over $8,000,000 in gold. Leadville, the old bonanza camp and the mineral product of which made Denver what it is to-day, is becoming a big producer of gold. New inventions for working low grade gold ores, together with the discoveries made to work rebellious ores, have opened up a field for the miners such as they have never enjoyed before, and Colorado has inducements to offer such as no other district in the world possesses, the record of the State in gold production for the last three years speaks for itself. Among the other prominent camps in the State are Telluride, Ophir, Rico, Silverton, Mineral Point, Durango, La Plata, Ouray, Saw Pit, Ironton, the Gunnison district and many others. New finds are being made and new camps are springing into existence every day. The Denver & Rio Grande Railroad, which is the pioneer road of Colorado and which has always been the miner's friend, reaches all the mining camps in Colorado. For elegantly illustrated descriptive books, free, of mines in Colorado send to

DIFFERENT DESIGNS OF BATTERY FRAMES IN QUARTZ MILLS ON THE PACIFIC COAST.

Battery Frames.

The design of a frame determines the position of the shafting, which bears with importance upon the life of bearings and belting, to say nothing of the presence or absence of menacing belts and pulleys about the working floors. The size of the frame timbers is determined by the weight of the stamp.

The knee frame, no doubt, is the heaviest and most costly, but seems superior to all, at least in solidity, position of shafting and consumption of belting. The accessible line shafting receives the most attention, the bearings are kept clean, dry and quite free from dust, while the equal and nearly opposite pulls of the main and counter belts tend to keep the shaft in good alignment. This frame also best affords an opportunity for large pulleys, up to 114 inches on the line and 84 inches on the cam shafts, and practice proves that moderately long horizontal belts, run without tighteners on these large pulleys, wear longer and transmit with less loss than short, highly inclined ones. The position of the belting overhead permits the least amount of falling particles to cut them out, and leaves the floors entirely free from dangerous obstructions.

The "A," reverse "A" and "double brace" frames are commonly met with, especially in silver mills where plates are absent, and while simple and less expensive, they can be made sufficiently strong. Although the battery sills, so long as they remain sound, furnish the surest foundation for the line shaft, such a position is, in either wet or dry crushing mills, very severe on belts and shaft, the sweepings, dust and ore particles falling upon the former and more or less of the leakage through the floors upon the bearings, which in their dark, inaccessible position generally receive the minimum of attention. Whether the shafting be placed in front or behind the battery, the belting is in either case highly inclined and the distance between centers of shafting is short, even though the frame be a tall one. Short inclined belts require, on the loose side, powerful tighteners to produce the necessary friction, so as to prevent slipping on the lower or small line shaft pulleys. The horizontal and excessive vertical pulls on the main and center belts and the occasional decay of the sills sometimes throws the shaft out of line,

San Francisco, July 17, 1897.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Different Sizes of Battery Frames in Quartz Mills on the Pacific Coast, 45. Map Showing the Central London Railway (Underground), 52. Dromedary Plowing for Wheat Near Cairo; Syrian Cultivation of Olive Orchard, 54.

EDITORIAL.—Battery Frames, 45. Good Work of Commissioner of Patents Butterworth; Placers of the Yukon; Mining Machinery and the State Fair; A Golden Jubilee; The Gold Yield of 1897; The International Mining Convention, 46.

MINING SUMMARY.—From the Various Counties, of California Nevada and Other Pacific Coast States and Territories, 50-51.

ELECTRICAL PROGRESS.—American Electrical Equipment in London, 52.

SCIENTIFIC PROGRESS.—Molecular Physics of Cast Iron; Tunnel Construction in the Alps; Fallacy of Transmuting Base Metals, 53. Improvements in Sterilization; Acetylene Gas; Detection of Carbon Monoxide in Mines; Chemical Characteristics of Monazite; Electric Research; Lord Kelvin's Address Upon the Earth as a Human Abode; Electricity from Fuel, 53.

MECHANICAL PROGRESS.—Evolution in Mechanics; The Uses of Exhaust Steam; The Longest Bridges; Freezing Check Valve; The Rise in Steam Pressures; Burning Oil in Great Britain; Sewing Machines Annually Made in the United States; Paying Load of Steamships; Cost of Bricks in Boston; Telegraph Poles Made of Paper, 53.

THE MARKETS.—Eastern and Local Markets; Mining Share Market; Sales in San Francisco Stock Board; Notices of Assessments, etc., 66-67.

MISCELLANEOUS.—Concentrates, 47. Practical Workings of Chlorination, 48. Assaying of Gold and Silver; A Magnetic Mountain; Alabama Gold Mines, 49. The International Gold Convention; Level Bottom of the Pacific Between California and Hawaii; The Survival of the Ancient in Plows; Number of Miners in Great Britain; Annual Meeting of the De Lamar Mining Campany of Idaho, 54. Coast Industrial Notes; Recently Declared Mining Dividends; Recent California Mining Incorporations; Personal; Obituary; Commercial Paragraphs, 56. Notices of Recent Patents; List of U. S. Patents for Pacific Coast Inventors, 62.

COMMISSIONER OF PATENTS BUTTERWORTH is doing some good work since assuming charge of that important office at Washington, D. C. He has recently disbarred eight fraudulent patent attorneys and is making it unpleasant for other rascals in that line of business. It was about time.

THE reports from the placers on the Yukon rival the tales of mining in early days in California. That exceedingly rich deposits are being worked there can be no doubt, and that the new discoveries made on the British side of the line are by far the most important seems certain from all reports. On the steamer Excelsior, which arrived in San Francisco last Wednesday, were fifteen miners from the Yukon. They and the Alaska Commercial Company brought down nearly $500,000 in gold. The new district at Klondyke is about thirteen miles in length on the Yukon. As an evidence of the value of the gravel wages have gone up to $15 a day and board.

The International Mining Convention.

The International Gold Convention, which met in Denver last week, was run upon lines that will give the miners of the West encouragement to take a more active interest in the next meeting, which will be held in 1898 at Salt Lake. The fact that the place of holding these conventions is changed from year to year will preclude the possibility of their becoming controlled by local, political or other interests not in harmony with the welfare of the industry that they represent. While the work done in a gathering so unwieldy as these conventions must necessarily be will not be apparently beneficial as far as the record of the proceedings go, they can do much through committees. Most of the good record made by the California Miners' Association was from work done by the executive committee and other committees appointed or arranged for by the conventions. In Denver committees were appointed for needed legislation for the industry, and it will be through such committees that most of the work of the International Mining Convention will be conducted in the future.

The mining industry is not represented as well as are nearly all other industries in this country by associations or by officials in the Federal or State governments, and, as a result, less has been done for the industry by the authorities at Washington and by the various State governments than for any other. The fault has been that the miners have never stated what they needed. The industry does not need any assistance that will be of expense to the Government, and its requests for legislation in the way of needed laws may easily be secured, if through such organizations as the International Mining Congress or the California Miners' Association the miners show plainly what they want.

Mining Machinery and the State Fair.

The advantages of making exhibits of mining machinery at the California State Fair to be held in Sacramento from September sixth to the eighteenth is well worth the consideration of the manufacturers. Sacramento is yet a point of importance more than any other city in the State except San Francisco as a base of supplies for the mines of a number of the counties leading in the output of gold. To many people farther away from the mining districts Sacramento is looked upon as rather a city supported by agriculture, and of further importance only as the capital of the State. Yet every year probably nearly as many people from the richest mining districts of the State make pilgrimages for shopping or amusement to the old capital as come on to the "Bay." The State fair has long been a leading attraction of the year for the miners and mine owners of Sierra, Nevada, Placer and El Dorado counties, which produce one-third of the gold yield of the State. To those counties Sacramento is a local metropolis with which they are much more in touch than people farther away generally imagine.

The exhibitor who is wise considers not only how many will see his wares, but whether they are the class of people who need them or can afford them. About the only class of people who are spending much money in these times are the miners. The most prosperous industries in San Francisco to-day and for several years back have been those supplying machinery for the mines, and this is true of all large cities of the West. It would appear that if it is worth while exhibiting any class of products of the factories at the State fair certainly it will pay to exhibit mining machinery.

It is generally understood that more money is being spent on the mines of California than is being taken out. This is due to the large amount of development work going on and machinery being purchased for newly opened mines. In a few years the proportion of money spent in machinery will be much less than at present. It behooves those interested to take the flood that leads on to fortune at its tide.

A Golden Jubilee.

It will soon be fifty years since Marshall discovered gold in Sutter's millrace at Coloma, California. Probably nothing done in modern times led to so much for the material progress of the world. Certainly no other event in American history was so influential in leading to the building up of this country. Within a few years, following the miners as their pioneers in every district, our people have opened up to settlement a larger area of territory, valuable as a source of supply for nearly all the necessities of man, than has ever before in the world's history been brought within the limits of civilization in so short a time. That this great advance, with its results to the trade and commerce of the world, has been achieved by the discovery and development of our mineral resources, more than all other influences combined, no man can pretend to deny. But for mining a large part of the great empire west of the Mississippi might yet be a savage waste.

It is proposed that there should be a semi-centennial celebration—a veritable "golden jubilee"—held next year. In six months—January 19th—will come around the fiftieth anniversary of the discovery by Marshall. If a celebration is to be held then the time for preparation is very short.

While gold was known to exist and had been mined in California long before this find by Marshall, it was that that stirred up the excitement that caused the opening of the great placer mines and the rush of immigration in 1849. Placers had long been worked, particularly in the southern part of the State, by the Indians. This was discouraged by the Missions as much as possible. In 1843 Manuel Castanares, a Mexican officer, tried to arouse the attention of his Government to the importance of these resources. Yet these facts should not prevent a celebration of a golden jubilee, in honor of the Coloma discovery or of the pioneers who came here in those days of hardship and laid the foundation of a mighty empire.

The Gold Yield of 1897.

The reports that have come from the gold mining districts of the world as to the amount of the yield for the first half of 1897 indicate that the output for the year will far exceed that of 1896. There is not one of the old districts of importance that does not show unusual activity and give promise of a larger output. Besides this, many new districts are adding something to the total. The African yield for 1896 was about the same as that for 1895; but for the first five months of 1897 the returns show a product of 1,136,902 ounces. At this rate, without any further increase for the rest of the year, the Rand would yield $10,000,000 more in gold than it did last year. It is more than likely, provided no political troubles arise, that the figures for the next seven months will be greater in proportion than those of the first five; for many new stamps are beginning to drop on large properties in which immense ore bodies have been developed, and there is a promise of more increase of crushings from this source than there will be a decrease from closing up of mines that will not pay a profit under present conditions. In the Australian colonies generally there is an increase in the output, so far as heard from, and particularly in Western Australia. There is less speculation and more mining in all the colonies than there was last year. Prices of shares have gone down, but the gold output has increased.

Russia is looked upon as the coming gold field—particularly Russia in Asia. Into Siberia and along the Caucasus of late a large number of experienced mining engineers from other gold fields have gone, sent by capitalists of Russia and other parts of Europe interested in gold fields. The crude and expensive methods in vogue there will soon be improved and the output of gold increased, not only through the opening up of new districts, but also through the working of lower grades of gravel. There is every reason to expect an increase in the Russian output for 1897.

The larger districts in British Columbia have increased their yield during the first months of this year. There are a great many mines being opened up with large capital in Ontario and in the newer districts in British Columbia. Besides this, reports that rival the tales of early days in California come from the Klondyke placers on the Yukon.

The United States in 1896 made a larger increase in the yield of gold than any other country in the world, and there seems every reason to believe that the output for 1897 will be far greater than that for 1896. In Colorado the Cripple Creek output has shown a large increase over last year, and there is also a perceptible increase in the receipts at the Denver mint from nearly all the other districts of that State. Many mills are being built and a large amount of low-grade ore, which under previous conditions could not be worked, is now being crushed. In California there is hardly one of the old mining counties in which a number of large new mills have not been erected. The best evidence of the fact that the gold yield of California is increasing is in this that the number of stamps falling is largely increased and very few mines or mills have been shut down.

Alaska is increasing its output largely along the coast from the quartz mines, and there will be forty per cent more stamps dropping in this than last year.

In Arizona, New Mexico, Nevada, Montana and Idaho more capital has been invested within the last eighteen months than for half a decade before.

Altogether, in the old districts—not only those which have continued their output, but many which have been abandoned—and in new districts the world over, there is greater activity and evidence of an increase of yield than there was last year. It is altogether too early to predict how much the increase will be over the output of 1896; but that it will be large there can be no doubt. What is best is the fact that development work now being done will insure a large yield for years to come and great activity in the industry.

Concentrates.

THE breast of the Sioux-Ajax tunnel at Tintic, Utah, is now 2700 feet into the hill.

WORK has been commenced on the Crows Nest Pass railway in British Columbia.

IN the Ajax mine at Tintic, Utah, they are to sink to the 1000-foot level from the 600.

A FOUR-FOOT ledge of nickel ore has been found in the Trout Lake district, B. C., near Ferguson.

SEVERAL copper claims have been located on the east slope of the Rockies west of Calgary, B. C.

DURING the year ending June 30, '97, there were coined 21,203,701 silver dollars at the U. S. mints.

THE output of the Cripple Creek district for the first six months of 1897 in gold is placed at $6,075,000.

THE owners of the Little Kid mine, near Bald mountain, Montana, will erect a large stamp mill shortly.

A RAILROAD is to be built into the Deep Creek mining district in Utah. This will give an impetus to the mines.

THE Anaconda Company of Montana has increased its output of copper lately, producing in May 12,262,501 pounds.

OUT of a pocket on Ash creek, Klamath river, in Siskiyou county, Cal., last week, two men took 217 ounces of gold.

A DISCOVERY has been made of nickel in the Cepango district, on the Little South Fork of the Poudre river, in Colorado.

NEGOTIATIONS are pending for the reopening of the Amador Consolidated mine, adjoining the Allison Ranch, Grass Valley, California.

AN air compressor plant has been put up at the Providence mine at Nevada City, Cal., to run four machine drills, a hoist and pumps.

THE owners of the Republic mine in Eureka camp, near Kettle Falls, Wash., are to put up a mill with a daily capacity of 100 tons.

IT is reported that the Albany group of mines in Wolf creek district, southern Oregon, have been bonded to Senator Jones of Nevada.

IN Rossland, B. C., several mining claims have been gotten rid of by the owners by raffling. One was appropriately named the White Elephant.

THE Palmer Mountain Tunnel Company, near Loomis, Idaho, have installed a five-drill air compressor plant for boring 3000 feet into Palmer mountain.

THE Boston and Montana Company is producing nearly 5,000,000 pounds of copper per month. The May product of the Calumet and Hecla was 7,794,916 pounds.

THE Sunset group of mines in Tennessee Gulch, Gold Creek district, Nevada, has been bonded to George W. Addison, representing Eastern people, for $50,000.

IT is reported that a rich ledge of copper, 30 feet in width, has been uncovered in Summit camp, in the Kootenay country, B. C. The claim is bonded for $50,000.

THE California mine, in the Cable cove district, near Baker City, Oregon, has been sold for $30,000 to Butte and Denver people, who will erect a 10-stamp mill at once.

IN a rock-drilling contest at Park City, Utah, last week, Eric Berg of the Daly drilled 97⅛ inches in 15 minutes, although he broke two drills during the contest.

IN the tariff bill which recently passed the Senate and is now under discussion by a conference committee, there is a reduction of the duty on cyanide of potassium to 12½%.

THE Oregon Improvement Company has purchased for $25,000, from Judge Orange Jacobs and others, 320 acres of coal lands adjoining the Newcastle mines in Washington.

THERE is reported a discovery in northeastern Alaska a lake of crude petroleum several miles wide and eight or ten miles in length. Surrounding it are said to be rich deposits of coal.

THE Northwest Pacific Exploration Association has been formed to operate mineral and coal properties near the Pend d'Oreille river between Spokane and the international boundary.

THE narrow-gauge road between Trail and Rossland is to be turned into a broad-gauge line, and the present rolling stock, which includes Brigham Young's private car, is to be sold.

THE deepest shaft in the Anaconda copper properties in Montana is the Bell, which is down 1500 feet, and the company now propose to sink deeper—probably to the 2000-foot level.

SUPERINTENDENT KARMEEN has made arrangements for the erection of cyanide works at the Dunderberg mine, near Bridgeport, Mono county, Cal. The mine has been showing up well.

THE Orphan Bell mines on Bull hill, at Cripple Creek, Colorado, have been sold for $450,000 to Eastern people, and the Vindicator mine on the same hill to D. H. Moffat of Denver for $300,000.

THE California one of the lost mines of the desert is reported to have been rediscovered by John F. James and Henry Blake in Arizona, south of Sentinel station, near the Mexican border.

THE Alaska-Treadwell reports for June: Bullion shipment, $60,073; ore milled, 23,596 tons; sulphurets treated, 372 tons; of bullion there came from sulphurets, $21,160; gross expenses for period, $28,891.

A FIELD FIRE caused the burning of the Seaton Mining Company's hoisting plant at Drytown, Amador county, Cal., and endangered the plants at the Pocahontas, Gover and California this week.

OWING to the recent reduction in wages of native labor in the Rand, South Africa, the supply is decreasing, many of the natives going home. In the last week of May 730 registered against 1341 who quit.

THE Keswick, Cal., *Miner* says that the Mountain Copper Company there annually produces over $1,750,000 worth of copper. It employs over 300 men, taking out probably 500 tons copper ore every twenty-four hours.

WORD comes from Toluca, Mexico, that a syndicate, headed by C. D. Lane of California and W. S. Stratton of Colorado, has purchased La Esperanza gold mining property, in El Oro district, for $6,000,000, Mexican money.

OVER 15,000 men are now employed in mining in Sonora, Mexico; in Hermosillo 4500, Ures 1000, Arizpe 2000, Moctezuma 1500, Sahuaripa 1500, Magdalena 1600, Alamos 1500, Altar 2500. The Minas Prietas employs about 3000.

AN Alaska man is to take 700 sheep by steamer to Dyea and from there drive them across the pass and along the shores of the chain of lakes to the headwaters of the Yukon, and thence into the placers at Circle City and Klondyke.

THE shipments from the Rossland mines for the first six months of the year aggregated 31,980 tons, while there were 3000 tons milled in the camp. Of this, 22,480 tons came from the Le Roi and 5850 tons from the War Eagle.

THE contest for the possession of the Candelaria mine has been reopened by the filing of another suit in a City of Mexico court by Mark Birmingham of Boston against Dan Burns and associates, who are now in charge of the property.

IN London last week a deputation waited on Sir Wilfred Laurier, the Canadian Premier, to urge the expediency of opening up a route to the Yukon country. Laurier promised to propose an appropriation for exploration purposes.

DIRECTOR OF THE MINT PRESTON writes that he thinks the world's gold product for 1897 will be $230,000,000. He thinks the United States will furnish $60,000,000 of this. He is not willing to credit California with more than $15,000,000 of that amount.

THE copper production for the first five months of 1897 in the United States is estimated at 88,998 long tons against 85,355 tons the corresponding period of 1896. The European production in the same period is placed at 36,628 tons for 1897 and 35,200 tons in 1896.

IN spite of a decrease in the valuations of property in the fruit and grain growing parts of Placer county, the assessment roll for 1897 shows a considerable increase over that of the previous year, due to the healthy growth in the mining districts of the county.

GENERAL GASPAR SANCHEZ OCHOA, owner of Mount Popocatepetl in Mexico, is building a cable railroad to the crater from Glamacus, to be used for the transportation of sulphur to be prepared for market. The road will also be used for carrying up sightseers.

ANOTHER increase has been made in the shipment of manganese iron ore from Leadville, Col., to the Illinois steel works, and they now amount to nearly 150 tons daily. It is stated by representatives of the steel company that still further increases will be made.

THE Elkhorn (Montana) reports for May: Estimated value of bullion shipped, $20,295; gain on April shipments, $25.58; net value of bullion, $20,320.68; returns from ore shipped, $6,837.71; total receipts, $27,158.29; current expenses, $26,703.80; profit for May, $454.49.

THE cases against Mining Experts Hague and Womble, charged with breaking into the Silver Peak mines, have been dismissed at Hawthorne, Nevada, as has also the charge against L. J. Hanchette. This is supposed to be preliminary to a civil contest for possession of the mines.

THE Gold Creek, Nev., Mining Company has made application at the United States Land Office for twenty-nine patents on placer mines. The patents cover 4480 acres, which at $2.50 per acre will cost $11,200. The Government charges $2.50 per acre for placer ground and $5 per acre for quartz claims.

NINETY carloads of machinery and iron have arrived at San Luis Obispo from San Francisco for the asphalt mines in northern Santa Barbara county. Two pipe lines each 28 inches in length are to run from the mines to Gaviota and a branch railroad will be built to the coast line of the Southern Pacific.

THE Cripple Creek, Col., correspondent of the Denver *Republican* estimates the gold output of that camp for June at $1,190,352. The yield for the first six months, with the promises for the rest of the year, make it not at all unlikely that the estimate of $12,000,000 for the year will not be far above the mark.

ANOTHER English syndicate has made an offer to erect a smelter at Vancouver, B. C., for a bonus of $100,000, payable as the ore is smelted. There are several companies after similar terms, and the Council are inclined to wait for some one willing to erect a smelter for the profits he believes are in it as his only reward.

FOLLOWING are the returns of the Ferreira, of the Rand, South Africa, for May: Eighty-stamp mill ran 29 days 6 hours, crushing 10,462 tons, yielding 8156 ozs 2 dwts; yield from cyanide works, 2782 ozs 12 dwts; concentrates caught, 290 tons, assaying 7 ozs 15 dwts—2247 ozs 10 dwts; total gold from all sources, 13,186 ozs 4 dwts.

GENERAL W. W. O'NEILL has interested Eastern capitalists with himself to develop copper mines in the Grand Canyon of the Colorado, in Arizona. Four camps have been established at points where development work is being done. Nature in this case, in cutting the wonderful canyon, has done a good deal of developing herself.

THE new 150-stamp mill of the Diamond Hill mines at Hassel, Mont., is ready for work. Everything is run by electricity, generated by water power from the Crow river. The cars taking the ore from the mine to the mill are operated by the trolley system, and all the drills and other works about the mine and mill are operated by electricity.

A BLOCK of 100 shares in the Homestake Mining Company, in the Black Hills, South Dakota, sold last week for $30 each, or at the rate of $5,000,000 for the whole of the stock. This company has paid in dividends $6,275,000. The same owners control the Deadwood Terra, which has paid $1,320,000 in dividends, and the Highland, which has paid $3,244,918.

THE four big pumps to be used in draining the down town mines in Leadville, Col., have reached that place. Two will go to the Penrose mine and two to the Bonair. Those at the Penrose will pump 1200 gallons per minute, and those at the Bonair 1000. This with other means will make the total handled by the Leadville Pumping Association 4000 gallons per minute.

THE total amount of money in circulation in this country on the 1st inst. was $1,646,028,246, which sum represents an increase of $136,300,000 as compared with the corresponding date last year. The Treasury officials estimate the population of the United States on July 1 at 72,937,000. On the basis of that estimate, the circulation per capita amounted to $22.57—an increase of $1.42 as compared with the corresponding date in '96.

HENNEN JENNINGS, who is one of the leading mine managers in South Africa, in giving evidence last month before the Mines Commission as to the dynamite monopoly, stated that he had a cable from Henry Pichoir in San Francisco, offering to put the article afloat in South African ports at 17 cents a pound. This offer would mean that but for the monopoly dynamite might be landed at the mines at about one-half the present price. The three companies in California, it was stated, could agree to increase their output to supply 16,000 cases monthly within three months.

THREE important strikes were made in Colorado in June. These were the discoveries of new and rich ore bodies in the Mollie Gibson, the Gregory-Bobtail and the Argentine-Juniata—all old mines, with records of the past. The Mollie Gibson has not paid dividends for two years, but the shareholders have divided four millions. These finds will do much to encourage belief in the permanency of Colorado mines. The Gregory-Bobtail is the oldest lode claim in the State.

THE recent deplorable explosion of giant powder at Georgetown, Cal., will serve a good purpose, if taken as an object lesson, illustrating the criminal folly of carelessly storing giant powder, as is so often done. In such a dangerous matter it is better to be foolishly careful than carelessly foolish. There is a State law regarding the sales, etc., of explosives, and it is an unwritten law of common safety that the utmost care be taken in the storage and handling of so deadly a compound.

THIS PAPER declines to be held responsible for the assertions or acts of self-constituted "agents." No one is authorized anywhere to transact business for this paper unless in possession of proper credentials. From British Columbia and Southern Oregon come complaints of courtesy abused and fraudulent collections. This is, of course, annoying, and a matter of serious regret, but a notice has been often plainly given in effect as prominently published at the head of the editorial page in this and every issue.

FOR the week ending July 3 the ore shipments from Rossland, B. C., amounted to 1806 tons, the largest in the history of the camp. This is at the rate of nearly 100,000 tons a year, valued at about $30 a ton. The Slocan country is shipping about 700 tons weekly, valued at about $80 a ton. The Nelson district is sending to the Hall mines smelter about 1200 tons a week, valued at about $20 a ton. The three districts, Rossland, Slocan and Nelson, are therefore producing ore to the value of about $130,000 a week, or nearly $7,000,000 a year.

REPORTS received at the Bureau of the Mint up to June 30, 1897, show that the balance of silver bullion at the several United States Mints, purchased under the act of 1890, was 115,438,426 ounces, which cost the Government $104,336,512. The coin value of the same in standard dollars is $149,253,769. The total number of silver dollars coined under the several acts authorizing the coinage of silver dollars is as follows: Act of February 28, 1878, $378,166,793; act of July 14, 1890, $68,748,477; act of March 3, 1891, $5,078,472; total, $451,993,742.

DURING the first half of 1897 this country exported 64,902 tons of fine copper, or 6,584 tons more than in the corresponding period for 1896; 30,687 tons more than in 1895; 25,133 tons more than in 1894; and 44,541 tons more than in 1893. For the half years of 1893–1897 inclusive the amounts produced and not exported were as follows in tons: 48,587, 42,232, 45,497, 43,062, 42,096. While the United States production has increased 55 per cent, the exports increased 218 per cent. Since January 1, 1893, four and a half years, the total United States exports of copper amounted to about 924,564,000 pounds, worth, at 11 cents a pound, $101,702,990.

THE duty on cyanide of potassium is reduced in the proposed tariff to 12½%. It and prussiate of potash have been paying 25%. Prime German red prussiate of potash, in cases, was quoted in New York this week at 38 cents per lb. The tariff recently passed by the Senate proposes a duty of 4 cents per pound on prussiate. American manufacturers of cyanide of potassium have asked for a duty on that article of 8 cents per pound. So far as the miner is concerned, the difference either way is very little, as a relatively small quantity is used in the process. The most recent New York quotation was 28 cents per pound in cases of 112 pounds.

THE copper market is improving rather in the foreign than domestic demand, the foreign consumption being in excess of the enormous consumption of last year. The British and continental requirements absorb all the copper this country can spare. The aggregate transactions in this direction during June are estimated at from 15,000,000 to 20,000,000 pounds on a basis of 11 and 11¼ cents. The stocks in this country and visible supplies throughout the world are at such a low level that any sudden increase in consumption would quickly influence the price. For some time strong influences have been at work to prevent the prices from going up engineered by the speculators.

AT the annual meeting of the stockholders of the Consolidated Tiger and Poorman Mining Company, at Spokane, the report of the manager stated that after the fire the rebuilding of the works was delayed and the mine was allowed to fill with water, it being thought at the time that it would be cheaper to pump it out when they got ready to start up than to keep it pumped out during construction. The construction account for the rebuilding of the plant, which consists of a 400-ton concentrator, ore bins, tramway, boiler house and boilers, carpenter shop and blacksmith shop, repairs and additions to the Poorman hoist, shows that there has been expended $101,552.23. The net liabilities of the company are about $90,000, but the profits over working expenses are now showing from $15,000 to $20,000 a month. The mine is said to be looking better than ever, the 1200 showing 10 to 12 feet of ore.

OF THE yield of Cripple Creek, Colorado, in June, amounting to between $1,000,000 and $1,150,000 in gold, 70 per cent came from high-grade ores sent to the smelters. The rest was from low grades. An increase in the amount of low-grade ores worked and a consequent increase in the total output may be expected for some time with the continued reductions in costs of working and increase of milling facilities. In this connection the *Mining Investor* says: "There are immense bodies of low-grade ore in the mines of Cripple Creek, and some large quantities of it taken out, that are at present lying idle—next to worthless, one might say—because they cannot be treated at a profit. They run in value all the way from $5 to $10 per ton, and that they cannot be handled is a very heavy loss to the owners of Cripple Creek mines. I think that the time will come, and at a date not so very far distant from the present, when this class of ore will be handled. It will come gradually, of course, but with every reduction in the cost of treatment the amount of the output will be increased and an incentive will be given to those who are operating to increase their efforts towards the one end. At the present time several new reduction plants are being built and several others already established are adding to their treating capacity."

Practical Workings of Chlorination.

Written for the MINING AND SCIENTIFIC PRESS by THOMAS G. TAYLOR, JR.

Ores that are now being worked by the chlorination and cyanide processes were until a few years ago left untouched, because they were considered rebellious, or, if they contained enough free gold to pay for the working, they were allowed to run off as tailings after the free gold had been extracted. In this age of invention and discovery it is a simple and inexpensive matter to save and extract the precious metals from many of those ores which were, not long ago, considered rebellious. The first successful step toward this was the invention of the concentrator, which separates those rebellious particles called sulphurets from the sands or gangue matter of the ore, thereby making a valuable product, which is treated by the chemical process to which it is best adapted.

As this article is to treat of the chlorination of ore I will say nothing of the cyanide process, except that it can not be used on all ores suitable to chlorination on account of their containing certain base metals and their salts, which have a greater affinity for the cyanide than the gold has, thus necessitating a stronger solution of cyanide, which increases the cost of extraction and in cases amounts to more than the value of the gold extracted.

With metallurgists it is still an unsettled question in some cases as to whether the gold in the sulphurets is in a mechanical or chemical combination with the base sulphides, but by giving the ore an oxidizing roast, which liberates the sulphur, it can be treated by the chlorination process, so that as much as 90 per cent of its assay value in gold can be extracted. Taking it as a good example of the practical working of a chlorination plant, I will endeavor to describe the process as carried on at the Champion mine at Nevada City. These works were among the first built, having been constructed for the Merrifield mine, which is now a part of the Champion property. Here they work between three and a half and four tons in twenty-four hours.

Besides gold and silver, this ore contains pyrite, chalcopyrite, galena, sphalerite and the sulphides of arsenic and antimony, with some sands of quartz and calcite. When the ore is brought from the mills it is piled on the drying platform, which is built over the furnace at the end near the stack, so that when a charge is put into the furnace it contains but little moisture. The furnace used is known as a hand reverberatory, with two hearths, the upper and lower or finishing hearth. It is 70x10 feet on the inside, one-third of the length being the finishing hearth and the other two-thirds the upper hearth.

The charges are put in through a hopper or opening on top at the upper end, by removing an iron plate and shoveling the ore in. At this end the ore is banked up so that there are ten charges receiving a preliminary roast before a charge is made. As one is roasted it is drawn from the furnace, the next moved from the upper hearth to the lower, the next in order spread on the hot end of the upper hearth, the others being moved forward in their respective orders and a new one put in at the hopper. The idea of banking the ore at the upper end is to save fuel, as some sulphur is being burned off for sixty hours before a charge is spread. In this way ten charges are occupying the space of one, and this end of the furnace can be run at a lower temperature. It also allows a slow roast, which is more beneficial than a quick one, as the ore does not cake as it would at a higher heat. When a charge is spread on the upper hearth it is raked every few minutes, so that a new surface is turned up and the sulphur burned off. After the one ahead of it on the finishing hearth is removed this charge is moved down and spread, the next in order spread on the upper hearth, and so on.

The temperature on the lower hearth being much higher than on the upper, the ore is raked more often. After nearly six hours on this hearth the ore is pushed to the center from both sides of the hearth and the furnace fired up. This is done to get the sides of the hearth hotter for the finishing roast. When this is accomplished the ore is divided, part being pulled to one side and part to the other, allowing the center to get hotter. Finally it is well spread over the hearth and thoroughly raked, until no signs of green ore remain in the charge. It is then salted and drawn. The salting is done by throwing the salt in through the stirring doors and mixing thoroughly; then a plate is removed in the hearth and the charge raked into the vault below. The amount of salt used is about 26 pounds to a charge of 1800 pounds of ore.

The ore is allowed to remain in the vault about six hours, or until just before the next charge is drawn, when it is spread out on the cooling floor. After being spread for a little time it is thoroughly moistened with water and screened, the latter for the purpose of breaking all lumps. The damp ore is gassed to a better advantage than dry ore, as moisture aids in the reaction with chlorine and the metals, and damp ore does not pack like dry ore, thus giving the gas a better chance to circulate.

After the process of screening the ore is shoveled into the gassing tub, care being taken not to pack the ore in filling the tub. There are five of these tubs, each one holding about three and a half tons of ore. They are 6 feet 8 inches in diameter and 2 feet 6 inches deep, inside measurements. Each is fitted with a false bottom containing half-inch auger holes, covered with burlaps for a filter, and coated inside and out with tar. The burlaps generally last for three fillings, care being taken not to cut them with the shovel in emptying the tub. When the tub has been filled with ore the cover is put on and the seams stopped up with flour dough, the tube from the generator connected and the gas allowed to enter. This connection is made through a hole in the side of the tub below the false bottom.

The generators are charged just before the connection is made, one charge being sufficient for each tub of ore. The generator charge consists of 32 pounds of sulphuric acid, 16 pounds of manganese, 20 pounds of salt and about three quarts of water, all being put in at one time, except the acid, which is put in a lead vessel over the generator and so fixed that a constant flow of acid is obtained, thus keeping the gas at a constant pressure. The following chemical reaction takes place in generating the gas:

$$MnO_2+2NaCl+2H_2SO_4=Na_2SO_4+MnSO_4+2H_2O+2Cl.$$

From time to time the contents of the generator require stirring, which is done by means of a stirrer fitted in the generator with a handle projecting through the top. The generator and all the piping carrying the gas are made of lead, as the acid has no effect on this metal.

There are two generators, situated side by side; thus two tubs of ore can be gassed at one time. A water bath surrounds them, with a small furnace underneath, where a slow fire is kept, as heat aids in the reaction which liberates the chlorine. All adjustable connections on both generators and tubs are covered with dough, so there is no possible chance of a leakage of gas. As chlorine has a very disagreeable smell and acts upon the passages of the throat and nose, causing irritation and inflammation, great care should be taken that none should escape into the works.

The gassing of a tub takes about six hours; that is, from the time that a tub is connected with the generator until the gas appears at the cover. This is found by removing a plug in the cover of the tub and holding a glass stopper, with ammonia on it, at the hole. If the gas is up, fumes will rise from the hole. When the gas is up, the connections from the generator are removed and the hole stopped up by means of a wooden plug and dough, and the tub is allowed to remain in this manner, with the gas, for about forty-two hours before being leached.

In order to prevent hydrochloric acid from entering the tub with the gas, the gas is forced through clear water, the water absorbing all acid that may form in generating the gas. This acid has a very harmful effect upon the ore, as it dissolves the oxides and causes—when sulphides are present, which would be in consequence of defective roasting—the formation of hydrogen-sulphide, which will precipitate the soluble gold chloride before it leaves the tub. Other substances which combine with the chlorine cause no reaction which will precipitate the gold before the solution is drawn off.

The chemical action between the chlorine and gold is as follows: When gold is treated with dry chlorine it forms the dichloride of gold, $AuCl_2$. This, when treated with a little water, breaks down into auric chloride, $AuCl_3$, and aurous chloride, AuCl, and by further treatment with water the latter yields auric chloride and gold. This auric chloride is drawn off and from it gold is precipitated, while the gold, which is the result of the last action, evidently remains in the ore.

As this amount in gold chlorination should not exceed 10 per cent of the assay value of the ore, it is not worth extracting unless the ore is very rich, as the ore would have to be dried, screened, regassed and leached, and then there would still be a certain per cent left in the tailings. That a higher extraction can not be obtained by allowing the gas to remain in contact with the ore for a longer period than is practiced was proven at the works a few years ago. The works were shut down for some time, a tub having been gassed previously and not leached until the works were again started. Samples assayed showed no increase in extraction over the other charges which are in contact with the gas for only the forty-two hours.

The process of leaching is next in order. At the expiration of the specified time a stream of clear water is forced through the opening below the false bottom, the plug in the cover being removed and a hose inserted, to carry off the excess of gas, thus preventing its escaping into the works. When the water has reached the top of the ore it is shut off and allowed to stand for an hour or more, when it is drawn off through the same opening, and a stream turned in at the top of the tub; thus there is a continuous percolation through the ore.

The first solution that is drawn off will give no reaction for gold, as it is the water which occupied the space between the false and true bottom, and is, therefore, allowed to run to waste. Every few minutes some of this solution is caught in a dish and tested for gold, the test being made by adding ferrous sulphate to the solution, and a dark brown precipitation will appear if the solution contains gold. As soon as this precipitate appears the stream is directed into the precipitating vats, which, like the leaching tubs, are coated inside and out with tar, but having no false bottom, and are 6 feet in diameter and 3 feet deep. Two of these vats are filled with solution before the leach is complete. When the solution ceases to give a precipitate with the ferrous sulphate the leach is finished. The water is then shut off from the ore and the tub drained of the remaining liquid. Enough ferrous sulphate is then added to the solution in the vats to precipitate all of the gold. The solution is thoroughly stirred and allowed to settle, and then tested to see if the precipitation is complete. This is done by dipping from the top and adding ferrous sulphate; if a precipitate still shows, more sulphate is added, the solution stirred, allowed to settle and again tested, and so on until no precipitate shows.

The following chemical reaction takes place between the solution and the ferrous sulphate:

$$2AuCl_3+6FeSO_4=Fe_2Cl_6+2Fe_2(SO_4)_3+2Au.$$

The solution contains, besides $AuCl_3$: $CuCl_2$, CaCl, MgCl (if any Mg. is contained in the ore), and $FeCl_2$ and $PbCl_2$ in small amounts.

For the purpose of settling, the vats are allowed to stand until the next morning, before the solution is drawn off. This is done through a hole in the side of the vat, about 3 inches above the bottom. As there is always more or less fine gold held in suspension in solution, the copper is precipitated in order to bring the gold down with it. The precipitant used is sodium sulphide, which is made at the works by boiling 60 pounds of sulphur and from 70 to 80 pounds of caustic soda with about 100 gallons of water, the boiling being continued until all the sulphur is dissolved. This precipitating takes place in another vat, called the copper vat. Another method also practiced at the works for precipitating the copper is by means of scrap iron. This copper product is very rich in gold and is sold to the smelter. The ferrous sulphate used is also made at the works, by dissolving scrap iron in sulphuric acid.

As the ore of the Champion contains enough silver to make it profitable for the leaching of that metal, it is done after the gold leach has been accomplished. The ore is shoveled from the gassing tubs into what are called the silver tubs, where it is leached with sodium hyposulphite solution. These tubs are the same size as the chlorine tubs, having similar false bottoms and filters. A continuous stream of the hypo solution is kept percolating through the ore from top to bottom, running into the silver precipitating vats, which are similar to the gold vats. Here the silver is precipitated as a sulphide with sodium sulphide.

Tests are made in the same manner as with the gold leach to ascertain when the leach is finished, and also when all the silver is precipitated. After the silver has settled the solution is drawn off and run into a storage tank, from where it is pumped into the supply tank, the same solution being used over and over, with an addition of fresh sodium hyposulphite from time to time, to keep it at the proper strength. The silver precipitate, like the copper, is dried and sold to the smelter.

Seven men constitute the force, including the foreman, three furnace men, one tub man (who attends to the gassing, leaching and precipitating) and two helpers.

Battery Frames.

(*Continued from page 45.*)

causing the rapid wear of both itself and the belting. Generally the pulleys are small, which, together with slow speed and increased tension, necessitates a heavier belt, much less economical in cost and subsequent wear than a lighter one. Even with small pulleys considerable grading becomes necessary for a belt-way, sometimes 8 feet deep.

All that applies to the "A" applies as well to the single-post frame. This intimate connection of battery and ore bin seems a detriment, as any settling or spreading of the bin timbers reacts upon and throws the battery frame out of line. Especially is this true where large quantities of wet, gougy ore are kept constantly in the bin. One case is recalled where the battery posts have long been out of line, to the rapid deterioration of battery and belting. Many mill builders advocate the entire independence of bin and frame.

Some frames seem to belong to no particular class, but are combinations of the few simpler forms, as the single-post with front brace. Often frames of this class differ greatly in the height of battery posts, length of braces, etc.

A design but seldom met with is that showing the cam shaft behind the battery posts. In a double mill, with batteries packed back to back and run from the same power, it becomes imperative to build one battery of this nature as shown in the Alaska-Treadwell and the Homestake mills.

Assaying of Gold and Silver.

NUMBER III—CONCLUDED.

By JACOB B. ECKFELDT, Assayer of the United States Mint at Philadelphia, Pa.

There are two methods of assaying silver—one known as the "dry" or "furnace" assay or "cupellation," the other the "wet" or "humid" assay, or the "volumetric process."

The method of furnace assay, or cupellation, already described for gold, when applied to silver, requires a nice regulation of temperature and so many extreme precautions, and is at best so liable to uncertainty of results, that it is now only used in a subsidiary way to furnish an approximate result, or a basis for the closer and more delicate manipulations of the humid assay.

The humid assay, with proper care and due attention to the condition of the liquids, may be regarded as a perfect process of analysis of silver both as respects accuracy and uniformity of results. The principle of the humid assay is that of determining the proportion of fine silver in an alloy by ascertaining the exact amount of a precipitant of known value required to eliminate the silver contained in a solution of a given weight of the alloy, so that the result is obtained without a final weighing of the precipitated silver. The necessary amount of the precipitating agent being found and the weight of the alloy known, the number of parts of silver in a thousand is deduced by calculation. For this purpose a solution of common salt, chloride of sodium, is used.

Standard Solutions.—Two solutions of different proportions are made; the first is known as the "normal solution," the second as the "decimal solution." The former begins, the latter finishes the operation.

The normal solution is prepared by taking the saturated solution of salt in water and adding water to it in the proportions, by weight, of 97.93 parts water, 2.07 parts saturated solution, together making 100.

By supposing an example, the successive steps of the assay process can be more readily followed and understood.

If the silver be of an unknown fineness, an "approximate" assay must first be made by cupellation or by a preliminary humid assay. If, however, as in the case of ingots, foreign coins, standard plate, or silver nearly fine, the fineness be supposable or approximately known, no previous assay is requisite.

Let us now suppose that the silver to be assayed be not far from .900 fine. The working weight will be thus determined: Divide 1000 by .900, and the result is 1.111; that is, we have a weight which will contain 1000 parts and will be precipitated by the fixed dose of normal solution.

For convenience in calculating, however, the table of weights increases and diminishes by fives; and as there is always more or less uncertainty about the supposed fineness, and also concerning the strength of the normal solution (owing to changes of temperature and evaporation of its water), and for another reason the next higher weight rather than the next lower weight is used, i. e., 1.115 in preference to 1.110. The object of this will appear more obvious hereafter.

We are now ready to weigh the silver. The balance in use is sensible to the tenth of a thousandth of a gram, to which point the result may be carried, if necessary, although it is not customary to report so closely.

With a pair of delicate forceps the assayer places upon the scales the weight 1.115 (i. e., one gram and one hundred and fifteen thousandths) of a gram, as previously determined. Upon the other side of the scale the granulations are added until the requisite amount is nearly obtained; the final adjustment is made by cuttings from the rolled slip.

The adjustment completed, the silver is poured from the pan through a funnel into a glass bottle of particular shape and size, then dissolved in, say, 10 grams nitric acid (26° Baume) by gentle heat.

It is during this process of solution that one of the especial advantages of the humid assay is reaped—in the detection of various foreign elements in the alloy, as gold, tin, copper, antimony, the sulphide of silver, etc., some of which dissolve with difficulty, others not at all, and all showing characteristic differences.

Precipitation by the normal solution is the next step in the operation.

The solution is contained in a large glass vase moderately elevated above the table. An india-rubber tube drops from a stop-cock at the bottom of the vase and lies loosely along the table, except about midway of its length, where it is intercepted by a smaller spigot; this is screwed down at a convenient working point for the right hand, the tube being free at the left.

The end of the tube is now slipped over the nozzle of a stationary, perpendicular pipette; with the right hand the table spigot is turned on, and the normal solution flows upward into the pipette, the top of which is drawn into a fine opening. Any overflow simply falls into a saucer surrounding the pipette. When full the flow is cut off, the finger placed upon the upper vent, and the tube withdrawn from the lower nozzle; we have thus an exact measurement of 100 cubic centimeters.

The assay bottle containing the solution of nitrate of silver is next placed under the pipette, the finger is removed at the top, and the solution falls into the bottle.

The immediate result of the operation is the formation of chloride of silver (also nitrate of soda), which is a white, flocculent substance, rendering the liquid in the bottle opaque. Other compounds, as the nitrates of copper and lead, etc., may remain in the solution, none of which seriously interferes with the assay, and some not at all.

It being necessary that the white precipitate should not thus pervade the liquid, the bottle is placed in a machine known as the "agitator," which gives it a violent agitation. This can, of course, be done by hand, but since several assays are made at once, the aid of steam saves both labor and time. The agitation is continued four or five minutes, whereby the precipitates curdle and quickly subside.

The bottle is next carried to the blackboard table—an upright slab of slate of the full length—and at the back of the table is marked off into ten divisions and numbered. If there be more than one assay in process, each bottle is placed opposite its respective number.

The agitation having caused the chloride to settle as a dense white precipitate at the bottom of the bottle, the liquid (nitrate of soda) remains transparent, though sometimes colored by the alloying metals.

It is to be understood that the charge of normal solution from the pipette is calculated to precipitate exactly one gram of pure silver; but as there has probably been either more or less than the exact 1000 parts of fine silver in the original weight of 1.115, we have yet to ascertain whether the normal solution has performed the whole work of the precipitation, or (in event of the alloy being baser than we had supposed) whether the precipitation has been overdone, i. e., whether an excess of salt remains in the bottle.

Accordingly the bottle is charged by a small hand pipette with a measure of the "decimal solution" of salt (previously described). This solution is only one-tenth as strong as the normal solution, and the single dose is, in bulk, the one-hundredth part of the large pipette, so that one dose of decimal solution precipitates only the one-thousandth part of a gram, i. e., one milligram. If the normal solution was not sufficient to precipitate all the silver, there will, upon allowing the decimal dose to run gently down the inside of the bottle, be a white cloud formed upon the surface of the liquid, the density of this cloud varying with the amount of silver still in solution.

The assayer now holds the bottle to the eye level and judges by the appearance of the cloud, as nearly as possible, how many more decimal doses will be required to precipitate all the silver remaining in solution.

Suppose the assayer now decides that three additional doses will finish the work of precipitation. He accordingly so charges the bottle, noting the charge upon the slate. The bottle is agitated again, and when the liquid is cleared it is tried as before with a decimal dose of salt water. If the judgment and application of doses have been correct, only a delicate trace will appear on the surface. This proves the assay complete.

It may be that the operation of dosing and agitating will have to be repeated several times, the assayer each time adding to the record upon the slate; but the process is always the same until the final trace is reached.

As the density of the normal solution may vary from day to day, or during the day, with the temperature and from other causes, assays of pure silver are made as a daily test of the state of the solution—in other words, an assay is made of the normal solution by silver of known fineness.

This assay is known as the "proof," and by it all other assays are adjusted, when the normal solution is proved by it to be at variance. Suppose, for example, our "proof silver" to have been weighed at 1 004. If the normal solution were exactly correct, it would precipitate the 1000 and leave the 4 to be precipitated by decimal doses. But supposing the proof assay is found to require only three and one-half additional doses; this shows the normal solution too strong by half a thousandth—in other words, every assay should have recorded for it a half-decimal dose more. This correction is accordingly made for each assay.

In our example three doses were required to finish the precipitation, but our proof has shown that another half should be added in the record since the normal solution was by so much too strong. The result upon the slate will then be three and one-half, instead of three.

The fineness of the silver is then obtained by the following proportion:

Weight.		*Normal Solution.*	*Decimal Solution.*		*Fine Silver.*		*Required Fineness.*
1.115	:	1.000	+3½	: :	1,000	:	.900

showing the silver to have been .900 fine. For the sake of expedition, however, tables are in use for the determination of both weight and fineness.

It may be that the original weight of the alloy was not sufficient to contain 1000 parts of pure silver, and, consequently, when the decimal charge is added no trace of chloride appears, or the same result would ensue from the assayer having overdosed the bottle with the decimal solution during the "working." In such cases a decimal solution of nitrate of silver is used.

This is the "descending," while the working by salt is the "ascending" assay. As the latter forms a clearer liquor after shaking, and for other reasons, too, the ascending mode is more satisfactory. It is now apparent why the greater (1.115) instead of the next smaller weight (1.110) is selected, thus allowing the assayer what is called "working room." It is necessary that the assayer in the above operation be correct in his eye judgment of the decimal dose required, since the slightest overdose precludes the appearance of the trace after the next agitation, and requires him to work back with the opposite solution.

It is the custom at the mint to work the one-fourth of a thousandth in silver, though in the higher grades of fineness the results can be carried on to the tenth, if necessary.

It sometimes happens that silver contains alloys which render the liquor in the bottle so obscure that the judgment of the cloud density is impeded and the final trace hardly discernible. This annoyance may be removed by the tedious and unsatisfactory operation of filtering after each agitation. But a quicker and better method is sometimes resorted to here, which consists in using 250 milligrams (one-fourth of a gram) of the alloy and adding fine silver to make up the full gram for precipitation. The result is obtained by substraction of the fine silver and multiplication for the full gram. Sometimes 500 parts and sometimes 1000 parts of alloy are used.

When silver contains sufficient gold to pay for its extraction a regular gold assay is made. If the gold be in large proportion the alloy must be rolled very thin (for the humid assay) and boiled in a stronger acid, or the metal may be fused with cadmium (and treated as described in the article on gold assaying) before proceeding with the humid assay. Duplicate assays are always made, to guard against error in the assay process, and also to detect any want of homogeneity in the mass of silver.

In the assay of ingots, five melts with their duplicates constitute a full "set." To prevent confusion and error, the bottles are all numbered, in sets, from 1 to 10, and are carried from place to place in a port-flagon made to hold ten. The assayer reports to the melter and refiner the fineness of each melt, condemning those which vary too far from the legal standard.

A Magnetic Mountain.

In the Arabian tales a story is told about a magnetic mountain which attracts irresistibly all ships, and when they come near extracts every particle of iron from them, even to the nails. Such a mountain exists in reality, although not quite as dangerous in its activity as the one mentioned in the oriental fairy tale. This island of Bornholm, in the Baltic, belonging to Denmark, consists almost entirely of magnetite, and its magnetic influence is very well known to the navigators of those waters, and also much feared by them, not on account of the possibility of its extracting the nails from their ships, but besause of its influence on the magnetic needles, which makes the steering of a ship almost impossible. This influence is felt even at a distance of miles, and when this island is sighted all mariners on the Baltic discontinue steering their course by the needle, but turn to the well known lighthouses and other holds to direct their course. Between Bornholm and the mainland there is a bank of rock under water which is very dangerous to navigation; because of it being constantly submerged vessels have been frequently wrecked at that point. The magnetic influence of that ore bank is so powerful that a magnetic needle suspended freely in a boat over the bank will point down, and if not disturbed will remain in a perfectly perpendicular line.

Alabama Gold Mines.

Before the Alabama Industrial and Scientific Society lately T. H. Aldrich gave an account of the work in which he has lately been engaged in preparing to mine and mill the gold-bearing quartz veins of Hog mountain, in Tallapoosa county. This is a low-grade ore, but it can be mined and milled at a very small cost, and as the quantity is very great the proposed operations are to be on a large scale. In connection with this paper, the discussion brought out the fact that the working of similar low-grade ores has been very profitably carried on for about a year in the Idaho district, in Clay county, and Mr. Aldrich predicts that a number of gold mining plants will soon be in successful operations in the State. The recent reports of the State Geological Survey have shown that low-grade gold ores occur in large quantity at several localities in Alabama, and, since the success of the operations at Idaho has been fully demonstrated, the attention of capitalists has been directed to this inviting field.

Mining Summary.

CALIFORNIA.

Amador.

Republican: The Bellweather, which has been under bond for the past two years, and worked a portion of that time on a scale far short of what the claim would justify, was surrendered into the hands of the owner, S. W. Bright, last week. He at once bonded it again to Messrs. Hepburn and Knapp, who were connected with the former company. It is held out that a new company is to be organized to work it.

Ledger: On the 19th of June sinking was resumed in the South Spring Hill shaft and from 3 to 5 feet per day have been made daily since. The old shaft was down 900 feet with a sump. The company proposes to sink to 500 feet deeper before taking out and milling ore. Their first level and prospecting will be done after 200 feet depth has been attained. John R. Tregloan is superintendent. At the same time work is being prosecuted on the Median and Talisman properties, which are in the same group and are owned in the most part by the same owners, all of Boston.

Butte.

(Special Correspondence).—Butte county, one may say, commences with Oroville, which, in a business sense, is headquarters for a large mountain section, extending even into Plumas county. Oroville has railroad connection with the Pacific and Atlantic lines, and stage lines for every mountain section of Butte, Plumas and portions of Yuba county. Nothing has revived "pioneer days" to my mind so much as the income and outgo of its many stages.

Butte county has long been known as a gold producer. In the early '50s she poured out vast sums of gold, as every gulch, ravine and river within its boundaries paid fabulous wages per day. Later on these washings gave way to gravel bank and drift mining, the latter being the dead river channels. Some of these channels produced immensely.

For the geologist there is no part of California more interesting, as a study, than the northern sections of Butte. It has been the center of great volcanic action. Within the distance of fifty miles from Magalia there are over thirty distinct craters of extinct volcanoes. At some points these dead rivers are covered with lava flows 500 feet thick. In other parts can be traced various stratas of lava, then layers of gravel, and upon this again another stratum of lava, and so on for some half a dozen of each. The Mining Bureau contains a bone of a mastodon taken from one of these mines, which lay below 500 feet of lava. There are many of these dead rivers in Butte county, and why there should be great riches in one or a few, and nothing in others, hardly looks reasonable. Drifting in the old dead rivers, like every other class of mining, requires capital and pluck. From gravel, at this time, a vast sum could be realized monthly, were it not for the debris question. It was in Butte, near Magalia, in the gravel, where was found the 54-pound gold nugget, the largest ever discovered in California.

In quartz mining Butte has been behind most other counties, yet there are quartz ledges, as lava does not cover the country like a blanket. About Forbestown there are a number of lodes. The mill of prominence of this section is the Gold Bank, having forty stamps, with all modern equipments, an up-to-date mill. About Enterprise are several smaller mills—in all, some fifteen or twenty stamps. There are several in other sections. The Banner quartz mine, some five miles from Oroville, was at one time a very large gold producer, and should be again with development and depth. The lack of development of the quartz lodes of Butte is really more prominent than in many of the mining counties of California.

ALMARIN B. PAUL, M. E.

Calaveras.

Chronicle: At the Eclipse gravel mine on Tunnel ridge an upraise has been made and the gravel encountered was it the bottom of the channel on the east rim. Present developments show the gravel deposit to be quite extensive and of a good quality, averaging $3 per carload. The gravel can be mined and milled for 50 cents per ton, and the capacity of the mill is 150 tons per twenty-four hours. There are twenty men employed under the superintendency of F. H. Hall.

El Dorado.

Nugget: Development work is being pushed ahead at the Bright Hope mine under the supervision of W. R. Wallace.

The Pocahontas mine has been purchased by J. F. Webb and P. A. Fusz, the latter president of the Grandite Mountain Mining Company of Montana. The first payment of $10,000 was made last week. The old workings are now down 400 feet and there are some tunnels. The present owners are cleaning out the old Burlingham workings. A large force of men will be employed and a mill erected soon.

Kern.

Randsburg *Miner*: C. C. Lane, superintendent of the Rand Mining Company, reports that for the month of May the mine product of ore was 113 tons, 370 pounds, which milled gave $5,170.70. The total mine expenses was $2820.22. Month's profit $2350 48. For the month of June the ore milled was 365 tons, 1536 pounds. Bullion produced 933 ounces, estimated value, $13,841.44. Total expenses of mining, milling, etc., $5926.51. Net profit for June, $7914.93.

The Wedge shaft has reached a depth of 335 feet, with the ledge looking as well as ever.

Twelve men are working on the Minnehaha, sinking a shaft and driving a tunnel.

Considerable excitement has resulted from the discovery of good placer ground on the flat between Randsburg and Goler. Enough is already know of the richness of the ground to insure a good field, for good wages can be made with the dry washer all over the placers from the surface of the ground, and many holes will be sunk that will pay to bedrock where the the best is to be found.

Nevada.

(Special Correspondence). —There are quite a few men here who are alive to the situation. They are joining forces and opening properties for the market. Capitalists are always ready to take up a developed mine, and Nevada county is alive in every direction, with the opening of new and rehabilitating of old mines.

On the Tomboy, three miles north of town, the shaft has reached 50 feet on a 16-inch ledge of rich ore, with a good percentage of high-grade sulphurets. A drift has been started on the 50-foot level. The property is owned by Hitchcock, Towle & Cleveland.

On the Searles, two and one-half miles from town, the shaft is down 40 feet, at which point the ledge is 18 inches. A mill test of the ore shows it to be very fair grade, such as will warrant the continuation of work, which the company will push to great depth. There are two claims—600x1500—in the property. It is owned by Buffington, Kirkham Bros., Cooper & Searles.

The Cadmus, one mile from town, has reached a depth of 430 feet, and the south drift on the ledge is 100 feet. The ledge is 2 feet and a good grade of ore. The property is owned by San Francisco people.

Hall & English began to-day to sink to greater depth the 50-foot shaft on the Bismarck. The ledge is from 18 to 24 inches and assays $12.

The Pioneer Reduction Works are doing a thriving business. Their assay office turns out considerable work, and the great smoke-stack shows that the fires are never dead, either by night or by day.

At the Mulligan Ranch gravel mine they have reached 600 feet with an incline shaft. The company expects to reach the channel within 200 feet. Their drift on the rim is 50 feet. The property is owned by Poolman & Hastings, and is near the Harmony and Delaware, both steady and rich producers.

The author of the saying, "What's the matter with the Father Lode of Nevada county?" is receiving compliments at all hands from mining men and newspapers, both, since his saying was first printed in the MINING AND SCIENTIFIC PRESS. There is more serious thought to this than one might at first accredit to it. The origin of the phrase rests with Fred Zeitler, superintendent of the Champion mine, near Nevada City.

Nevada City, July 12, '97.

(Special Correspondence). —The new life and activity displayed in mining in and about Grass Valley are bringing about an agreeable change in the prosperity of this city. New prospects are being developed, old and seemingly almost forgotten mines that were abandoned years ago at water level, are being reopened, capital is finding its way hither from the far East as well as from immediate home quarters, and from a hundred hills resounds the hum of the electric wheel and the dropping stamp.

The Omaha Consolidated (a corporation) has purchased 1300 feet adjoining the Omaha and Lone Jack. The entire property now comprises 4000x600 feet. The new shaft on the recently acquired property is 50 feet. The new hoisting works will be completed in about ten days, after which this shaft will be continued to a depth of 1700 feet. The shaft is on the vein, which will average 12 inches on a good grade of ore. The Omaha property has for years been milling $30 ore and paying good dividends.

The shaft on the Bullion has reached a depth of 840 feet. Levels at this point are run both way. The south drift is 140 feet, and at 400 feet it is expected to cut the old Irone vein, which (over twenty years ago) was very rich. The present works will be 300 feet lower than the old workings. Superintendent Mainhart is driving the work rapidly and expects ere long to have a richly paying property. The property is owned by Sacramento and San Francisco people. It comprises four claims.

The Diamond mine, situated between the Bullion and Osborn Hill, has been bonded to San Francisco parties, the principal among them being Mr. Widber, the City Treasurer. This property was abandoned at 200 feet over twenty years ago. The ore at that time was very rich, but at water level work ceased. Active development work will be started within a few weeks.

The Orleans (a San Francisco corporation formed by four people) is doing extensive development work. There are five shafts, the deepest being 800 feet, all averaging 500 feet. All the shafts are on the ledge, which has averaged 12 inches of high-grade rock. There is a 5-stamp mill used only for test work in the development of the property. This mine was opened in the early fifties and was very rich, but when the hard bar was reached, work ceased. The present shaft work went through the hard bar at the 700, where the ledge pitches from the wall at 32 degrees. The chute of rock is just beginning to be opened and the future of a great mine is assured. C. A. Brockington is the superintendent and co-owner. The Orleans is one mile southeast of town and adjoins the Empire on the south. J. F. L.

Grass Valley, July 10, '97.

Placer.

Record-Union: Near Sunny South on the Eureka, Felix Chappellet and his company have run a tunnel 2,100 feet and are now raising to strike the channel.

At the Centerville mine the gravel has been worked over 500 feet wide, and rim rock has not yet been encountered. Thus far the material is hauled out of the tunnel to the mill by horses, by the company is preparing to put in an electric plant to transport the gravel and light the town and mine.

The Sunny South, owned by the Hidden Treasure Company, has been pretty well worked out, though there are fifteen men working who have the mine under lease.

The Drummond mine, owned by C. F. Reed of Auburn, has been proven to have rich rock, and, to more systematically open it, a tunnel was started, and has been extended 600 feet. It is expected to tap the ledge in 60 feet farther. Mr. Reed has bonded the mine to Mr. Wiltsee, who will open the property on an extensive scale if the tunnel developments are satisfactory.

The Mayflower mine has a tunnel two miles long and a 20-stamp mill, which crushes 200 tons of gravel per day. It has paid regular dividends for years, and has levied no assessments in all that time. There are about seventy-five men employed there now. At present an upraise is being made in anticipation of finding an upper and unworked channel.

The Pioneer quartz mine, owned by a Boston company, has been worked by them for two years. The croppings of the ledge run down a steep mountain side and the ledge has been worked by a series of tunnels, one of which penetrates the hill 3000 feet. The ledge averages from 2 to 12 feet in width. There is a 20-stamp mill on the property. The company employs from thirty to seventy-five men. Jerry Sullivan is superintendent. Quite a rich strike has been recently reported in the mine.

The Golden River or Red Point drift mine at Pioneer was started by a French company with C. F. Hoffman as superintendent, about 1895. A tunnel was run 1800 feet before the channel was encountered. The same tunnel has been extended on the channel until it is now two miles long. The channel varies from 50 to 400 feet in width, averaging about 150 feet. The gravel is worked from 2 to 3 feet high. When Mr. Hoffman accepted a position to go to Siberia, J. A. Ferguson was appointed superintendent. There are sixty men employed at the mine.

Sentinel: A syndicate of English capitalists has purchased the Miner's Ditch property and claims of the Cedar Creek Company, owned by Gould & Doolittle and others, at Gold Run. J. E. Doolittle has been named for superintendent.

Supt. Fred S. Roumage, of the Horseshoe Bar Mining Company, states that they have reached bedrock at 36¼ feet. The gravel shows pay all the way down and the elevator is working well. More than forty men are employed.

In the Goding & Co. gravel claim at You Bet, while the miners were engaged in making an upraise from the 250 level, they cut into the channel and struck some fine-looking gravel.

L. E. Taylor and E. Atwell of Colfax are developing their placer mine near Emigrant Gap.

The Cash Rock Company are making extensive preparations to work the gravel in the river bed below Todd's valley. Electrical machinery will be used. A large force of men are employed building ditches and flumes and erecting mine buildings.

Plumas.

Independent: The Garnett Company has struck a channel of gravel in the lower tunnel of the North American mine on Gibsonville slope. Before the purchase of these properties by the present owners a tunnel 900 feet in length had been driven into the North American claim. The Garnett Company made an upraise of 30 feet therein and started a tunnel which reached good paying gravel when in 200 feet from the starting point.

Some months ago E. C. Robinson of this city bonded his mine in Granite basin, Plumas county, to a Chicago company for $100,000. The new owners put up a mill and drove the shaft down for some distance. The mill was started about twelve days ago, and the yield of gold thus far has been much better than was expected. So well pleased is the management that a new hoisting works will be erected and machine drills put into the mine.

At Granite Basin, Mr. Peppin has bonded the Plumas Quartz and Olive Quick extension of the Colwell ledge to Robert Blackwood of Minneapolis for $20,000. A tunnel 450 feet long taps the ledge, which is from 4 to 5 feet in thickness, with backs 50 feet in depth. Work upon the property is to begin at an early day.

The Robinson Company has a 15-stamp mill; at present five stamps only are in motion. Twenty men are employed and the company is arranging matters so that all the stamps in the mill will be kept at work.

Jolly & See are running five stamps on ore from a 5-foot ledge in the lower level of their mine, that is yielding good returns.

Shinn & Perkins are hauling ore from the Christie property, recently bonded to the Perkins mill, for reduction.

National-Bulletin: Dr. Welch has suspended hydraulic mining at the Joseph mine on Grizzly creek, owing to failure of the water supply. Late in the spring under adverse circumstance and at heavy expense the Doctor got machinery and supplies at the mine and fitted it up to work. The water season this year has been unusually short. The result of the cleanup, however, is very good.

At the Plumas Imperial hydraulic mine the mouth of the ancient channel formed by the breakaway into Rock creek was filled with a false bedrock, broken up and out of place, thus for quite a distance destroying what otherwise would have been a well-defined, permanent channel. During the latter part of June, this permanent channel was broken into and found to be entirely different in the character of the gravel from that previously mined, as well as in the nature of the bedrock. It will be necessary for Mr. Hazzard to run a bedrock tunnel to make a sluiceway under the mass of false bedrock near the break of the channel into Rock creek. To run this tunnel will require nearly a year's time.

G. P. Cornell has made arrangements whereby he will start work on the Arcadian mine.

Important development has been made in the Phœnix mine at the head of North canyon, near Greenville, owned by Firmstone & Richards. A 6-foot ledge of rich milling ore has been opened up.

Shasta.

Free Press: The London Gold Tunnel Company have awarded a contract to drive their tunnel at Mule mountain 265 feet and to fully equip the mine with machinery, drills, cars, tracks, etc., and to erect extra buildings, all for the sum of $10,000, the work to be completed before Nov. 1st, '96.

Keswick *Miner*: The Mountain Copper Company is putting in $4000 worth of machinery for a five-ton ice plant. They will also have a cold storage room 17x19 feet and 12 feet high. The company expects to erect forty new cottages for their employes. Nine thousand tons of copper ore in kilns three-quarters of a mile long is being roasted. The ore will burn three weeks before it is ready for the smelter. Yet this quantity of ore is only one-third of what is being treated about the smelters.

Sierra.

(Special Correspondence).—The El Dorado, nearly Alleghany, has two tunnels, one 300 ft. and the lower 400 ft., on a 3-foot ledge that averages $15 per ton; no sulphurets are saved. There is a stamp mill in operation. The property is owned by Lewis and the Fessler estate.

The W. F. Hanley & Co. gravel property has a main tunnel 2400 ft. which strikes the channel at 1500 ft. Additional tunnels amounting to 2400 ft. are all in pay gravel, which runs from 15 inches to 50 ft., and averages $1.50 per car by the sluicing method.

The Lucky Dog gravel property, 1½ miles west of town, taps the channel at 800 ft. The channel is 60 ft. wide. A mill will be erected soon. There are three additional properties, the Nellie Bly, the Page and the Sonntag, making a total of nearly 700 acres.

The South Fork uses a locomotive to haul its gravel, drawing 10 cars at a load. The North Fork Company uses mules, hauling 15 cars in a train.

The Young America had several shafts fifteen years ago, but water interfered. The gravel paid $8 to the man. The company is now running a bedrock tunnel which will reach the channel at 1200 ft. There are 250 acres in the claim. B. F. Derickson is the principal owner.

The Hope quartz mine, owned by a corporation known as the Minnesota Development Company, have a tunnel on the ledge at the north end 1000 ft. long, and on the south end the tunnel is 350 ft. The tunnels are 6½ ft. in the clear and provided with air piping. The sulphurets occur in large bunches and run $250 per ton. J. O. Jones is superintendent.

The Mabel Mertz gravel mine has a tunnel 526 ft. and is at the rim of the channel, and has been in pay gravel for 100 feet. There are 320 acres in the property.

Forest, July 10, '97.

Siskiyou.

Reporter: At Sawyer's Bar, as the result of a fifteen-ton crushing at the Jumbo, men have been put to work cutting timbers for a tramway.

Peters & Frazier have sunk a shaft 50 feet on their claim and report an encouraging strike.

The Gold Hill mine, one of the richest gravel mines on the river, has closed down for the season.

News: Wm. Chamberlin of the Mabel mine intends to start a force of men to work next week taking out ore.

The Gold Run mine, under the supervision of Danenbrink Bros., one of the best equipped and best managed mining properties in Siskiyou county, is a steady producer, with considerable good ore in sight.

Journal: Never before in the history of Siskiyou have the prospects for extensive mining operations been so bright as at present. Outside capital has been coming in of late, and in nearly every instance the investments have been successful, thereby encouraging others to do likewise. During the past year several immense plants have been introduced in the county, and their successful operation is causing the owners to enlarge these plants and introduce more extensive machinery. The output of gold last year was a little less than $1,000,000, but will probably be considerably larger this year. The rich mines of this county are not confined to one section, but are scattered all over the western portion of Siskiyou. They are found on the Klamath river, Salmon river, in Quartz valley, Oro Fino and numerous other sections. Quartz mining has also made a great stride during the past year, several mills having been erected, as well as numerous arrastras. At the present time there are more miners employed in Siskiyou than any other county in the State, the great majority of them working their own claims and putting the money they take out into circulation at home.

The owners of the Katie May mine, on Greenhorn, expect to take out a large amount of quartz. They have been running a tunnel the past few months, and will tap the ledge much lower down.

LeMay & Utne have again commenced work on their ledge near Yreka.

Trinity.

Journal: On East Fork all the old mines are being worked and new ones are being opened up and developed.

At the Yellowstone Mr. Skinner is taking out rock and crushing ore.

At the Enterprise and Lone Jack the company are running both mill and mine full blast.

At the North Star mine a force of men are at work developing the property and taking out ore. The mill is running steadily.

One of the most prominent of the new loca-

tions is that of Simpson, Given, Reed and Zuella. They have a 2 foot ledge of high-grade ore at the head of Newman gulch.

Hippler and Brown are doing development work on their locations and are showing up a good property.

Tuolumne.

Union-Democrat: At the Rawhide the shaft will reach the 1200-foot mark within a month. A station has been cut out at the 1100 level and drifting north and south commenced. The various underground workings continue to look fine, but the preponderance of rock reduced still comes from the stopes between the 10 and 9 and 9 and 8. The vein holds steadily at about 30 feet in width, with a splendid ore body. The forty stamps of the mill are crushing rock at the rate of 3000 tons per month.

At the App the main shaft is down to the 1000. Sinking will continue 50 feet more for a sump and then discontinued until stations are cut out and levels run. The shaft will be driven for the 1100 this summer. Rock for the mill of twenty stamps comes principally from the 700 and 800 levels, and is being reduced at the rate of 2000 tons monthly.

The Alabama is confining all work to sinking the new compartment shaft, which has reached a depth of 280 feet.

The Kanaka is worked by tunnels, of which there are six. In the lower one a shaft is being driven down. In four faces the rock is very good. The ten stamps of the mill are kept constantly at work. The ledges have a width of about 5 feet throughout.

Superintendent Chas. Shafer has a small force on the Punch Bowl, and the incline is now down about 185 feet and water has been struck; the ground is softening up. As the mine is where Table mountain is quite narrow, probably less than 100 feet more will break through the rim into the main channel.

At the Patterson prospecting is being done mostly on new ground north of the new workings. C. S. Long will visit the property during the week, when the selection of a power and mill location will be made.

West and Ricketts have a bond on the old Easton mine, near Cherokee, and have fourteen men at work. The property has shown plenty of good rock in the past.

The Grapevine mine, several months ago bonded to the Tuolumne Exploration and Development Co. by Charles Scofield, is showing up well, and next week a force of men will be put on.

NEVADA.

Eureka *Sentinel*: In White Pine work goes on in the Star and Grey Eagle mines as fast as circumstances will allow.

The North Mountain Company at Egan canyon is awaiting the arrival of the elevators. As soon as these are in place a force of men will be put to work.

The 5-stamp mill at the Ben Hur mine, Granite district, Steptoe valley, is in operation several days. The force in the mine taking out ore has been increased and a favorable showing is expected.

Pioche *Record*: The old leaching tailings from the R. & E. dump are being hauled to the Summit mill. They are used to facilitate percolation in the leaching now going on there of second grade Yuba ores. A contract has been let to haul over some 7000 tons.

Tuscarora *Times-Review*: Stamps are once more dropping in the Navajo mill after a long idleness, and will until cold weather puts a stop to it. At present it is being run as a concentrator, on some ore belonging to leasers, after which it will be worked on Nevada Queen ore and a lot of gold ore. Sperintendent McMahan states that a force of men will probably be put to work sufficient to keep things moving until cold weather. Large quantities of concentrating ore are known to exist in the Nevada Queen and Commonwealth and operations in those old time producers will undoubtedly result in some finds of high-grade ore such as has characterized them in the past, when silver was shipped by the ton from them. It is the belief of mining men that Tuscarora has a future if only depth is attained. No work has ever been done below 500 feet, though it is well known the ledges still go down.

OREGON.

Medford *Mail*: The Elk creek mining enthusiasm has revived somewhat this week, and there are a goodly number of people in the valley who are still pinning their faith to that country.

Grants Pass *Observer*: Conservative mining men who have visited the Elk creek district say that they would not be surprised if many good pay mines were found in that section. The surface showing would certainly indicate this.

Snowgoose Bros. & Treffren have their steam shovel and pumping plant in successful operation. The shovel and elevating feature of the plant are quite novel and worked after the manner of a hoist, delivering the gravel direct to an elevated sluice.

G. Dean will fit up a hydraulic mine on Pleasant creek.

D. Younglove, who owns placer mines on Louse creek, will soon commence the survey of a long ditch from Evans creek to his mines.

Blalock Bros. have ordered 1000 feet of 11-inch hydraulic pipe for their placer mine on upper Graves creek.

At Mount Reuben R. Jones has bonded his group of mines to Senator Jones of Nevada for $50,000, $3000 down.

C. D. Crane has secured a forty days option on the Oro Fino mine on Jump-off-Joe creek, and will commence work with five men immediately to sink the winze 70 feet deeper.

WASHINGTON.

Spokesman-Review: At Myers Falls the Niagara mine is now working a full force of six men, and the shaft is down over 70 feet. At this time the work is progressing in a full breast of ore at the bottom of the shaft.

D. W. Henley has purchased a half interest in the Spokane and Standard group of mines on Palmer mountain, in Okanogan county. The intention is to equip the stamp mill with three or four vanners as soon as possible to save the tailings for other treatment, and to work the mill day and night. Work will be started sinking on the 2-foot ledge right away, while simultaneously with the sinking a tunnel, to tap the ledge at a depth of about 300 feet, will be started for the purpose of draining the mine. As soon as the deal is closed an order will be placed for new hoisting and pumping machinery, and an air compressor plant will be put in.

BRITISH COLUMBIA.

(Special Correspondence).—Matters are improving in the mining world this week, as far as the coast proper is concerned. Trial smelter shipments have been made from several mines close to the mercantile centers, and have proven satisfactory.

The Blue Bell mine, on Frederic's Arm, a few miles north of Vancouver by water, has made its first shipment. The Blue Bell is an immense body of smelting ore, the vein being over 90 feet wide. An American expert, who recently examined the property, offered $25,000 for the prospect, which was refused.

The Providence claim, on Harrison lake, near the city of New Westminster, has made two shipments of ore. The last shipment returned $28 gross for sixty-five tons, which will pay well.

Claims are being worked on Lynn creek, a few miles across Burrard Inlet, Vancouver's harbor and opposite the city.

On Cayoosh creek, Lillooet district, the crusher for the Golden Cache mines is still in process of erection. Crushing will commence in less than sixty days.

At the Tinhorn, Fairview camp, Okanogan, thirty tons a day are being dumped. There are now some 700 or 800 feet of open cuts, tunnels and winze in this mine. Four tunnels are to be driven in the mountains. GOODMAN.

Vancouver, B. C., July 10th, '97.

The following are returns for 1897 up to July 2:

ORE EXPORTED.

	Tons.
From Slocan via Kaslo	12,651¾
From Slocan via Nakusp	4,080
From Rossland via Northport	8,951¾
From Rossland via Nelson	52
Total	25,745½

VALUES.

Through Nelson custom house	$1,405,231.40
Through Revelstoke (Nakusp)	424,836.65
Total value	$1,830,468.05
Average value per ton	71.083

PRODUCE OF SMELTERS.

	Tons.

Total	329

VALUE.

Value of matte and bullion	$182,165.30

IDAHO.

Spokesman-Review: Ever since the strike five years ago the mining industry of the Cœur d'Alenes has been under a cloud. A new era is now dawning. It probably began immediately after the Tiger-Poorman mills burned, on the 17th of March last year. The old ruins were not done smoking until the work of clearing the ground for a new structure was begun. The confidence of the Tiger-Poorman directors commanded the attention of other men of means, and the new mill was not finished before a controlling interest in the Helena and Frisco had been sold on a basis of about $1,000,000 for the mine, and work was suspended while mine and mill were put in shape to work on a much greater scale than ever. That work is now almost completed, at a cost for labor alone of more than $60,000, while the material, machinery and incidentals have amounted to at least twice as much more. Now, with a milling capacity of 800 tons per day, the mine has ore enough blocked out to keep the mill busy for three years. During that time, too, the Standard had completed a new tunnel half a mile long, which, together with the accessories and the improvements to the mill, had cost the company $100,000. In a smaller way, the owners of the Formosa had spent $10,000 in putting a mill on their property. This year five companies have been incorporated, and all have commenced work on their properties.

MONTANA.

Inter-Mountain: At the annual meeting of the Parrot Company directors it was decided to sink the Parrot shaft from the 1000 to the 1300-foot level and the work will be commenced at an early date. It was also decided to begin work on the Little Minah claim south of the Mountain Con. hoist. It is believed that by sinking to a depth of about 800 or 900 feet the property may be made a valuable producer.

Increased confidence in the ore deposits of Butte is shown by both the Parrot and Anaconda Companies, and in a few months the latter company will have one shaft near the 1800 foot mark.

There is a great deal of activity around the Norris district this season. The Revenue people have fifteen men employed on the Keller property, upon which they expect to do a great deal of work.

The Little Kid mine, near Bald mountain, was closed down owing to the breaking down of the roller mill. It is understood that the Minneapolis company operating the mine will at once begin the erection of a large mill to treat the ore.

The Rough and Ready 5-stamp mill was started up this week on ore from the mine. The company has a 4-foot body of fair grade ore in sight.

The new mill for the Mayflower group of mines, near Norris, has been ordered in Denver and will be in operation within ninety days.

UTAH.

Salt Lake *Tribune*: At Park City, now that the Marsac mill has started up, it will continue to run steadily. When the mill closed down last March but ten stamps were working, now thirty stamps are pounding the ore. The Daly mine, which supplies the Marsac with ore, has abundance of ore in the workings.

COLORADO.

Denver *Republican*: At Cripple Creek Anstie & Von Hemert have opened the C. O. D. chute in the fifth level at 400 feet depth, and are breaking rich ore in driving the work. A representative of the French stockholders is now in camp making an examination on which the future condition of the mine will be based. The lessees have been making steady production with a small force for the four months of their lease, and have established that the C. O. D. was not a worked-out mine when the directors ordered the work to stop.

Better ore than the Favorite has taken out for months is now being broken in the 200-foot level from the company's shaft. The shaft has been straightened and retimbered and now has a depth of 380 feet.

The Proper Company has found sufficient encouragement in the new shaft sunk on Globe hill to warrant it in putting on a steam plant and pushing the shaft down from its present depth of 50 feet.

The Newell tunnel into Grouse mountain has reached 340 feet and is nearing the big dyke along which values are expected. Several small stringers have been cut in its progress.

A Leadville syndicate is making an examination of the Moose on Raven hill, with a view to taking hold of it under a long-time lease. Much prospecting is now in progress on both sides of Eclipse gulch from the Moose to the Sheriff.

The station for the eighth level on the Buena Vista is about completed and a crosscut will be started in a few days for the vein, 75 feet away. The Lee shaft will rest at its present depth of 600 feet. It will require another month for the Isabella Company to gain benefit from the new level, but after that the mine should be again running at the usual production. Last month the output was 1000 tons of the usual grades.

Work on the Anaconda was suspended on the 1st inst., but will be resumed under the management of N. H. Cone, with J. Mullen as superintendent.

The Brakey & Conley lease on the El Reno at 80 feet has a vein 20 inches wide that shows free gold in abundance.

The lease of Caley & Reese on the Santa Rita has expired and the company will take charge of the property. C. Conant will be superintendent. The Santa Rita shaft is now 250 feet deep and the company will resume sinking at once.

The Tom Collins lease on the west end of the Gold King on Gold hill, south of the Anchoria-Leland, is looking well, and the property will soon be in shape to make heavy production.

The ore shipped from the Union Company's mine, the Orpha May, during the week closed was five broad gauge cars, four of which contained smelting ore, the fifth being a mill grade.

At St. Elmo the St. Elmo Recovery Company are pushing their works, with W. A. Stevens as manager, and will shortly have their cyanide plant in operation, with a certainty of 5000 tons of tailings from the Romley and Pawnee mills, which are settled in a dam just above the mill site.

The Quincy Mining Company have leased their claims to parties who will put up a mill on the claims and work the property.

H. M. Hogg, owner of the H. M. H. group on upper Bear creek, has recently let a contract for the erection of a 5-stamp mill.

In the next few days the Pulaski mill, Bridal Veil basin, will be in operation, treating ore from the Pulaski group of mines, owned by the Pulaski Mining Company, composed of Chicago capitalists.

At Telluride the Columbia-Menona 30-stamp mill is now turning out from ten to fifteen tons of concentrates daily, which is yielding very satisfactory returns at the smelters. The product is carrying gold, silver and lead. There are over 100 men employed in and around the mine and mill. Superintendent A. H. Brown is pushing every kind of work.

The owners of the Enterprise mine at Red Mountain, who have had a force of men developing the property all the past winter, commenced shipments from it a few days ago to the smelters.

On the Tomboy the mill is treating from 150 to 175 tons of ore daily, which on an average runs $20 on the plates by amalgamation and in the concentrates, and yields from 140 to 150 tons of tailings. Superintendent H. B. Adsit is having an 80 H. P. boiler and engine installed to supply power for a large compound duplex air compressor. After this machinery has been put in place the work of driving east and west drifts from the intersection of the mill tunnel crosscut, which recently cut the Tomboy lead 450 feet below the lowest of the upper workings, will be expedited, and the immense areas of ore between the intersection and the upper workings blocked out. The plant recently erected by J. W. Farwell below the Tomboy mill, for the treatment of the tailings coming from this mill, is about ready to be put in operation. The tailings assay from $4 to $7.50 in gold per ton.

On the Occidental mine, under lease and bond to Mr. Farwell, a force of fifteen men is engaged in exploitation work.

At Leadville at the present time there is a great deal of mining being done by lessees. The leasing system has been a boon to the camp, and especially so during the past few years, since silver fell so. In many cases where owners, as companies, have been unable to work their properties lessees have conducted developments, and have in most cases made a good living out of the work and in many instances have made a snug little sum out of it.

On the Leadville & Chicago Gold Mining Company's property sinking is to be commenced in a few days. The shaft on this property is already down some 200 feet and will be sunk to whatever depth is necessary.

It is understood that just as soon as the down-town pumps get well under way in their drainage work the Weber shaft will be started up and the shaft sent down to the contact.

At Ouray shipments of ore in car lots during the month of June amounted to 175 cars.

The U. S. is being worked by T. F. Walsh & Co., and ore has been sent down daily for shipment.

The Imogene basin is turning out its proportion of rich ore, and the average number of cars has run up to fifteen per week.

The Guston is shipping fifteen cars per week to the smelter.

The Monument mine, near Camp Bird, which is being operated by Dr. Henderson and partners, has struck a good pay streak of gray copper and brittle silver.

In Gilpin county J. Collins has taken a lease and bond on the Center claim, in Illinois Central district. The shaft has been unwatered, cleaned out and retimbered to a depth of 50 feet. The bottom shows a 5-foot vein, with considerable iron streaks in it.

At the Sleepy Hollow mine sinking was stopped this week at a depth of 800 feet, a lift of 100 feet having been sunk on the last contract. Drifts have been started east and west at that depth, the bottom of the shaft showing 18 inches of crevice matter, from which shipments were made while sinking. This mine ships about forty tons of ore a day, and is giving employment to about forty men. Leasers are working in the upper levels.

H. P. Lowe of Denver, who has sold the Topeka group of mines to Eastern parties for $160,000, is making arrangements for more extensive operations on these properties.

The Blair Gold Mining Company is operating the Blair property, in Lake district, and have eight men at work on development. The shaft shows improvement as depth is gained, and they have also opened up a 2-foot smelting pay streak of ore in driving the east 100-foot level.

Sinking operations were commenced last week at the Nugget mine, in Illinois Central district. The depth at that time was 130 feet, and the company intends to sink 300 feet deeper.

NEW MEXICO.

Denver *Republican*: In the Cochiti district outside of the six or eight big shippers, who send out nothing less than $40 ore, the miners of that district complain greatly over the lack of milling facilities.

A number of new and important mineral finds are reported, the most noteworthy being in the Lone Star, owned by Denver and Telluride parties, where in running an upraise they blocked out a solid body of about 400 tons of ore.

The Washington mine largely increased its working force yesterday and is to vie with the Lone Star as the heaviest shipper in camp.

In the Albermarle the main shaft is down 125 feet with numerous drifts and crosscuts. This is the property on which Howell Hines, the Cleveland, O., millionaire, has a bond for $125,000, which expires next month. He will certainly take the mine, and it is expected then that the Chociti district will not long be without a big mill.

In Grant county all the camps are flourishing. Both the lode and placer claims are being actively worked and the producers of lead are especially active now since it is pretty well understood that Congress is going to raise the duty 1½ cents per pound.

At Hopewell work has begun on the Red Jacket and Mineral Point tunnels. The new cyanide plant will get the bulk of its ores for treatment from these two mines.

Two shifts now push the work on the Iron Mountain tunnel. Superintendent Pace aims to cut a 4-foot surface vein at about 250 feet depth.

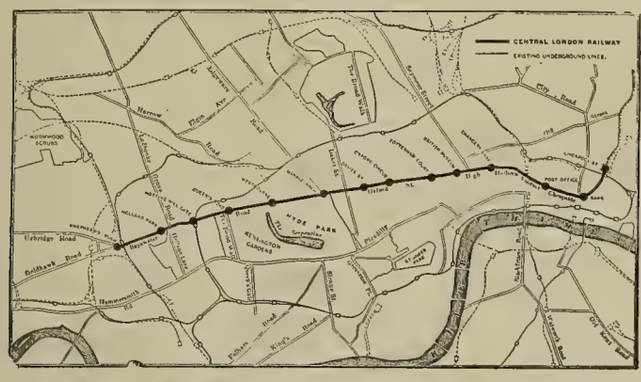
The Freeport, Cinnabar, Buckhorn and other tunnels are finding first-class ore and this has given a stimulus to the whole camp.

Electrical Progress.

American Electrical Equipment in London.

The most recent addition to the system of underground railways with which London is provided and the most important of all the present undertakings of a similar character in the world—the Central London Railway (underground) has an especial interest for Americans, due to the fact that the entire system of electrical equipment will be American. With the exception of the elevators the entire electrical contract has been assumed by the British Thomson Houston Co., Ltd., representing in Great Britain the General Electric Co. of Schenectady, while the elevator contract has been secured by F. J. Sprague of New York.

The road, laid in two deep subway tunnels, stretches through the very center of the great commercial district of the city and follows the line of greatest traffic in London. At this point crossing is a perilous task, and the railroad company is constructing a series of subways immediately below the surface for the convenience of pedestrians and as approaches to its own station below. From this central depot will radiate five underground tunnels, some eighty-five feet below the surface, each feeding a separate and



MAP SHOWING THE CENTRAL LONDON RAILWAY, (UNDERGROUND).

equally populous district of the great agglomeration known as London. The construction of the road itself has been carried out by the Electric Traction Company, which has also financed it. It is this company that has made the contracts with the British Thomson Houston Company, and which will turn over the road fully equipped and in working order to the Central London Underground Railway Co. ready for operation. Three years after the necessary parliamentary act was passed in 1893, the actual work of building was begun. Vertical shafts were driven at six different points to a depth of between 60 and 70 feet, and the tunneling was begun in four tunnels at once, two running in each direction from the shaft. At each of the stations were driven two shafts 23 feet in diameter and 87 feet deep, and one 18 feet in diameter and 76 feet deep—the two former containing two ingress and two exit elevators, and the smaller two spiral stairways, one for ascending, the other for descending passengers. The shafts are built up of cast-iron plates 1⅛ inch thick and 4½ inches in the flanges. All crevices in the back of the plates are filled with hydraulic lime grout injected under pressure. The glazed white brick passages leading from the bottom of the shafts to the stations are 8 feet 3 inches wide on the entrance side. On the exit side, where crowds might collect in front of the elevators, they are 13 feet wide. At the stations the widened tunnel is 21 feet in diameter and 375 feet long. The main tunnels are each 11 feet 6 inches in diameter, and are practically steel tubes driven forward through the clay. The plates used to line these tunnels are ⅜-inch thick, with flanges 4 inches deep. The shield for driving the small tunnels was 12 feet 8 inches in diameter and was pushed forward by six hydraulic rams giving a pressure of 230 tons. For driving the station tunnels the shield was 23 feet 8 inches in diameter and was pushed forward by twenty-two rams giving pressure of 840 tons.

Each tunnel will contain one track, one tunnel carrying the east-bound trains, the other the west-bound trains.

In laying the road bed the best modern steam railway practice has been followed. The steel rails weigh 100 pounds to the yard and are laid upon heavy cross ties. The system of contact will be the third rail, with the contact rail placed between the service rails of the track and insulated. The conductors will be fed at intervals from a copper feeder cable. This feeding will be controlled from the signal boxes and the operator will be able to cut out any section of the line when necessary. This method of contact is similar to that employed so successfully by the General Electric Co. in the installations on the East Weymouth, Nantasket Beach and Berlin-Hartford branches of the New York, New Haven and Hartford Railroad. The method of traction, however, will differ radically from that used on the branches above mentioned. Instead of passenger-carrying motor cars, with the motors mounted on the forward axle, locomotives similar in appearance to those used on the Belt Line Tunnel service of the Baltimore and Ohio will be used to haul the trains. The reason for this lies in the fact that the tunnel is only 11½ feet in diameter and that the bottom of the tunnel must accommodate the road bed. This materially reduces the clearance. The motors require to be suspended between 30-inch wheels, at least, to give the necessary clearance between them and the ground, and this fact has brought about the locomotive in place of the passenger motor-car.

The total length of the road is six and one-half miles, or thirteen miles of single track. There will be fourteen stations, including the termini. In designing the line a decided departure has been made in the arrangement of the station approaches. As the railway company is not embarrassed by any considerations of grade, as in the case of surface railroads, the plan was adopted of making the road act as an auxiliary to the operation of the trains as well as merely to carry them. On each side of the station is a 3 per cent gradient rising on the approaching side and falling to the level of the road on the departing side. This unique method gives a retarding effect to all trains approaching the stations equivalent to the application of considerable braking power, while materially aiding in the acceleration of all trains as they leave the platforms. Furthermore, the saving in power necessary to secure the requisite rapid acceleration is by the adoption of this plan calculated to amount to about 33 per cent.

The schedule speed of the trains will be fourteen and one-half miles an hour, with stops at each station of twenty seconds. The trains will be run at first under a headway of two and one-half minutes, which will be reduced as soon as the traffic demands, to a headway of two minutes. The generating station will be located in the open air at the extreme western end of the line near Shepard's Bush station. In building this the most modern American methods will be followed. The steam will be supplied from Babcock & Wilcox boilers, and the engines, of which there will be six, will be horizontal Allis machines, each of 1300 H. P.

The electrical system adopted is the three-phase alternating high-voltage primary, with reducing transformers and rotary converters, similar in general principle to that installed successfully by the General Electric Company for the roads between Lowell, Mass., and Nashua, N. H., and at Portland, Or., between Niagara Falls and Buffalo, and on the line between Dublin and Dalkey in Ireland.

The dynamos, of which there will be six, will each be directly driven by its own engine. These dynamos are of the newly developed rotating field and stationary armature type. Each will have a capacity of 850 kilowatts. The speed of revolution will be 94, the frequency 25 cycles, and the initial voltage 5000 volts. The total capacity of the power station will be 5100 kilowatts or 6800 H. P.

From the switchboard the current is carried to the converter substations, of which there are four. Two of these will contain seven step-down static transformers, six for service and one in reserve, each of 300 kilowatts capacity, and two rotary converters, each of 900 kilowatts capacity. The other two stations will contain four 300-kilowatt static transformers and one 900-kilowatt rotary converter. In the transformers the voltage of the current will be reduced from 5000 volts to 330 volts alternating, at which pressure it will enter the alternating side of the rotary converters, issuing from the commutator side direct railway current at 500 volts. The spare transformers mentioned above will be put into service when the headway of the trains is reduced. The static transformers are of the air-blast type, the windings being cooled by air forced through them by a blower. The rotary converters will be similar in construction to those used at Niagara, Buffalo and Nashua.

The use of the substation method of electrical distribution ensures a uniform pressure throughout the entire length of the line. Fluctuation, therefore, which would materially interfere with the lighting of the station and trains, is reduced to a minimum. The limit of variation fixed by the Board of Trade, to the rules of which department all electrical installations in Great Britain must accord, is ten volts. With the method adopted in this installation, the variation in pressure will not exceed three volts.

The locomotives will number thirty-five. Each will consist of a sheet-iron cab containing the controller, indicating instruments, air brake, pump and controller, sand boxes, etc., mounted upon a locomotive truck. The motors have been especially designed for this work. They are of the gearless type and, according to the new system of motor nomenclature adopted by the General Electric Company, are known as the G. E. 56. Four of these motors will be mounted on each locomotive, one to each axle, the total draw-bar pull being 14,000 pounds. The controllers will be of the series parallel type arranged for four motors. Each controller will embody the magnetic blow-out principle.

The weight of each locomotive will be thirty-five tons of 2240 pounds. The trains will be made up of seven cars, weighing when loaded 105 tons additional, giving a total train weight of 140 long tons. The seating capacity is calculated at 336 persons.

Access to and exit from the stations will be effected by means of powerful high-speed elevators. These will also be of American manufacture and will be built by the Sprague Electric Elevator Co. of New York. The elevators will be forty-nine in number, each with a seating capacity of 15,000 pounds, or about 100 passengers per trip. The speed of elevation will be about 150 feet per minute. These elevators will be of the double-drum type, similar to those built for the War Department at Washington but of much higher carrying capacity.

It is estimated that the number of passengers that this road will carry per annum is 48,000,000, which, at an average fare of 4 cents, will give an ample return to ensure dividends upon the capital stock.

Scientific Progress.

Molecular Physics of Cast Iron.

The committee of the Franklin Institute, in recommending the reward of the John Scott Legacy premium and medal to Alex. E. Outerbridge for his investigations on this subject, give in the journal of the Institute the following abstract of his paper and their conclusions:

These investigations have their origin in the observation made by the author that certain test bars of cast iron exhibited unexpected deviations from the strength which they were expected to exhibit. The only assignable cause for the abnormal (increased) strength of these pieces, which came to light in the examination of the facts of the case, was the fact that these specimens, contrary to the usual custom, had, previous to testing, been cleaned in a tumbling barrel.

The outcome of these observations was a carefully conducted series of experiments to determine the influence of vibration on cast iron. Experiments with a number of test bars cast from one pattern and one runner, some cleaned in the tumbling barrel and others with a wire brush, showed that those which had been subjected to concussion in the mill were from 10 to 15 per cent stronger than the others.

It occurred to the author that this increase in strength might be due to the "mobility of cast iron at ordinary temperatures when subjected to repeated shocks." To test the correctness of this hypothesis, a number of newly cast test bars were subjected to 3000 taps from a hammer upon one end. When these were compared for strength with other untreated bars from the same set, they showed the same proportionate increase of strength as had been observed with the bars cleaned in the tumbler. Numerous other experiments confirmed the fact that a substantial increase of strength, amounting in some cases to as much as 35 or 40 per cent, was exhibited by specimens of cast iron when subjected to preliminary repeated shocks.

Mr. Outerbridge has formulated the results of his scientific study of these phenomena in the statement that the molecules of cast iron are capable of movement without the necessity of heating the mass (as in ordinary annealing) and that, by the methods above described, a species of "molecular annealing may be effected in cast iron at the ordinary temperature, which will release the strains in the castings, precisely as does annealing by slow cooling in heated ovens or pits."

The report finds that, while it has long been known that a certain molecular change takes place in cast iron in the course of time, and that this change tends to relieve the internal strains and render the casting tougher, Mr. Outerbridge has been the first to make a careful study of the phenomena and to note that this change may be hastened by impact, and the whole effect produced in a short time.

One of the most difficult problems connected with the construction of the proposed tunnel under the Simplon range in the Alps is that of keeping down the temperature. The new tunnel will run 7000 feet beneath the summit of Monte Leone, and it is anticipated that the temperature will be 104° Fahr. During the digging of the St. Gothard tunnel the temperature rose to 88°. The heat affected the health of the workmen, more than half of whom were attacked by disease. The still more intense heat to be encountered in the Simplon tunnel can only be reduced by a careful system of ventilation.

Dr. D. K. Tuttle, melter and refiner at the U. S. Mint in Philadelphia, has

given an account of an examination he had been officially called on to make in connection with an alleged discovery of a process of transmuting base metal into gold. The investigation proved the fallacy of the alleged discovery, but disclosed the interesting circumstance that practically all the product sold as "pure" antimony by many chemical houses contains distinct traces of gold.

Improvements in Sterilization.

The completeness with which disease germs may be destroyed by the action of heat is well known, and many forms of apparatus have been devised for use in the convenient subjecting of food constituents either to the boiling pot or, in the system of pasteurization, to a temperature of 75° C. for a definite period of time. It has been found, however, that with many substances, such as milk, beer, wines, and others, the operation of sterilization partakes of the nature of cooking, imparting a peculiar taste, and sometimes materially changing the properties to an undesirable extent.

In a note recently presented to the Academy of Sciences by M. Duclaux, the process of M. Kuhn is described as successfully removing this objectionable feature of sterilization in a very simple manner. The principle consists merely in subjecting the liquid to be sterilized to the desired temperature in a closed vessel under high pressure and out of contact with air. The apparatus is equally simple, the sterilizer being a steel tube, silvered within, and surrounded by a steam or water jacket formed of a second cylinder of slightly larger dimensions. Suitable connections and stop cocks are provided, as well as thermometers and pressure gauges, and the apparatus is mounted so that it can be revolved by turning a crank.

The principle of the method is explained in the following manner: The cylinder being entirely filled with the liquid, there is no room left for expansion. As the temperature rises, the attempted dilatation of the milk, being restrained by the confined space, causes a marked increase in pressure, which, for the temperatures of pasteurization or sterilization, will reach five to six atmospheres. At such pressures the gaseous and aromatic constituents are unable to separate from the liquid. After the sterilization has been accomplished the cooling under pressure causes these same constituents, which may have become temporarily dissociated, to be entirely reabsorbed, thus delivering the liquid in practically the same condition as before, except for the destruction of the germs by the heat.

It is believed that this apparatus will be of especial value in the production of wines, since it enables the fermentation to be arrested at any desired stage, and, when used in connection with microbiological investigations, it should be most valuable.

THE most recent proposal in connection with the use of aceylene in laboratories is that made by H. G. Soderbaum in the *Berichte*. It appears that the gas can be employed for the quantitative precipitation of copper in ammoniacal solution, and for its separation from metals like zinc, which are not precipitated by ammonia. Acetylene possesses the great advantage over sulphuretted hydrogen, which is usually employed for this purpose, that it yields a precipitate which can be filtered and washed very rapidly, and which does not easily become oxidized and pass into solution. The washed precipitate is finally decomposed by dilute nitric acid, the solution filtered and evaporated to dryness, and the residue ignited and weighed as oxide.

FOR detecting carbon monoxide in the air of mines, M. A. Mermet, a French authority, finds a dilute solution of potassium permanganate, containing a little nitric acid, highly efficient, the effect being to decolorize the permanganate solution. The reaction goes on more rapidly when the solution also contains silver nitrate, one part of carbonic oxide per 500 to 5000 parts of air decolorizing the liquid in from one to twenty-four hours.

AT a meeting of the Committee on Mining and Metallurgy of the Franklin Institute, H. B. C. Nitze of Bethlehem, Pa., publishes a paper "On Monazite," giving its chemical and mineralogical characteristics, occurrence (chiefly in North Carolina and Brazil) and industrial application for manufacturing the rare earths used in the production of the mantles for the Welsbach light. The interesting fact was noted that the annual production of this once so-called rare mineral now exceeds 1,000,000 pounds. The finding of the mineral naturally concentrated in seabeach deposits on certain portions of the Brazilian coast, whence it is shipped as ballast, has so greatly reduced the price that the mining of the mineral in North Carolina has been abandoned as unprofitable.

IT is a fact that, notwithstanding all that has been accomplished in the field of electrical discovery, the attitude of the public mind toward electric research is that of confident expectation. This attitude is maintained by the frequent announcement of discoveries—results of experimental investigations—which, while not in themselves revolutionary, or, so far as present indications go, even calculated to initiate any important change in current practice, are yet of a character to show how narrow is the margin of the field already cultivated, and how broad and rich is that portion yet untilled.—Engineering Magazine.

LORD KELVIN, in a recent address upon the earth as an abode fitted for life, has summed up the latest evidence regarding this point, and was able to say with confidence that the earth solidified between 20,000,000 and 30,000,000 years ago. The latest estimate of the time required for the formation of all strata since the beginning of the Cambrian rocks is 17,000,000 years. Lord Kelvin declares that the earth could not have been habitable more than 30,000,000 years.

MR. C. J. REED, in the *American Electrician*, discusses the subject of the direct production of electricity from fuel, with incidental reference to the recently mooted processes of Jacques and Case. The author holds that the practical solution of the problem will depend on the discovery of new chemical elements, having properties radically different from those of any known substances.

Mechanical Progress.

Evolution in Mechanics.

When railroads were first started in England, the carriages for personal transportation were constructed by making a long body frame, mounted upon trucks, and placing on it three stage-coach bodies, all being well bolted together. The traveling public was thus given accommodations which, in interior arrangements at least, resembled very closely those to which they had been accustomed, and, after some demurring, the new order of things was gradually accepted. As the art of car building progressed, however, it was soon found much better to construct the whole affair as one piece of work, but the influence of custom was so strong that the British railway carriage is still built on the stagecoach model, and it is to this cause, rather than to any other, that the compartment system owes its being. Although the carriage is practically built as one vehicle, it is ornamented on the outside by mouldings, curved to follow the old lines of the stagecoach body, and even when these mouldings are omitted in the lower-class carriages, curved stripes of paint are put on to tell the story of the evolution of the car from the coach.

But there are other examples of the absurdity of imitating in form a construction of which the need no longer exists. The motor carriage is already in evidence, and it, too, bears the ear marks of its horsy, though horseless, origin. One of the latest forms of these carriages bear all over indications of the existence of the horse that isn't there. In front there is a high leather dashboard to protect the riders against the splashing from the heels of the absent animal, while the finish of the heavy trimmings could only have emanated from the establishment of a builder of carriages made for horses, and the whole vehicle looks as if it ought to have a pair of lively animals in front of it to make it look complete. It is, indeed, difficult to get rid of old ideas, even when the necessity of their presence is absent; but the mental inertia which makes such things possible, is probably inherent in human nature, and its elimination requires a long course of education and experience.—Cassier's Magazine.

The Uses of Exhaust Steam.

Exhaust steam can be utilized in various ways. Condensed and separated from oily matters, it becomes a comparatively pure material for the manufacture of artificial ice. The purest ice to be obtained in our city markets is made of water condensed from exhaust steam. Water so condensed and separated from oily matter is also the best obtainable for boiler feed. The use of surface-condensers not only effects an economy of fuel, but supplies pure water for steam boilers in situations where the water is of such quality as otherwise not to permit its use for generating steam. Another use for exhaust steam is for heating buildings. On this use, Mr. Willard Hatch has made some observations, which will be of use to those contemplating such an application. He assumes a building of definite proportions, using a given amount of steam power, and then considers the value of the exhaust steam for the two purposes of producing an increase of power by the use of a condenser, and the simultaneous heating of buildings, both of which applications may be made together during a considerable part of the year, in climates wherein the artifical heating of buildings is required. What the author calls incident heat in buildings—*i. e.*, heat developed mechanically, that derived from the persons of workmen, and that derived from gas jets—is shown to be an important factor in warming factories and workshops.—Engineering Magazine.

The Longest Bridges.

The longest bridge in the world is that over the Tay, in Scotland, which is 3,200 meters=9,696 feet long; and the next longest is also in Great Britain, being that over the Firth of Forth, 2,394 meters=5,552 feet in length. The following table gives, in meters and in feet, the lengths of the principal bridges in various countries:

	Meters.	*Feet.*
Tay, Great Britain	3,200	9,696
Forth, Great Britain	2 394	5,562
Moerdyck, Holland	1,470	4 820
Volga, Russia	1,438	4,715
Weichsel, Germany	1,325	4,340
Thoen, Germany	1,272	4,172
Grandenz (Elbe), Germany	1,092	3,580
Brooklyn, United States	488	1,601

The greatest single span of the Forth bridge is 521 meters=1,725 feet; of the Elbe bridge, 420 meters=1,378 feet; of the East River bridge, 488 meters=1,610 feet.

Freezing Check Valve.

A leaky check valve has recently been patented. In some instances it happens that the pipe beyond the check valve becomes partially filled with water. With a lifting check rising vertically there is the same tendency to trap water up to the level of the valve seat that there is in the common globe valve. This water frequently freezes, and to overcome this difficulty this inventor drills a hole through the partition separating the two sides of the valve, so as to let the warm water from the boiler keep the water warm in the space beyond, making purposely a leaky check valve.

The Rise in Steam Pressures.

The most prominent condition affecting all engines, whether marine, locomotive, or stationary, is a more general employment or higher steam pressure. This increase of pressure has been marked within the last fifteen or twenty years. In marine practice it has risen in that time from 60 to 150 pounds, and, in exceptional cases recently, it has reached 270 pounds. In locomotive practice it has increased from 125 to nearly 200 pounds. In stationary practice 150 pounds are not uncommon, and 200 pounds are occasionally employed, although in that field 100 pounds are a ruling average. In the future this average will increase, as the more general introduction of watertube boilers makes it practicable, and because it is a necessity if electrical apparatus is to be operated economically.

THE most conspicuous application of oil burning in Great Britain is that on the Great Eastern Railway, as perfected by Mr. James Holden. There are on the Great Eastern Railway 37 locomotives, 13 stationary boilers, and four furnaces fitted with liquid fuel firing at present. In the case of the locomotives, the oil fuel is carried in two cylindrical tanks placed on the tender, leaving the central space perfectly free to hold coal as before. Suitable provision is made for warming the oil in these tanks in the winter. From these tanks the oil is carried by pipes to the engine foot plate, where, after passing through the necessary valves, it is sprayed into the firebox by the injectors.

MORE than 500,000 sewing machines are made in this country annually, which is 90 per cent of the production of the world. Nearly 100,000 persons in one way and another make their living in this country out of sewing machines. In no branch of manufactures has a greater revolution been wrought by the sewing machine than in boots and shoes. In 1861 the first machine for sewing on soles was put into operation and a royalty of two cents on shoes exacted. By the aid of machines 350,000,000 pairs of shoes had been made up to 1877 in the United States, and probably an equal or greater amount in Europe.

ACCORDING to a calculation worked out by the *Revue Scientifique* of Paris, the proportion of paying load to total displacement of a steamship in 1840 was only 10 per cent,—that is, the hull, engines and fuel carried formed 90 per cent of the weight of the vessel. In 1850 the paying load had risen to 26 per cent; in 1860 to 33 per cent; in 1870 to 50 per cent. At the present time the Atlantic steamers show an average of 55 per cent paying weight. The advance since 1870 has been comparatively slow, chiefly because much higher speeds are now required.

AFTER the great fire of 1872, the cost of bricks laid in the wall was ordinarily reckoned in Boston at $36 a thousand. Now, better bricks, quite as well laid, with better lime and cement, cost there, in the wall, $15 a thousand. Fireproofing processes have been of late greatly improved and cheapened, so that an ordinary merchantile building can be erected, with floors, roof and partitions all of iron and concrete, or terra cotta, for 10 to 15 per cent more than it would cost with the cheapest wooden floors.

TELEGRAPH and telephone poles are the latest development in the line of manufactures from paper. They are made of pulp in which a small amount of borax, tallow and other ingredients are mixed. These are cast in a mould in the form of a hollow rod of the desired length. The poles are claimed to be lighter and stronger than wood, and it is said that the weather does not affect them.

The International Gold Convention.

Last week accounts of the assembling and first day's proceedings of the International Gold Convention at Denver, Colo., only had been received when this paper went to press. On reassembling on Thursday morning, resolutions were introduced as follows:

By A. A. Reynolds of New Mexico asking Congress to revise the mining laws so that the present complications in acquiring titles to mining claims may be abolished.

By B. F. Gilture of California:

WHEREAS, The development of mines in California, Arizona, New Mexico and Colorado is greatly hindered by reason of the claims of Spanish land grants as owners to all mineral that exists within the boundaries of such grants; therefore

Resolved, That Congress be informed through the secretary of this convention of the great drawbacks under which the people of these States and Territories are laboring; that Congress be requested to take as prompt action as possible toward affording immediate relief to the people of said States and Territories by such legislation as will throw open to prospectors, miners and mining operations all mineral land within such Spanish land grants.

These resolutions were referred to the Committee on Resolutions without debate.

The following papers were read: Prof. E. B. Kerby of Colorado, "The Treatment of Low Grade Ores by Concentration;" John Dern of Utah, "Utah's Great Mining Camp, Mercur." E. Bignell of Nebraska read a paper on "Concentration of Ores, Dry," and Prof. Arthur Lake of Colorado one on "The Geological Formation of Colorado."

Prof. George Knapp of Illinois presented the convention a gavel made of historic materials.

L. B. Prince, president, acknowledged the gift in a brief speech.

At the afternoon session a telegram was read stating that Senator Stewart of Nevada had secured a reduction of the duty on cyanide of potassium to 12½ cents in the Senate bill and asking that a resolution be passed urging the conference committee to accept this rate.

The selection of a place for holding the convention of 1898 being in order, T. J. Summers of Omaha presented the name of that city, Hon. O. W. Powers presented Salt Lake and Hon. J. O. Buckley, Milwaukee. After a long discussion the matter was laid over until next day.

The Committee on Resolutions sub mitted a report asking the convention to instruct its president to protest against the incorporation in the new tariff bill of a claim imposing a tax upon the sale of stocks and bonds. The request was unanimously adopted.

The Chair was instructed to appoint a committee of five to draft amendments to the Government mining laws, which Congress will be asked to adopt at its next session.

The convention then adjourned until morning.

On reassembling on Friday, the names of Milwaukee and Omaha were withdrawn from the contest for place of holding the convention of 1898, and Salt Lake was declared the unanimous choice of the convention.

The following resolutions were introduced and referred: By O. W. Crawford of Illinois, that for the purpose of stimulating the mining industry Congress be memorialized to establish in each United States land district in the mineral-producing States a Government experimenting and testing station, on plans similar to Government agricultural stations, where ore may be tested free of expense to the prospectors; by Judge Brown of West Virginia, to change the name of the convention from the International Gold Mining Convention to International Mining Convention.

The chairman appointed the following committee to take the necessary steps toward securing the passage of a constitutional amendment establishing a Cabinet department, to be knows as the Bureau of Mines and Mining: L. Pence, Colorado; M. H. Herring, Texas; J. R. Hodges, Pennsylvania; Wm. F. Bechel, Nebraska; E. V. Smalley, Minnesota.

The Committee on Resolutions submitted its report, which was considered section by section.

The resolution memorializing Congress to throw open all mineral lands on Spanish land grants in California, Arizona, New Mexico and Colorado to location as mining claims was adopted.

The resolution asking Congress to throw open the asphalt and gilsonite lands on the Uncomphagre Indian reservation in Utah to mineral locations was adversely reported upon.

A motion to lay the report on the table and to adopt the resolution was carried by a vote of 93 to 22. Then Angus M. Cannon of Utah spoke against the resolution and moved that the whole matter be laid on the table. His motion prevailed.

Two resolutions providing for the appointment of a committee to take such steps as may be necessary to secure a recodification of the mining laws were adversely reported on. The convention disagreed with the report and referred the resolutions to the committee already appointed for this purpose.

The resolution relating to the proposed new Cabinet Bureau of Mines and Mining was adopted and referred to the special committee already appointed.

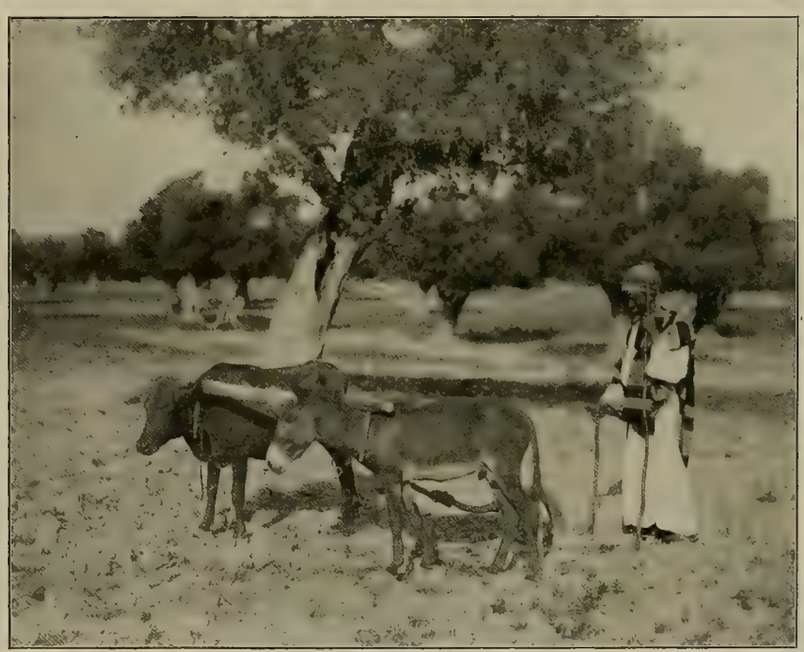
Resolutions of thanks to the Governments of Venezuela, Belgium, Italy, Sweden and Norway, Denmark and Mexico, for the interest they have taken in this convention and by sending representatives, and to Prof. George Knapp of Illinois for valuable relics presented to the convention, were adopted.

N. E. Guyot, a member of the Resolutions Committee from New Mexico, offered a minority report, declaring for the free and unlimited coinage of silver at the ratio of 16 to 1. The point was made against it that the order of business eliminated all political questions from discussion. The chair sustained the objections and the minority report was refused consideration.

Several papers were read at the afternoon session, including one by Chas. J. Moore, M.E., of Cripple Creek, on "The Cripple Creek Formation." The convention then adjourned *sine die* to meet next year at Salt Lake.

On Saturday the delegates left for Cripple Creek, where they were the guests of the camp until Sunday. A large number then left for Salt Lake to attend the Trans-Mississippi Congress there on the 14th inst.

DROMEDARY PLOWING FOR WHEAT NEAR CAIRO.



SYRIAN CULTIVATION OF OLIVE ORCHARD.

The Survival of the Ancient in Plows.

We recently gave several instances of the continued use of the most ancient types of plows, and different views in the same line are to be found on this page. One is a better view of Egyptian camel plowing for wheat near Cairo. The long tackling gives the dromedaries freedom of movement which they require, but it strikes the American driver as a rangy sort of an outfit, which it would be difficult to keep to a line. How that may be we do not know, as our training as a dromedary driver was confined to a half a day in a circus parade forty years ago; but it occurs to us that the Egyptian plowman does not care about a line, and probably he leaves as much as he turns, although the lands look fairly well. At what cost of effort it must, however, be possible to hold the point in the soil. The attitude of the man is in striking contrast to that of the modern plowman, and his work is probably in the same relation.

It will be interesting to observe how this old plow of the Pharaohs will endure the influences which are now to be brought to bear upon it. There has just been established near Cairo and almost under the shadow of the pyramids, an agricultural experiment station, and if the director does not among his first experiments test the efficiency of ancient and modern plows, we shall be very much surprised.

The other plowing scene shows the Syrian method of tackling up any sort of an animal that may be at hand, and shows the ox and the ass in a shape which would lead no American to break the tenth commandment. How the old Syrian in picnic costume and with such a team can do any responsible plowing it is hard to imagine. And yet thus it has been done for centuries, and thus it would ever be, probably, if the Caucasian race had not become so uncomfortably progressive and powerful.

THE reports of the mine inspectors in Great Britain show that the total number of persons employed below ground last year was 38,385, and above ground 6875, making a total of 45,260 persons, as compared with 44,872 persons in 1895. It will be seen that during the year only 388 more persons were employed, in and about mines, than in the preceding year, which, when considered with the largely increased output of mineral, indicates comparatively satisfactory results. The total of 11,952,417 tons mineral raised in 1896 compares favorably with 10,893,010 in 1895 and 11,254,225 in 1894, and is a record output. Compared with 1895, there is an increase of 1,059,407 tons of mineral raised during the year, made up as follows: 1,055,687 tons increase in coal, 4210 tons increase in fireclay, 688 tons decrease in ironstone, and 198 tons increase in other minerals.

AT the sixth annual meeting of the De Lamar Mining Company of Idaho, in London, it was reported that during the past year they had only been able to pay a dividend of 5 per cent, as compared with 17½ and 25 per cent in previous years, the main reason for this being the lower grade of ore on which they had had to work. They had also been steadily exhausting the silver stopes or rich shipping ore. There was £61,000 unexpended capital and reserve, and undivided amounts, as a substantial asset to fall back upon. Further development was now being carried out to ascertain whether the rich ore had become exhausted and should that prove true they had a large body of low-grade ore which, with improved appliances, could be worked.

THE bottom of the Pacific between Hawaii and California is said to be so level that a railway could be laid for 500 miles without altering the grade anywhere. This fact was discovered by the United States surveying vessel engaged in making soundings with the view of laying a cable.

Smith Striking Stamp Mill.

Springer Ore Concentrator,
Truax Ore Cars,
Rock Breakers, Hoists, Etc.

Why the Springer Concentrator is the Best:

It will do more and cleaner work than any rubber belt machine.
It weighs only one-half as much as some of the six-foot concentrators.
Is the most simple in its construction of any machine in the market, and only one-third as many pieces in it as in some of the others. Was invented by an old miner of forty years' experience handling every known concentrator on the market.
Should any piece need repairing, it can be removed without disturbing any other part of the machine.
Can be set up by any inexperienced miner.
Its distributor is perfection itself, distributing the pulp evenly over the entire surface of the belt.
Grade of shaking frame can be changed while the machine is running at full speed.
It is the strongest, lightestr unning and most inexpensive to keep in repair of any
Will save more of the fine slimes than any other machine.
Is cheaper than any other six-foot machine, costing only $350.00 f. o. b. cars or boat, San Francisco.
Will handle the pulp from five stamps better than any other Concentrator.
Has adjustable eccentrics, and any length of stroke can be had, thereby giving different speeds per minute.
The belt is very durable, being made of No. 3 Canvas, woven especially for the Springer concentrator.
This machine requires so little attention that one man will easily attend to a dozen of them.
It has a solid rubber flange, which no other canvas belt has.
Wear and tear upon this machine is not one-third as much as upon some of the other concentrators.

Coast Industrial Notes.

—A scarcity of shingles in the northwest has advanced the price to $1.15 per M.

—The California State Fair will be held at Sacramento from Sept. 6th to Sept. 18th.

—The British Columbia salmon canners and fishermen have compromised on ten cents per fish for the season.

—The Hawaiian annexation treaty has been reported favorably from the United States Senate committee.

—Nearly 25,000 people visited California since the 1st inst., induced by the ususually low rate of $25 from Chicago—2600 miles.

—Bids have been opened at Seattle, Wash., for supplying 500,000 tons of material for the construction of the Gray's harbor Government jetty.

—Compelling the Government to pay $425 per ton for armor plate is a good argument for the establishment of a plant on this coast for its manufacture.

—The total shipments of oranges from southern California for the season ending June 30th was 7340 carloads. This does not include the shipments on steamers.

—The work in detail for the Government at Marrowstone Point, Puget Sound, Wash., was given in this column last week. The contract was awarded to the Pacific Bridge Company last Tuesday for $163,450.

—By the close of July bids for the construction of the breakwater at San Pedro will have been advertised for by the Secretary of War, and it is expected that the actual work will be under way early in September.

—The Treasury Department at Washington has decided to use marble in the construction of the new San Francisco postoffice building. To this Congressman Loud objects, claiming that sandstone or granite would be more suitable and available.

—Ninety carloads of machinery have been sent from San Francisco to the asphalt mines on the Sisquoc, Santa Barbara county, Cal. Two pipe lines twenty-eight miles long, reaching from the mines to Gaviota, are to be constructed, together with structures for reduction works.

—At Tacoma, last Sunday, the 40-ton flywheel of the engine in the power house of the Tacoma Railway Company flew to pieces and wrecked the building. The shafting in the building was torn out and half a dozen dynamos badly damaged. The total loss will be $20,000 to $25,000, not including the loss of street railway revenues.

—The Trans-Mississippi Congress met at Salt Lake, Utah, this week. Hugh Craig of San Francisco was elected temporary chairman and addresses of welcome were delivered by the Governor of Utah, Mayor of Salt Lake, and Judge Goodwin. There were in attendance over 400 delegates, representing over twenty States and Territories.

—E. J. Baldwin is credited with having secured the one practical pass remaining in the Sierra Madres. Men are constructing a trail from the Santa Anita canyon to the territory adjacent to the San Gabriel canyon, thus making a pass-way to the Mojave desert; the grade, 1 foot in 16, is available for a railway line. The Southern Pacific Company has two —the Soledad and another over the Coast line. Cajon, far towards the east, is in the hands of the Santa Fe.

—The Santa Fe railroad proposes to experiment on a large scale with the storage of water in the arid regions of Arizona. President Ripley has let a contract for the construction of two big dams of masonry in the Arizona desert, to be at the mouths of canyons or gorges twelve or eighteen miles distant from the railroad. James Dun, chief engineer, estimates that each will hold 50,000,000 gallons of water—enough for the company's use along the Arizona division for eighteen months. The dams will be 40 feet high, constructed of sandstone quarried near by. The stone reservoirs will cost about $290,000.

—The Mexican Government has officially promulgated a concession for a railroad from Chihuahua, Mexico, to the Pacific coast. A. A. Spendlove and E. C. Creel are empowered to construct a railway to start from the city of Chihuahua, or from a point on the Mexican Central Railroad south of Chihuahua, and to extend in a westerly direction to a point on the Pacific coast in the State of Sonora. Construction will begin as soon as the Department of Communications has approved the plans, and within two years 200 kilometers must have been completed. Subsequent construction must proceed at the rate of 100 kilometers annually, and the entire road, with its telegraph line, must be completed within seven years from April 13, 1897. The subsidized length of the line is 600 kilometers (372.8 miles). A. A. Spendlove is the general manager of the Chihuahua Mining Company, Chihuahua, Mexico. E. C. Creel is a local banker and the manager of the Banco Minero, Chihuahua. The Mexican Government has also granted to Col. A. K. Owen a concession for a railroad from Presidio del Norte, on the Rio Grande, State of Chihuahua, west, via the city of Chihuahua, to a point on the Pacific coast in the State of Sinaloa. This last concession is without subsidy or Government aid. The mineral wealth of the State of Chihuahua, through which these railroads must pass, is considerable. Notwithstanding the impediments in the way or transportation and fuel, there are many mines in the Sierras that are to-day being worked with profit, and with the shortening of distance and the cheapening of transportation there are many small enterprises that will become large and profitable mines.

Personal.

CAPTAIN J. R. DE LAMAR has returned from Europe to Salt Lake.

W. L. MERRY of San Francisco has been appointed minister to Nicaragua.

M. M. FLYNN has been appointed superintendent of the Sacramento mine at Mercur, Utah.

HOMER DAVENPORT, the well-known caricature artist, is interested in oil wells in southern California.

W. J. BRYAN has made a tour of the coast this month, and says he will travel through Mexico in October.

HUGH CRAIG of San Francisco was elected temporary chairman of the Trans-Mississippi Congress at Salt Lake last Wednesday.

F. H. BOSTWICK, representing the Hendrie & Bolthoff Manufacturing Co. of Denver, Colo., is looking around California this month.

JONES BAKER, who was engineer for the London & Continental Mining Co. in South Africa, is in the Trail Creek, B. C., country for the same company.

FRANK L. BROWN of the Washburn-Moen Co., 8–10 Pine street, San Francisco, is the newly elected secretary of the Pacific Coast Hardware and Steel Association. The next annual meeting of the association will be held in San Francisco, June 17, '98.

Recently Declared Mining Dividends.

Swansea, Utah, $5000; payable July 3.

Silver King, Utah, $37,500; payable July 11.

Calumet & Hecla, Michigan, $1,000,000; payable July 7.

Anchoria-Leland, Cripple Creek, Colo., $6000; payable July 12.

Mercur, Utah, $25,000; payable July 21. Total to date, $750,000.

Montana Ore Purchasing Co., Montana, $40,000; payable July 15.

Portland Gold Mining Co., Cripple Creek, Colo., $30,000; payable July 15.

Champion Mining Co., Nevada City, Cal., 25 cents per share; payable July 20.

Golden Cycle, Cripple Creek, $7500; payable July 1. It is the intention of the company to keep up this monthly dividend for an indefinite period.

Standard G. M. Co., Grass Valley, Cal.; J. Mulroy, R. Riley, T. Cavanaugh, C. Mallon, D. McFall; capital stock $10,000,000, subscribed $5000.

Commercial Paragraphs.

MANAGER GRAHAM of the Vulcan Iron Works, 505 Mission street, San Francisco, is putting in an ice plant for the manufacture of ice at the Mountain Copper Company's works, Keswick, Cal. The Vulcan Iron Works makes a success of this work, and this year has put in seventeen plants of that kind on this coast, besides fitting up twenty-seven steamships with ice making machinery. The Keswick construction is in charge of Jno. W. Dyer, supervising engineer.

Obituary.

N. C. CREEDE, the discoverer of the great silver-mining camp at Creede, Col., died in Los Angeles, Cal., on the 12th inst. Creede camped with Conner's scouts through Colorado, Utah and Nevada from '62 to '70, prospected from '71 to '90, and about seven years ago "struck it rich" in several localities in Colorado, the most famous being Creede, which for three years was the largest silver producer in the country. In '93 Creede's wealth was estimated in millions; he sold his Colorado interests in '94, and bought a palatial home in southern California, where he ended his days.

WANTED.

Able, rugged man, as Roaster, thoroughly familiar with oxidizing dead roast of gold concentrates in Bruckner furnace. None other need apply. Address quickly, stating experience and qualifications.

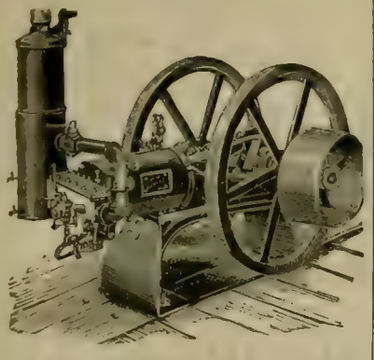
Cheap Power!



SAVE MONEY BY USING

—THE—

"DANIEL BEST" Crude Oil Engine.

This Engine can be operated on either Crude Oil, Distillate, Gasoline, or Kerosene. **It is the cheapest power on earth** and is not tied to any one kind of Oil, but can use any kind that will make gas and is not handicapped by being compelled to use a certain Oil. Do not forget this when in need of an Engine.

We guarantee our Engines to work perfectly on California Crude Oil, or Distillate, or any other kind of gaseous Oil; we however prefer CALIFORNIA CRUDE OIL, from Coalinga, Fresno county, for the reason that gas from Crude Oil will produce more power from the number of feet of gas used than from any other Oil, and it is also a natural lubricant as well, the valves being always lubricated sufficiently to prevent them from sticking, thus assuring greater durability of the working parts than it otherwise would be in using dry gas. And another advantage we claim is, that danger from explosions is reduced to a minimum, there being no accumulation of gas, but is used by the Engine as fast as it is generated and hence is absolutely safe. The following is a test that we made with one of our Five-Horse Power Crude Oil Engines, running ten hours on the different gas oils:

California Crude Oil, 40 grav.,	7½ galls.	at 5c.,		$.37½
Distillate	40	"	7½ "	8c., .60
Domestic Coal Oil	40	"	7¾ "	12½c. .93¾
Gasoline	74	"	8¾ "	15c., 1.31¼
City Gas	1000 feet.			2.00

We manufacture all sizes from two-horse power up, and will guarantee that our Engines will run cheaper and are more simple in construction, have fewer parts and hence are more durable than any other Gas Engines on the market. Seeing is believing; don't take our word for it, but come and investigate for yourselves. You can always see one in operation at our works. We will be pleased to see you and will at all times take pleasure in showing them up. Our Engines are specially adapted for running well and mining machinery—in fact, for any kind of power desired. We are the pioneers and first inventors of Crude Oil and Distillate Engines. **We always lead and never follow.** Send for Catalogue and Price List of the only genuine Crude Oil and Distillate Engine made.

DIVIDEND NOTICE.

The German Savings and Loan SOCIETY,

526 California Street.

For the half year ending June 30, 1897, a dividend has been declared at the rate of four and twenty-hundredths (4.20) per cent per annum on Term Deposits and three and fifty-hundredths (3.50) per cent per annum on Ordinary Deposits, free of taxes, payable on and after THURSDAY, July 1st, 1897. GEO. TOURNY, Secretary.

In the Superior Court of the City and County of San Francisco, State of California, Department No. 8. John V. Kimball, plaintiff, vs. Mabel L. Kimball, defendant. Action brought in the Superior Court, City and County of San Francisco, State of California, and the complaint filed in said City and County of San Francisco, in the office of the clerk of said Superior Court. The people of the State of California send greeting to Mabel L. Kimball, defendant. You are hereby required to appear in an action brought against you by the above-named plaintiff in the Superior Court, City and County of San Francisco, State of California, and to answer the complaint filed therein within ten days (exclusive of the day of service) after the service on you of this summons, if served within this county; or, if served elsewhere, within thirty days. The said action is brought to dissolve the bands of matrimony now existing between yourself and plaintiff, on the ground of habitual intemperance on your part for more than one year past. All of which will more fully appear in the complaint on file herein to which you are hereby referred. And you are hereby notified that if you fail to appear and answer the said complaint, as above required, the said plaintiff will apply to the said Court for the relief prayed for in the complaint. Given under my hand and seal of said Superior Court at the City and County of San Francisco, State of California, this 9th day of April, in the year of our Lord, one thousand eight hundred and ninety-seven. C. F. Curry, Clerk. By Joseph Riordan, Deputy Clerk. R. Thompson, Attorney for Plaintiff.

RUPTURE, Hydrocele, Varicocele, Piles, Fissure, Fistula, Ulceration, etc., cured without operation or detention from business. **NO PAY UNTIL CURED.** Consultation Free. Call or send for pamphlet.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

PUNCTURE DETECTOR FOR PNEUMATIC TIRES.—Samuel C. Freels, of Hollister, Cal., and John T. McKean, of Santa Cruz, Cal. No. 585,200. Dated June 29, 1897. The object of this invention is to provide a simple device for detecting air-holes or punctures in air-containing receptacles, and it is especially designed to be used in conjunction with the pneumatic tires of bicycles. It consists essentially of a casing adapted to be detachably fitted to the surface of the tire having an intermediate bottom pervious to air and a loose material upon said bottom which will be agitated by the air passing into the casing and through the pervious material so that it is only necessary to move the device slowly over the inflated tire or other article, and when it arrives over a point where there may be an opening for the escape of air, the material therein will be agitated by the air passing into the casing. A sight cover may be used to prevent the loss of the light material.

COMPARTMENT COOKING APPARATUS.—Louis Moser, San Francisco, Cal., assignor of one-half interest to Max Sniderman, same place. No. 585,922. Dated July 6, 1897. This invention relates to an apparatus which is designed to be used for cooking a variety of substances in different compartments with a single heating mechanism. It consists essentially of a chamber superposed over a suitable burner, the chamber being divided into separate compartments, each of which is provided with a draw-off or discharge. An expansion chamber is formed below, having its top wall forming a bottom for the superposed chamber, and a tubular extension from this expansion chamber serves to carry the heat up through the chambers above, where it acts upon another set of chambers arranged in line above the tube. There are suitable passages for the escape of the heat, and the bottom of the upper chamber is made of screen material, so as to disseminate the heat before its escape.

GOLD WASHING PAN.—Frederick Sletcher, San Francisco, assignor of one-half interest to A. & H. Dannenbrink, Gilta, Cal. No. 585,989. Dated July 6, 1897. This invention relates to improvements in pans such as are ordinarily employed by miners for hand washing of gold-bearing earth. The object of this invention is to easily separate the heavier valuable portion from the debris which it is desired to discharge, and, by means of certain curved indentations in the bottom of the pan, to form riffles in which the gold will be retained by reason of its greater weight. The pan is made in the usual form, with sloping sides, and has an inwardly projecting rib between the top and bottom. The bottom has crescent-shaped indentations, lessening in depth near the ends, and a screen or sieve frame fits the interior of the pan, its upper edge being curved or hooked to fit over the corresponding edge of the pan, while a sieve bottom is fixed to it, leaving a space between itself and the bottom of the pan. This sieve checks all the larger rocks, which can be thrown out at once, and the remainder of the material passes down, and, by the peculiar agitation of the pan, is separated, the lighter material being washed down by the water and passing over the edge, while the heavier material will be concentrated into the riffles at the bottom.

CONCRETE ARCHES AND FIREPROOF CONSTRUCTION.—G. F. & H. M. Gray, San Francisco, Cal. No. 585,911. Dated July 6, 1897. This invention relates to that class of fireproof and arched construction in buildings in which the arch or flooring is made of concrete laid upon temporary false work and permanently supported by metallic beams. The object of the invention is to provide a structure which, by reason of the intimate and practically integral construction of the arch and the furring strips, will avoid the usual practice of first making the concrete arch up to the level of the supporting beams and then subsequently placing a separate layer or flat sheet of concrete upon this arch in which to hold the furring strips. The invention comprises supporting beams, a layer of fireproof material thereon, an intervening arch of concrete supported by the beams, furring strips supported above the beams on this fireproof material incorporated directly in and flush with the upper surface of the concrete arch and a metallic strengthener incorporated in the lower portion of the arch, with interstices through which the concrete passes to incorporate fully with it.

BROOM ATTACHMENT.—Frederick Wittram, San Francisco, Cal. No. 585,897. Dated July 6, 1897. This invention relates to a scraping attachment for brooms. The object is to provide a stiff brace and connection between the broom or brush and the scraper to prevent its being bent and twisted out of shape. The scraper is made of sheet metal bent at an obtuse angle, having one portion attached to the head of the brush or broom, having its ends bent substantially at right angles to its body, so that the bent portions stand on edge and extend down upon the ouside of the ends of the head, being secured thereto. These ends are slitted or bent and folded on the line of the slit or bend, so that they stand on edge substantially at right angles with the body of the scraper, the latter being bent longitudinally to an obtuse angle, so that when attached to the brush it forms a very rigid connection.

FOR SALE.

The Following Machinery, Nearly New. Now Located in State Agricultural Exposition Building at Sacramento:

One 16x42 R. H. Poppet-Valve O'Neil Automatic Cut-Off, 100-Horse Power Horizontal Engine, built by the Union Iron Works, with Band Pulley, 22 in.x124 in. Pipe Connections and Valves complete, as it now stands.
One 22 in. Double Leather Driving Belt.
One 18 in. Union Exhaust Steam Feed Water Heater.
One Buffalo Duplex Boiler Feed Pump 6x4x6.
Two Tubular Steam Boilers, 54 in. diameter, 16 ft. long, in good order, with Furnaces, Grate Bars and Settings complete; one Injector for each Boiler, and all the necessary Checks, Valves and Gauges.
One Stack, 48 in. diameter by 80 ft. long.

For price and particulars, address

Has prospects for sale in Trail Creek and the whole of the Columbia basin. Will buy legitimate stock and mines for investors. Will examine mines. Has lots for sale in Trail and Deer Park.

Los Angeles Mining Bureau.

We have correspondents in Chicago, New York and London, and are prepared to place good gold and copper mines. Mines in California, Nevada, Arizona, and New and Old Mexico a specialty. Write us for circulars, etc. DR. STEPHEN BOWERS, Pres.; H. C. SIGLER, Sec. Corner Temple and New High Streets.

GOLD IN COLORADO!

Colorado has within its limits some of the greatest gold mines that has ever been discovered. In Cripple Creek in 1892 there were a few prospectors looking over the hills; in 1895 the camp turned out over $6,000,000 in gold. Leadville, the old bonanza camp and the mineral product of which made Denver what it is to-day, is becoming a big producer of gold. New inventions for working low-grade gold ores, together with the discoveries made to work rebellious ores, have opened up a field for the miners such as they have never enjoyed before, and Colorado has inducements to offer such as no other district in the world possesses; the record of the State in gold production for the last three years speaks for itself. Among the other prominent camps in the State are Telluride, Ophir, Rico, Silverton, Mineral Point, Durango, La Plata, Ouray, Saw Pit, Ironton, the Gunnison district and many others. New finds are being made and new camps are springing into existence every day. The Denver & Rio Grande Railroad, which is the pioneer road of Colorado and which has always been the miner's friend, reaches all the mining camps in Colorado. For elegantly illustrated descriptive books, free, of mines in Colorado send to

THE BEST BOOKS

Are always the **CHEAPEST.** All the latest and best works on **Mining, Metallurgical, Electrical and kindred subjects** can always be obtained through the office of the MINING AND SCIENTIFIC PRESS Below will be found a list of standard books in their various lines. If you do not find what you want in it, send for catalogue and price list of **Standard Mining Works and Scientific Publications.**

MINING AND SCIENTIFIC PRESS,
330 Market Street.....San Francisco, Cal.

Assaying.—Part I—Gold and Silver Ores.
Third edition; Just Out. Rewritten and Improved by the Author, C. H. Aaron. Embraces 130 12-mo pages, with illustrations; well bound in cloth; 1896. Price, postpaid.....$1 00

Assaying.—Parts II & III—Gold and Silver Bullion, Lead, Copper, Tin, Etc.
Latest edition. Contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter. Price, postpaid.....$1 75

Notes on Assaying and Assay Schemes.
By P. De Peyster Ricketts, E. M., Ph. D., Professor in Assaying in the School of Mines, Columbia College, N. Y. Prepared with special reference to the wants of the student and practical assayer. Containing also Rules for the Examination of Mines, Assayer's Outfit. Treatment of Ores, etc. Fifteenth edition. 8vo., cloth.....$3 00

Prospector's Field Book and Guide.
By H. S. Osborn.....$1 50

A Practical Guide for Prospectors and Miners.
By C. W. Moore. With numerous illustrations.....$4 75

Roasting of Gold and Silver Ores and the Extraction of their Respective Metals Without Quicksilver.
Second edition. By Guido Kustel, M. E. Contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. Price, postpaid.....$3 00

The Lixiviation of Silver Ores with Hyposulphite Solutions.
With special reference to the Russell Process. Second edition. Completely revised. By Carl A. Stetefeldt. Price, bound in cloth.....$5 00

Modern Copper Smelting.
By Edward Dyer Peters, Jr. Seventh edition. Rewritten and enlarged. Profusely illustrated....$5 00

Electricity in Mining.
By Sylvanus P. Thompson.....80 cts.

Practical Treatise on Hydraulic Mining.
By Aug. J. Bowie, Jr. On the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on heavy grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc Price, postpaid.....$5 00

Practical Hydraulics.
A book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers and Irrigators. By P. M. Randall. Contains useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulæ, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules and tables are prepared. Is specially applicable to the Pacific Coast. Price, postpaid, $2

The Metallurgy of Silver.
By M. Eissler. Profusely illustrated.....$4 00

Manual of Mining.
For the use of Mining Engineers and Technical Schools. Treating of Preparatory and Exploratory Work, Methods of Mining, Hoisting Machinery, Pumping, Ventilation Shafts, Tunnels, Blasting, Timbering, etc., etc. By Prof. Magnus C. Ihlseng, E. M., Ph. D. Second edition, with Appendix. 500 pages, 8vo., cloth.....$4 00

The Explorer's and Assayers' Companion.
A third edition of selected portions of the "Explorer's, Miner's and Metallurgist's Companion." By J. S. Phillips, M. E. A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying and Metallurgy. Price, postpaid.....$6 00

Aaron's Leaching Gold and Silver Ores.
By C. H. Aaron. The most complete handbook on the subject extant; 164 pages, octavo. Illustrated by twelve lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, postpaid.....$5 00

Manual of Assaying—Gold, Silver, Copper and Lead Ores.
By Walter Lee Brown, B. Sc. One colored plate; 132 illustrations on wood. Fifth edition. 12 mo. 533 pp. Price, postpaid.....$2 50

The Metallurgy of Gold.
By M. Eissler. Profusely illustrated.....$5 00

A Text Book of Mineralogy.
Based upon the System of Mineralogy of Prof. J. D. Dana. Embracing an extended Treatise on Crystallography and Physical Mineralogy. By Edw. S. Dana, Curator of Mineralogy, Yale College. With upward of 800 woodcuts and one colored plate. Seventeenth edition. 8vo., cloth.....$3 50

Notes on the Treatment of Gold Ores.
By Florence O'Driscoll, Associate Member of Institute of Civil Engineers. 8vo., cloth.....$2 00

A Practical Manual of Minerals, Mines and Mining.
By H. S. Osborn.....$4 50

Cyanide Processes for Gold and Silver Ores.
By E. B. Wilson, E. M. 12mo., cloth.....$1 50

Practical Metallurgy and Assaying.
By A. H. Hiorns.....$1 50

The Practical Metal Worker's Assistant.
By Oliver Byrne. Illustrated.....$5 00

Quartz Operator's Handbook.
By P. M. Randall.....$2 00

Assayer's Guide.
By Oscar M. Lieber.....$1 50

Assayer's Manual.
By Bruno Kerl. Illustrated.....$3 00

Metallurgy of Silver, Gold and Mercury in the United States.
Showing the latest practice pursued in American Metallurgical Establishments. With 186 engravings and folding plates, tables, etc. By Prof. Thos. Egleston, School of Mines, Columbia College. With corrections. Vol. I.—SILVER. 8vo.....$7 00

Metallurgy of Silver, Gold and Mercury—Continued.
Vol. II.—GOLD, MERCURY, Etc. Illustrated with 140 engravings and folding plates; 935 pages, 8vo., cloth.....$7 50

Manual of Determinative Mineralogy.
With an Introduction on Blow-Pipe Analysis (constituting the Determinative Part of Dana's Mineralogy). By Prof. Geo. J. Brush. Thirteenth edition, translated into the new system. 8vo., cloth...$3 50

Skeleton Mining Report.
Of great practical value to miners and mine owners in making a comprehensive report on mining properties. Useful and convenient to mining engineers as a field notebook. Price, postpaid....50 cts

MINE BELL SIGNALS.

Adopted, Used and in Force in Accordance with State Law.

FOR THE CONVENIENCE OF OUR READERS IN THE MINING COUNTIES WE PRINT IN legal size, 12x36 inches, the Mine Bell Signals and Rules provided for in the Voorhies Act, passed by the State Legislature and approved March 8, 1893. The law is entitled "An Act to Establish a Uniform System of Mine Bell Signals to Be Used in All Mines Operated in the State of California, for the Protection of Miners." We furnish these Signals and rules, printed on cloth so as to withstand dampness, for 50 cents a copy. MINING AND SCIENTIFIC PRESS. 330 Market St., San Francisco.

The right of the advertiser to know the measure of his purchase in circulation is no less than the right of the publisher to know the weight of print paper received from the mill.

THE LARGEST STOCK OF MINING, MILLING AND SMELTING MACHINERY WEST OF CHICAGO.

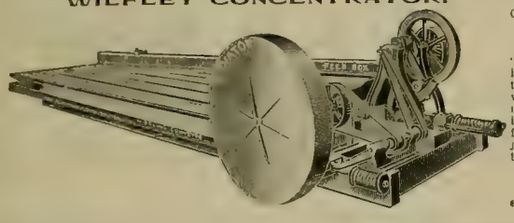
PIPE, PACKING, RUBBER BELTING, AND SUPPLIES OF ALL KINDS.

SOLE AGENTS FOR WILFLEY CONCENTRATING TABLE,

And claim for it BETTER work than any Concentrator made, with a capacity of from 15 to 25 tons per day of 24 hours. It is simplicity itself. No moving belts or intricate parts. Any one can learn to operate in an hour.

For confirmation of all of the above we refer to Henry Lowe, Puzzle Mine, Breckenridge, Col.; Mary Murphy Mine, St. Elmo, Col.; W. E. Renshaw, Mayflower Mill, Idaho Springs, Col.; H. E. Woods, Denver, Col.

WILFLEY CONCENTRATOR.



Office of— Milwaukee Mining Co., Standard Mining Co., Cœur d'Alene Mining and Concentrating Co., Galena Mining Co., Hecla Mining Co., Phœnix Mining Co. Lead-Silver Mines located in the Cœur d'Alene Mining District, Northern Idaho.
FINCH & CAMPBELL, GENERAL MANAGERS.

WALLACE, IDAHO, June 18, 1897.

The Mine and Smelter Supply Co., Denver, Colo. GENTLEMEN: Replying to your favor of the 8th inst., regarding my experience with the "Wilfley Concentrating Table," will state that in February last I placed in the vanner room of the Standard mill one of your tables, which has been in constant use every day since. It has been operated by the usual attendant of the vanners and has been given no special attention, and has been supplied with the same "feed" as the Frue vanners and at the end of each day's run has shown lower tailings than the vanners and produced from three to four times the quantity of concentrates of the same value per ton as any of the Frues. We have three more of the Wilfleys in the same mill, which are all doing splendid work and handling fully twenty tons each per day of silicious ore carrying about 10 per cent lead and 12 ounces silver. They are all making a remarkably close saving of values and giving the most perfect satisfaction. A very fair opportunity is offered in this mill for comparing the work of different concentrators, as we are using Harz jigs, Collom jigs, round buddles, Frue vanners, and Wilfley tables, and handling nearly 500 tons of crude ore per day, and all of the machines are given the class of work for which they are best adapted. I can heartily recommend the Wilfley to any one needing a concentrator for fine ores.

Yours very truly, EMERSON GEE, Manager Standard Mining Co.

These Tables have displaced belt tables of almost every make, as is shown by letters in our possession.

PRICE, $450.00.

L. C. MARSHUTZ. T. G. CANTRELL.

MANUFACTURERS OF

STATIONARY AND COMPOUND

ENGINES,

FLOUR, SUGAR, SAW AND QUARTZ MILL

MACHINERY.

AMALGAMATING MACHINES.

CASTINGS AND FORGINGS

OF EVERY DESCRIPTION.

All work tested and guaranteed.

IMPROVED PORTABLE HOISTING ENGINES.

Improved Self-Contained Three or Five Stamp Mill,

Saves bill for heavy timbers, millwright and mechanics' labor, and a large amount of space. The term self-contained means a great deal for the mine owner, and can be readily recognized and appreciated in making an estimate for an ordinary plant when the comparative cost is considered.

FIRST: There is saved a large bill for heavy timbers, in many instances obtained at great expense and loss of time.

SECOND: The saving in millwright and mechanics labor in framing and erecting.

THIRD: The large amount of space saved.

FOURTH: The great saving of freight.

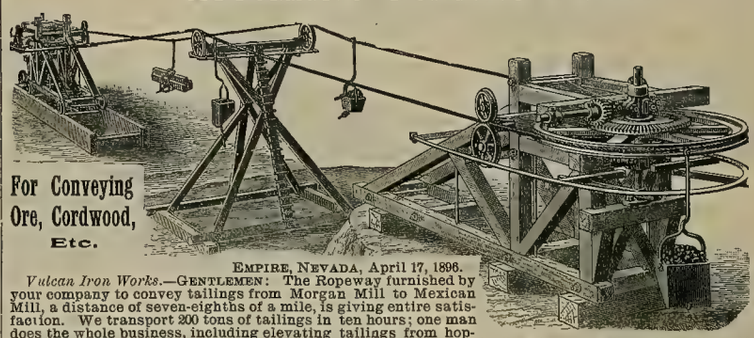
VULCAN ROPEWAY

—WITH—

AUTOMATIC ORE LOADER AND AUTOMATIC DUMPING DEVICE.



For Conveying Ore, Cordwood, Etc.

EMPIRE, NEVADA, April 17, 1896.

Vulcan Iron Works.—GENTLEMEN: The Ropeway furnished by your company to convey tailings from Morgan Mill to Mexican Mill, a distance of seven-eighths of a mile, is giving entire satisfaction. We transport 200 tons of tailings in ten hours; one man does the whole business, including elevating tailings from hopper in the ground, operating Vulcan self-loader, and attending to the Ropeway generally. The self dumper requires no attention whatever. The Vulcan loader I consider the best feature in the whole Ropeway, making it possible for one man to load 200 tons in ten hours.

Yours very truly, J. P. WOODBURY, Supt.

Market Reports.

The Markets.

SAN FRANCISCO, July 15, 1897.

It is doubted no longer that the tide of better times has set in, and while there will be quiet spells, yet there will be a steady growth of confidence and expanding business. The years of depression are giving way to years of greater prosperity. For the former we are largely indebted to the introduction of labor-saving machinery in every industry and avenue of life, which steadily threw out of employment wage-earners who, in turn, sought other avenues for obtaining means to meet the necessities of life. To the setting of the tide to better times we are indebted to the wage-earners successfully drifting into new avocations, which seem to be enlarging as the requirements of changed conditions make themselves felt. In a thorough canvas of this city among bankers, merchants and manufacturers there seems to be a unit of opinion that we have seen the worse for several years to come, and that 1898 will be a more prosperous year than for over a decade. In this State, and as for that on the entire Pacific coast, the outlook is of a most cheerful character. The gold mines never before turned out so much bullion as they are at present, while the number of miners at work was never before equalled. Aside from this, farmers are doing well. Good to high prices ruling for nearly every article grown or raised, with the crops above an average, together with lower transportation, will put the farmers, orchardists and others on a good substantial financial footing.

The banks report a plethora of funds, with the rate of interest ranging from 4 to 6 per cent on gilt-edge to good call paper. The banks report a very light inquiry, but look for an improving demand to set in soon. The call they expect will extend to nearly every industry and line of trade. The output of silver on this coast, according to the Selby Smelting and Lead Company, does not show any increase over that at the corresponding time in 1896, but gold shows quite a gain, with every section showing an increase. This out-turn helps very materially in increasing the available supply of funds for loaning. The East reports a more active market, which is freely met without advancing the rates of discount. The *Wall Street Journal* says: The low rates for money are unremunerative, and it is not very easy to loan money for 60 and 90 days in quantity. Last winter the low rates for time money greatly facilitated the accumulation of exchange, and good rates now would bring an immense flood of bills on the market. Unfortunately there seems little prospect of material advance in money for some little time at all events.

New York Silver Prices.

NEW YORK, July 15.—Following are the closing prices for the week:

	London.	N. Y.
Friday	27 11-16	60¼
Saturday	27 11-16	60¼
Monday	27⅝	60⅛
Tuesday	27 9-16	60⅛
Wednesday	27 9-16	60⅛
Thursday	27 9-16	60⅛

	Copper.	Lead.	Iron.	Tin.
Fri.	11 00 @11 25	3 65	10 00@12 00	13 90
Sat.	11 00 @11 25	3 60	10 00@12 00	13 95
Mon.	@	3 60	10 00@12 00	13 95
Tue.	11 10 @11 12½	3 55	10 00@12 00	13 95
Wed.	11 10 @11 12½	3 52½	10 00@12 00	13 95
Thur.	11 10 @11 12½	3 52½	10 00@12 00	13 95

The local bullion, money and exchange quotations current are as follows:

Commercial Loans, % per annum	—
Commercial Loans, prime	5
Call Loans, gilt edged	4@4½
Call Loans, mixed securities	—
Mortgages, prime, taxes paid by lender	6@8
New York Sight Draft	12½c Prem
New York Telegraphic Transfer	15c Prem
London Bankers' 60 days	4.87
London Merchants	4.85
London Sight Bankers	4.88
Refined Silver, per oz., 1000 fine	60⅛
Mexican Dollars	48@48⅝

SILVER.—The market shaded off slightly, but towards the close it was held fairly steady at the reduction. There is a fair export inquiry here for China and East Indies. At the East there is a fair movement to Europe. London continues to report a good movement, all things considered, to East Indies and Russia, but only fair to other countries. It is expected that China, East Indies and the Straits will take more next year. Bradstreet's says the expected issue of an Indian Government rupee loan and a decline of discount rates in India, the Bank of Bengal having reduced its rate to 6 per cent, are apparently responsible for a hardening in silver prices. The expectation is that, under the circumstances, India will be a moderate purchaser. The improvement, however, was slight, the quotation for bars in London rising from 27 9-16d to 27 11-16d, while the commercial price here advanced from 60c to 60⅛c per ounce.

MEXICAN DOLLARS.—There is a continued fairly free demand for China. The supply is large, both for spot and to arrive.

QUICKSILVER.—Our market is steady. New York reports strong selling competition, which causes some cutting. The receipts at this port last month aggregate 1352 flasks, against 2307 flasks for the same month last year.

Our market is quoted at $40 for domestic consumption.

COPPER.—The market has held to fairly steady figures the past week, both at home and abroad; the consumption is reported to be increasing.

The local market is quoted as follows:

Ingot casting, jobbing	18@—
Ingot " wholesale	12½@—
Sheet copper	—@16½
Bolt	¼ and 5-16, 20c; ⅜ and larger, 16½

TIN.—The market is holding fairly steady for both pig and plate.

Pig, per lb., jobbing	—@ 15
Plate, I C coke, heavy, per box	$4 10@4 25
" " " light, "	4 00@—

LEAD.—The market is weaker at the East, having recovered somewhat from its awakening over the decision we published last week.

Our market is quoted in jobbing lots as follows:

Pig	— @ 4 50
Bar	— @ 4 60
Sheet	5 75 @ 6 00
Pipe	5 00 @ 5 25

SHOT.—The market is firm.

Our market is quoted as follows:

Drop, sizes smaller than B, per bag of 25 lbs	$1 35
Drop, B and larger sizes, " "	1 60
Buck, Balls and Chilled, do, " "	1 60

POWDER.—The market is steady.

The market is quoted as follows for Hercules: No. 1, from 11¾c to 17¼c, according to strength and quantity; No. 2, from 9c to 11c, according to strength and quantity.

IRON.—There is a continued free consumption in our market, which keeps the market fairly steady, although some cutting is reported at times to place a fair sized consignment.

AMERICAN.	To Arrive.	Spot.
Sloss	$20 00	$22 00
Thomas	21 00	22 00
Salisbury	29 00	31 50
ENGLISH.		
Barrow	$21 00	$23 00
Gartsherrie	21 50	23 00

COAL.—Australian for shipment is offering at from $5 to $5.25. The market for spot and to arrive is practically unchanged.

We quote as follows:

SPOT FROM YARD—PER TON.

COKE.—The market is quoted as follows:

Gas Companies'	— —		— —
English, to load	9 50	@	— —
" spot, in bulk	10 00	@	— —
" in sacks	11 00	@	12 00
Cumberland	— —	@	— —

ANTIMONY.—The market is steady.

Our market is quoted at 7¼@8¼c in a jobbing way. New York mail advices quote 7½c for Cookson's, 6⅞@7⅛c for Hallett's and 6⅞@7c for Japanese.

NAILS.—The market is strong.

Wire, carloads, basis per keg	$2 35
" jobbing, " "	$2 35
Cut, carloads, " "	2 25
" jobbing, " "	2 25

BORAX.—The market is steady.

The market is quoted as follows:

Refined, in carload lots, in barrels	5
Refined, in carload lots in sacks	4¾
Powdered, in car lots	5
Concentrated, "	4¼

PLATINUM.—The market is quiet.

Our market is quoted in a jobbing way at $15 per ounce and for scrap $10 an ounce.

ZINC.—The market is barely steady.

Our market is quoted at 10 to 15 cents, according to thickness.

ALUMINUM.—The market is steady.

We quote in jobbing lots at 50 cents per pound for ingots.

Chemicals.

Importers and jobbers say that there is nothing new in any line, and that there will not be until following the passage of the tariff bill by both houses of Congress. Owing to the disagreement on several schedules, dealers do not seem disposed to operate except on a certainty.

SPELTER.—The market is quiet

We quote our market in a jobbing way at 5 cents a pound.

BISMUTH.—The market is steady.

Our market is quoted in a jobbing way at $1.50 a pound.

BONEASH.—There is a good movement at firm figures.

Our market is quoted in a jobbing way as follows: Extra, 4c a pound; No. 1, 3½c; No. 2, 2½c.

PHOSPHORUS.—The market is firmer.

We quote in a jobbing way at 70 to 75 cents per pound.

SODA ASH, 58% (LeBlanc process).—The market is firmer at $1.55 per 100 lbs. in a jobbing way.

CAUSTIC SODA, 60%.—The market is quiet at 3c per pound in a jobbing way.

HYPOSULPHATE OF SODA.—There is a fair demand at 2½c a pound from stores.

NITRATE OF SODA.—Market is steady.

Our market is quoted from store at 4c for 95%.

ACETIC ACID.—The market is steady at 6 to 12c per pound from store for carboys, according to make.

SULPHURIC ACID.—The demand is fair.

We quote in a jobbing way at 1½c per lb for 66°.

NITRIC ACID.—Our market is reported firmer from store at 6½@7c per pound in carboys.

BLUE VITRIOL.—Our market is steady.

We quote in a jobbing way at 4½c per pound.

Mining Share Market.

SAN FRANCISCO, July 16, 1897.

Trading on the two exchanges has been light outside cross-orders. The general public will not come in to any extent unless ore is shown up in sufficient quantities to assure dividends. There have been so many false reports about ore put out on the street and through the press that moneyed outsiders pay but little attention to what they hear or read about the mines. So long as some of the mills and mines are run as they have been for years past, just so long will there be a lack of confidence. If the powers that be are desirous of inspiring confidence and show to the world that the mines are worked and ore milled in the interest of all shareholders, it would seem as if they would have the two run separately and distinct, and not, as is generally supposed, in collusion by which outsiders get assessments and insiders get the bullion. The steady levying of assessments is not calculated to help matters, but it may be shares and not money that is wanted.

The work on the Comstock lode ought to attract attention within the next two or three months unless it is turned to one side or stopped. The work at one or two points on the Brunswick lode ought to attract more attention soon. In the Bodie district preparations have been under way for some time for more extensive work this year than for several years past.

The news from the Comstock mines is rather unimportant to outsiders, but to those informed on the mines it is quite interesting, for much of it is still in the right direction; yet, as has been done quite often in the past, it may be changed or stopped just in time not to strike ore. Interest by outsiders changes from week to week, being guided by the share market manipulator through street pointers or cappers and also by write-ups. Last week it was Sierra Nevada and Yellow Jacket, and now they are directing attention to Potosi on the Brunswick lode. This work was mentioned in this paper some time ago, and therefore is nothing new. From Utah we are without anything of special interest to report. Clay seams and lines of quartz are still cut by the north drift. In Sierra Nevada west crossdrift No. 3 on the 900-foot level has been advanced at last advices over 20 feet, without finding anything of importance. No ore strike is expected to be reported unless for the purpose of striking shorts down here. The work reported on the Layton tunnel is in the wrong direction for finding much ore. In Union work is confined still to the 900-foot level.

They continue to find 75-cent ore in Mexican on the 1000-foot level in the southwest drift. At last advices there was a seepage of water. In Ophir they were at last advices in $1 ore on the central tunnel level. This will help them to collect an assessment before long. On the 1000-foot level there is nothing new to report. No. 3 west crossdrift is not quite far enough in to be stopped. In Con. Virginia active exploiting work is being done on the 1000-foot, 1550-foot and 1650-foot levels, with varying success. There was raised the past week twenty-two tons of ore assaying slightly over $39 to the ton. There is no change in the Best & Belcher and Gould & Curry joint work. In Savage the usual routine work is reported. No work is reported in either Hale & Norcross or Chollar. In Potosi they are running a south drift, raising to the surface, repairing shaft and doing dead work. They hoisted seventy-four tons of low-grade ore. It assayed about $8 in gold and nine ounces in silver. The Nevada mill crushed a little over 110 tons of ore. In Alpha they have been doing some dead work on the 500-foot level. There is nothing new reported from the joint west crossdrift of Con. Imperial, Confidence and Challenge. It is given out that the west country will be thoroughly exploited jointly by Yellow Jacket, Kentuck and Crown Point on the sage brush level and by Yellow Jacket on the 1000-foot and 1100-foot levels. If the work is done in the interest of shareholders there can be no doubt of the result, but very few have confidence that it will. From Crown Point, Belcher, Seg. Belcher and Overman nothing new has come to hand. The three latter continue to raise some ore each week.

On the Brunswick lode the news is rather interesting for it indicates that the Potosi mine will be developed, for, it is stated, the ore improves running south in the Chollar ground. The joint work of Con. Virginia, Best & Belcher and Gould & Curry is practically the same as reported in our last week's review. In No. 2 shaft they have about finished cutting out a station to develop the 600-foot level. It is expected that good results will follow work on this level if run into Con. Virginia. In Chollar they are working towards Potosi on the 400-foot level. They have commenced exploiting on the 600-foot level. There was extracted last week 102 tons of ore of fair grade, assaying over $14 gold and about 15 ounces silver. From Occidental there is nothing new to report.

The following illustrates the changes of the week:

Mines.	July 8.	July 15.

Regarding Colorado's mining share market, Frank H. Pettingell writes from Colorado Springs, Colo.: "The market is again in a very unsatisfactory condition, and why? Because the hand of manipulation is too keenly felt. The experience of those who have bought recently purely for investment, based on reported improved condition of the properties, have invariably sustained losses. Of Mollie Gibson we have nothing to remark at present, but prefer to await further develop-

WILL NEGOTIATE with owners or their duly authorized agents only.

WILL INVESTIGATE only thoroughly bona-fide properties, either Mines, Prospects or Mineral Lands, whose owners are willing to make reasonable terms. When sending reports on properties also send terms on which you are willing to sell or lease.

THE DEMAND FOR STUMP PULLERS.

Another order for a California Stump Puller has just been received from Honolulu. This makes the second within a year from Hawaii. Three more to Mexico, one to Central America and one to Siberia, indicates the growing favor in which these machines are held.

Send to A. BARNES, Gen'l M'g'r. 82-84 Zoe St., S. F., Cal.

"It is character, not circulation, that some advertisers want." Very well. The MINING AND SCIENTIFIC PRESS has both.

ment before making any attempt to explain to those who bought at the highest figures, at a time when they or their brokers knew not why. That 'there is no fool like an old fool,' is effectively illustrated when we recognize the identity of those who are sullenly nursing fancy-priced Mollie Gibson. We prayerfully hope that each phenomenal strike recently circulated regarding this resourceful property will be more than substantiated by facts that cannot be questioned. It is with deep gratification that we observe whenever this stock advances, as of late, a similar effect overflows to the entire list. Activity can do the market no harm, whether of a downward character or not. It promotes interest; it inspires confidence as to the permanency of trading. If some stocks are too high, they cannot decline too soon to effect a permanent adjustment of values. Manipulation should be frowned down and actual mining encouraged, at the detriment of the imaginary. If Mollie Gibson goes up and remains, other stocks possessed of true merit will surely follow in its wake. The eyes of investment are carefully watching the situation, and, if proper discretion is used by influencing operators, good times cannot be avoided. No line of investment presents as many attractions as gold mining, and no State rivals Colorado, and no stocks compare with those listed on the Colorado Springs Mining Stock Association. Development, prospecting and production are progressing at Cripple Creek without interruption and with results almost beyond the hopes of the most sanguine. We recommend no particular stock, and only ask that actual conditions be inquired into. A 'boom' is not wanted by the conservative, and no intelligent operator predicts one. The ignorant penny stock speculator who buys for a 'flyer' is tottering on his last legs, and, having imbibed beyond his capacity in 'flyers' and little else, will find that his cloud of mining stocks has no silver lining. Mining is not benefited by this class of visionary and pretended investors; printer's ink, postage and time are too expensive to even attempt to successfully treat those painful cases, and they invariably become such after a series of transactions, for sooner or later they fall by the wayside of poor judgment, and then rend the atmosphere with howls of the swindling tactics of all connected with mining. If by any possible circumstance they encounter profit, no secrect is so perfectly guarded. Why not, instead of courting these rainbows, utilize our efforts to attract the careful, experienced and energetic representative of known capital who desires mines, purchases only on expert examinations, thereby benefitting the entire industry, the State and his principals. There are few evidences of anything discouraging but the few little drawbacks that accompany all business, and, because they relate to mining, it is no sign they should be magnified."

Under date of Salt Lake City, July 9th, James A. Pollock writes regarding the Utah mining stock market:

"This week showed no inclination towards a resumption of activity. There is a steady business going on, but the demand for stocks is not sufficient to put any snap into the market, which seems to be settling down to the annual dullness at this season. Stocks are a purchase now, and with any further tendency to sag they are bargains for the buyer. I earnestly advise clients to watch the silver stocks and to keep in touch with the silver situation. There will be more opportunities to make money in low-priced silver stocks within the next one or two years than have ever before been presented.

"Ajax was fairly active, but prices were somewhat shaded again. The company has about decided to sink several hundred feet deeper in order to open up the ore bodies which have produced so generously above, and which have gone down to the 1600-foot level in the Mammoth. Only very limited inquiry occurred for Anchor, while Alliance was entirely neglected. Bullion-Beck was in a little better demand and fair business occurred at advanced figures. The grade of ore being produced has improved somewhat and the outlook seems more favorable. It is not likely that dividends will be resumed this month. Buckeye has levied a one-cent assessment. Prices were again lower.

"Practically no offerings were made of Centennial-Eureka. There seems to be no sellers at would-be buyers figures. Some business was done in Chloride Point at last week's figures, but there is but little local demand. Dalton is reported to be looking very well, but business in the stock was not heavy. Orders have at last been given to fire up at the Marsac mill of the Daly company. A large supply of ore is at hand at the plant and the mines are in good condition. The stock should see better figures. Daly-West changed but little and business in the stock was at a standstill. Only light business was done in Dexter, although prices were a little firmer. Dalton & Lark was stronger.

"Eagle was hardly as active as during the previous week, but there was no shading of prices. Four Aces was featureless. The company is doing a great deal of development work. Geyser-Marion was very active, as usual, and while prices changed little they remained quite firm. On the present selling price the stock is paying 26 per cent annually. The properties are officially reported to be in splendid shape and both mills are at work. Galena is sending in some very high grade ore. The stock did some business at last week's figures. Horn silver is doing well. Little Pittsburg has changed but little for some time past, but is not doing heavy business just now.

"The Mercur's July dividend books may not close for a few days on account of President Dern's absence from the State, but the usual amount is assured. On very limited offerings the stock continues strong. At the properties the showing is excellent. Mammoth is just resuming mill operations. The stock gives promise of great strength. Northern Light was quite active at last week's bidding figures. Ontario's continued regular dividend payments has attracted much favorable attention to the stock and prices were firmer. Omaha did some business at unchanged figures.

"Sunbeam has held its annual meeting and should resume operations next week. The stock was stronger again. Swansea has paid its July dividend of five cents, and South Swansea has declared the regular amount to be paid on the 21st. Both stocks were somewhat stronger. Silver King's usual dividend of twenty-five cents is due to-morrow. Sacramento did some business at a slight advance. Sunshine was not active and last week's figures governed. Tetro is pushing development work with great energy. Utah was on the market with some splendid ore."

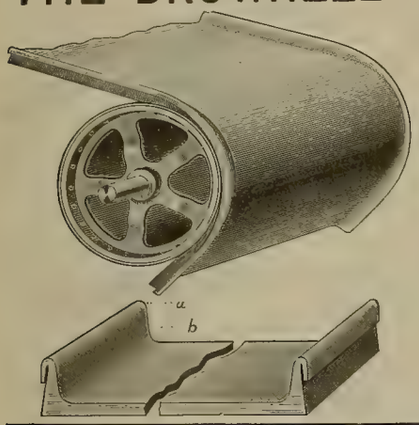
Is an important question. When asked for an "ad" demand proof of extensive circulation among probable purchasers.

THE BROWNELL "PATENT LIP" FLANGE FRUE VANNER BELTS.



It has taken years of ceaseless testing and experimenting to produce the superior belt which we now offer, with elastic flanges and pliable body reinforced with specially woven duck. Every belt is manufactured by experienced workmen, and carefully tested on machines especially built for that purpose; consequently we are to day manufacturing the best belts that mechanical ingenuity, combined with honesty of construction, can possibly produce.

ORIGINAL EMPIRE MILL & MINING COMPANY,
GRASS VALLEY, NEVADA CO., CAL., Feb. 20, 1897.

JAS. S. BROWNELL, ESQ., San Francisco, Cal.—DEAR SIR: The Brownell Patent Lip flange belt for ore concentrators, which I bought of you nearly two years ago, has been in constant use and is in good order and gives us perfect satisfaction. We have several other kinds of belts in the mill, and your belt and flange I consider the best of all. Yours respectfully, ROBT. WALKER, Superintendent.

ROANOKE MINING COMPANY,
MOKELUMNE HILL, March 4, 1897.

MR. JAS. S. BROWNELL, 132 Market St., San Francisco, Cal.—DEAR SIR: We have in our 20-stamp mill at this place five Frue vanners; three of these are equipped with the Patent Lip flange belt and two with the plain flange belt. We certainly consider the former a great improvement on the latter. They will certainly wear much longer, as cracking now seems out of the question. Any one purchasing the Frue vanning machine should see that it is equipped with the Patent Lip flange belt. Very truly yours, ROANOKE MINING COMPANY.
Per G. M. WILDE, Acting Superintendent.

Mining Machinery & Supplies.

Sole Licensee for the Manufacture and Sale of the

ROPP STRAIGHT LINE FURNACE

FOR ROASTING, CHLORINATING AND SULPHURIZING ORES.

Extracts from Letters Received from Mr. Phil. Argall, Manager the Metallic Extraction Co., Cyanide, Colorado:

January 2, 1897.

"The roasting is invariably good. We can [illegible] tons per day to 0.13% sulphur, when everything runs smooth. Our month record which, of course, includes all delays, is 1700 tons, from 1.94% sulphur to 0.16%."

February 19, 1897.

"Our furnace is now running very nicely indeed, averaging 90 tons per day to 0.10% sulphur, and doing excellent work; in fact, it has improved right along and we are highly pleased with it.
"For 24 hours ending 7 A. M. to-day 102 tons were roasted."

The ROPP FURNACE is now in successful operation at the following reduction works: The Hanauer Smelting Works, Salt Lake City, Utah (one furnace); The Metallic Extraction Co., Cyanide, Colo. (one furnace); The Colorado-Philadelphia Reduction Co., Colorado City, Colo. (three furnaces); The Selby Smelting & Lead Co., Selby, Cal; (one furnace); The Mount Morgan Gold Mining Co., Rockhampton, Queensland (one furnace); and Broken Hill Proprietary Co., Broken Hill, New South Wales (two furnaces).

Recent Improvements in Gas Engines.

Herewith is illustrated one of the latest products of the Union Gas Engine Co.—a 4 H. P. marine engine, fitted to run on kerosene. Similar engines fitted to run on gasoline and naphtha have been built under the patents of this company for the past ten years. No entirely successful kerosene engine for marine service has heretofore been built in America where the kerosene vapor is taken into the cylinder of the engine and there exploded.

The charge in the cylinder is ignited by an electric spark, which does away with all fire or flame outside the cylinder after the engine is started.

Before starting a torch is used for five minutes to heat the vaporizer, after which it is extinguished. The care required is the same as in the ordinary gasoline engine. This invention is deemed of value in making this type of engine available in countries and places where gasoline, naphtha, or benzine are not obtainable.

The lower cut shows the latest improved five-horse power "Union" stationary engine, fitted to run on either common stove gasoline, naphtha, benzine, or city gas. This engine is designed for running centrifugal pumps, dynamos, ventilating fans, and high-speed machinery. Its normal speed is about 420 revolutions per minute. When intended to drive a dynamo, for electric lighting, two fly-wheels are supplied, as per cut. The builders say it will develop five-horse power on the pulley, on a consumption of 20 cubic feet of gas per actual horse power per hour.

These engines are built in various sizes by the Union Gas Engine Co. of this city. This pioneer company has a reputation for good workmanship and progressiveness second to none.

THE expenditure on the mines of the Rand, South Africa, in 1896, amounted, according to the State Mining Engineer, to £10,681,000, while the gold produced figured up £8,603,821. Of the money spent, £7,131,000 was put down to the 79 producing mines and £3,547,000 to 106 non-producing mines. For an expenditure of £7,-134,000 the producing mines made a profit of about £1,500,000. Much of the money spent was in the way of developing new mines—permanent improvements which were not expected to make any return. Yet a very large proportion of the producing mines made no profit, and under present conditions cannot be made to pay. It has been shown that with reductions in the cost of working that can be brought about by getting rid of the dynamite monopoly, and reductions in the exorbitant railway charges, and in other directions many mines now not capable of yielding profits could be made to pay. In most of the mining districts of the world at the present time the amount of money being expended in development work and the erection of mills and machinery is out of proportion to the yield of gold. But for every dollar being put in many will be taken out in the future.

The Treadwell Mine.

Capt. Thomas Mein, San Francisco agent of the Exploration Company of London, has sent on a report on the Alaska-Treadwell mine, in which he says that while the pay ore has not become richer in depth the deposit is much larger than there was reason to believe from the developments made up to the time he left the mine. In the east end there is a block of ground embracing two sections, which were considered waste, but which have been proved by new development on the 220-foot level to be the best ore in the mine, and there are 400,000 tons of good milling ore in the block. Superintendent Duncan has estimated that there are 2,960,014 tons in sight, but he is said not to have allowed for the ore above the adit level and only for ore exposed to the end of the drifts being run. For these reasons Captain Mein says there are 5,000,000 tons above the 220-foot level, and it is safe to estimate it will last 100 feet below that level, which would make 7,000,000 tons. To obtain additional power it is proposed to build a dam on Lemon creek, and to erect another electric plant. Captain Mein recommends the putting up of another 240-stamp mill at a cost of $500,000, and says that with 480 stamps the cost of mining and milling the Alaska-Treadwell ore would not exceed $1 a ton.

The Alaska-Treadwell mine has long been noted for having the largest stamp mill in full operation in the world, and for working ores at a cheaper rate per ton than any other large mine. The great advantage in this respect is the fact that the rock is quarried, practically.

This and other mines are also giving promise of holding out in depth.

TABLE OF CONTENTS.

ILLUSTRATIONS.—"Union" Marine Engine, Using Kerosene; "Union" Stationary Gas Engine—Late Pattern, 69. The Klondyke, Alaska, Placer Region, 74. Trench in Ogden Canyon; The Pipe Line Along the Side of the Canyon; Making the Wooden Pipe; Exterior or Power House, Showing One Venturi Meter and Receiver, 76. Plan of Power House; Section of Power House; Interior of Power House, 77.

EDITORIAL.—Recent Improvements in Gas Engines; Expenditure on the Mines of the Rand; The Treadwell Mine, 69. Bullion Shipments from Mariposa County; The California Gold Yield; Advertising Out Co-owners Delinquent in Assessment Work; The Yukon Fever, 70.

ELECTRICAL PROGRESS.—The Power Plant of the Pioneer Electric Power Company of Ogden, Utah, 76-7-8. The U. S. Warship Brooklyn; A Trolley Up the Jungfrau; Examining Trunks with Roentgen Rays; The Kineotoscope, 78.

SCIENTIFIC PROGRESS.—Liquid Air in Electrical Works; Interdependency of Inventions; Telegraphing Through Hills; A New Use for Aluminum; Increase in the Business of the Patent Office; A Submarine Camera; The Lightest Balloon Ever Built; Resuscitation by Thawing, 78.

MECHANICAL PROGRESS.—To Restore Smoothbore Cannon; A Giant Umbrella; Down Drafts; New Things in Paper; Speed of Modern Warships; Number of Miles of New Track; A New Plan for a Cheap and Durable Roof; A New Horseless Carriage, 79

MINING SUMMARY.—From the Various Counties, of California Nevada and Other Pacific Coast States and Territories, 80-81.

THE MARKETS.—Eastern and Local Markets; Mining Share Market; Sales in San Francisco Stock Board; Notices of Assessments, etc., 90-91.

MISCELLANEOUS.—Concentrates, 71. John Dern on Mercur, Utah; Work of the United States Geological Survey; Production of Aluminum in the United States; The Longest Distance Ever Encompassed by the Human Vision, 72. A New Mexican District; The Horseflesh Business in Oregon; Use of Petroleum Refuse; Rules to Govern Forest Reserves, 73. The Alaskan Placers; Plans for the University of California, 74. The Transmississippi Congress; Mr. Preston's Explanation; A New Source of Asphaltum; Increasing Mineral Yield of British Columbia; Broke All Records; Precipitating Zinc in Aqueous Solution, 75. Coast Industrial Notes; Personal; Commercial Paragraphs; Recently Declared Mining Dividends; Recent California Mining Incorporations; Catalogues, Etc., 83. List of U. S. Patents for Pacific Coast Inventors; Notices of Recent Patents, 86. Machinery at the State Fair, 91.

The California Gold Yield.

Mr. Preston, the director of the Mint of the United States, has cut down the estimate of the statistician of the gold yield of California for 1896 from $17,181,562 to $15,235,000, and makes an explanation that will not be satisfactory to those familiar with some of the facts in the case. In his letter to Congressman De Vries, which will be found in another column, he says that Mr. Yale's estimate is based solely upon information furnished by superintendents and owners of mines, postmasters and express agents. Mr. Yale as an official of the Mint certainly had access to data as to receipts of bullion at the Mint and at the smelting and refining works. Besides that he had access to all information of the State Mining Bureau and brought to his work long experience. It might be pertinent enough to ask Mr. Preston why it was that he accepted Mr. Yale's figures for 1895 without making any changes. They were made up from data obtained from the same sources as those made use of in 1897. Certainly the officials of the United States Mint in Washington have had to do with the statistics relating to the product of the precious metals long enough to have found some permanent system for gathering data.

If they are to continue to take figures gathered in one way one year and those gathered in another way the next, the public will lose confidence in their work. This will not be an unmixed blessing if they do not do good work.

At a time when so much money is being invested in California mines any figures, such as those sent out by Mr. Preston alleging that there has been no increase in the yield, will make many would-be investors pause. They know that large sums were invested in California mines in development work and in the erection of mills, and that more stamps were dropping in 1896 than in 1895. If the yield is announced to be decreasing they will think that California is a declining mining district, when in fact no district in the world is in a more healthy condition. That the first figures—$17,181,562—were conservative is the belief of all who are at all familiar with the industry.

THE Mariposa correspondent of the MINING AND SCIENTIFIC PRESS writes this week that during the past three months the bullion shipments from the mines of that county have exceeded in amount those of the entire year 1896. In Tuolumne, Amador, Calaveras, Placer, El Dorado, Nevada, Siskiyou and Trinity, the leading producers, the number of stamps falling has been materially increased. In no part of the State has there been any indication of falling off in the yield by the closing down of mines. It is to be hoped that any statistics gathered this year on this subject will be better treated than were those of 1896.

The Yukon Fever.

The importance of the late discoveries in Alaska on the Yukon river—or rather in the British Northwest Territory—is apt to be exaggerated on account of the air of romance, the strange conditions and the amount of space given to them by the daily papers the world over. That very rich and very extensive gravel deposits have been discovered and will yield largely, there can be no question. In time quartz mines will be discovered, developed and worked; but that the country will radically affect the supply of gold in the world and its price, as some seem to suppose, is entirely out of the question. There is in the world to-day, in coin or in other shape, some eight billions of dollars in value. In case the Alaska gold fields should output in one year eighty millions of dollars, it would add only one per cent to the world's supply of gold. It is not at all probable that Alaska will turn out any such sum, or even a quarter as much, for years to come, unless very much more extensive gravel deposits are discovered.

The United States Geological Survey has issued a general statement as to the possibilities of the whole Yukon country. While they show that a very large district is yet to be prospected, they point out the fact that the source of the gold is a comparatively limited area and that near this, or within its limits, must be found all the rich quartz and placer deposits.

The discovery of pay gravel along the different creeks varies very much as to quality. On several of the creeks the rich deposits have already been worked, and those who worked them have gone to the newer discoveries. There were in the Territory, so it is estimated, two or three months ago, some 3000 miners. If each miner takes up, as is his privilege, 500 feet in length along a creek, they would be able to lay claim to no less than 300 miles of these placers. It is now said by the papers that some 20,000 people will go in this fall or in the spring. A little calculation will show that the Yukon placers must be much more extensive than is generally supposed to furnish even a moiety of these with claims.

In time, and it will probably be short, wages will be much lower, supplies cheaper, and much of the gravel that it will not pay to work under the present conditions will become valuable. This of course will make the Yukon country of more permanent and lasting value to the world at large than the present work that is being done.

Probably the greatest value of the excitement that has been caused by the reports that have come from the north is that it is apt to do much to dispel the business depression, loosen up money and improve trade. Curious as it may seem, reports from trade circles in San Francisco indicate that already, within a week after the first reports arrived at San Francisco, prices generally in the market have gone up and there is a better tone in every direction. In this direction, more than any other, did the discoveries of gold in California do the world good in increasing business, and being the cause, directly or indirectly, of new enterprises. In a material way the excitement caused by the discoveries of gold in California did nearly as much for the world's progress as did the output of gold.

It must be remembered that the news of the placer finds on the Yukon, if made where there was telegraph or postal communication, would have filtered out gradually and caused much less stir. The truth of this can be seen in the case of South Africa. There were discovered the greatest gold fields in the world, in some senses—for they are lasting, and are producing nearly as much as was produced in California in its palmiest days, and the output is now increasing fast. Cable communication gave full and definite information, that prevented people from going who had no business, yet, at the same time, drew in those who were wanted. There was no rush of inexperienced men.

Suppose no word came to the rest of the world from Mariposa county, California, from the first of this year until the first of next. Reports show that the yield for the past three months is larger than for all of 1896. What would be the result? Mariposa would attract the attention of mine investors the world over, and would send in more bullion per miner employed than does the Yukon.

The wisest men in the world are always apt to overestimate such discoveries as those made in the Yukon country. Michel Chevalier, the political economist of France, in 1857, in his work, translated by Richard Cobden, "On the Probable Fall in the Value of Gold and the Commercial and Social Consequences Which May Ensue and the Measures Which it Invites," wrote that, in consequence of the discoveries made in California and Australia: "In our day we seemed destined, like our fathers of three centuries ago, and from the same causes, to witness the spectacle—or, in other words, the shock and crisis—of a universal rise in prices; with this difference, however, that up to the present time the new discoveries affect only the production of one of the precious metals, gold, of which vast deposits of immense richness, hitherto unknown, have been successively discovered. * * * Under the influence of this greatly increased and cheapened production of gold it is reasonable to expect, at least in those countries where gold circulates in large quantities and where it is, or tends to be, the sole medium of exchange, a general disturbance of prices, deeply-felt derangement of interests, and a modification more or less radical in the different relations of society."

Chevalier suggested remedies and the political economists of the world put their heads together and devised means of meeting the changed condition of affairs. But all this was unnecessary; the human race needed no conditions, and the large output of gold was absorbed immediately in new industries and increased enterprises.

Advertising Out Co-owners Delinquent in Assessment Work.

A correspondent asks about the procedure in cases of advertising out co-owners of mining claims who refuse to do the required assessment work. On this subject section 2324 of the United States Revised Statutes says:

On each claim located after the tenth day of May, eighteen hundred and seventy-two, and until a patent has been issued therefor, not less than one hundred dollars' worth of labor shall be performed or improvements made during each year. On all claims located prior to the tenth day of May, eighteen hundred and seventy-two, ten dollars worth of labor shall be performed or improvements made by the tenth day of June, eighteen hundred and seventy-four, and each year thereafter, for each one hundred feet in length along the vein, until a patent has been issued therefor; but where such claims are held in common, such expenditure may be made upon any one claim; and upon a failure to comply with these conditions, the claim or mine upon which such failure occurred shall be opened to relocation in the same manner as if no location of the same had ever been made: *Provided*, That the original locators, their heirs, assigns, or legal representatives, have not resumed work upon the claim after failure and before such location. Upon the failure of any one of several co-owners to contribute his proportion of the expenditures required hereby, the co-owners who have performed the labor or made the improvements may, at the expiration of the year, give such delinquent co-owner personal notice in writing or notice by publication in the newspaper published nearest the claim, for at least once a week for ninety days, and if at the expiration of ninety days after such notice in writing or by publication such delinquent should fail or refuse to contribute his proportion of the expenditure required by this section, his interest in the claim shall become the property of his co-owners, who have made the expenditures.

The Federal law provides, as will be seen, for advertising out a delinquent co-owner, but the State law has not, until recently, provided that the record of such proceedings was evidence of any fact therein contained, nor does it now provide that evidence may be had to show that the proceedings had been annulled by due payment of the delinquent's proportionate share. To remedy this, a bill was prepared by the MINING AND SCIENTIFIC PRESS and presented to the last Legislature, but it was not passed.

Concentrates.

A CONTRACT for the erection of a smelter at Cerillos, N. M., for Captain Balue has been let.

THE Ontario Gold Mining Company has purchased the Ajax group of mines in the Slocan for $25,000.

A POCKET discovered in the Tanzy mine, near Sonora, Cal., a few days ago, is reported to have yielded $80,000.

FROM the Juneau mine, in Silver Bow basin, Alaska, $16,000 in gold was taken out in the first twenty days of the season.

EXPORTS of copper in June amounted to 13,129 tons and from January 1st, 62,223 tons, against 58,109 tons of the same time last year.

THOMAS KEARNS, representing the Silver King, has secured an option on the Union mine at Park City, Utah, for eighteen months at $50,000.

AT the Golden Gate mill at Mercur, Utah, which is to have a capacity of 800 tons daily, the Kendall dioxide cyanide process will be used.

THE lessees of the Unity, or Gold Flat mine, in Nevada county, Cal., are about to increase the capacity of the mill from five to ten stamps.

EVERY mill within hauling distance of Randsburg, California, is kept busy crushing ore, and more is being mined than ever before since the camp was started.

THE Nowell G. M. Co. writes that good rock miners can find employment in and around Juneau, Alaska. The Klondyke excitement is making miners scarce there.

AFTER an imprisonment of thirteen days without food in a caved mine at Goldfields, Phœnix, Arizona, James Sterms was rescued alive last Saturday and will recover.

A COMPANY has taken up, under the placer mining law, the islands in Great Salt Lake for their guano deposits. The first shipment will be made to California for sugar beet fields.

PHIL ARMOUR and other capitalists of Chicago have purchased a large tract of placer ground on the Snake river, Idaho, and it is said will operate it by means of a dry process.

SOME of the best gold properties of Cripple Creek are said to be in French hands. Foreign stockholders are even reported to have displaced a recent president of the Victor mine of that camp.

THE number of silver dollars coined at the United States mints during the last fiscal year was 21,203,701, on which the seigniorage or profits to the government amounted to $6,336,104.

THE Kootenay, B. C., Mining Protection Association is taking steps to urge the comptroller of customs to exercise his discretionary power and place more mining machinery on the free list.

THE silver yield of Mexico last year was estimated at $54,500,000, and it is claimed that there is a larger output being made this year, which promises to increase the total to $60,000,000.

A CUT in wages at Park City, Utah, in the Ontario and Daly mines, has been announced to go into effect August 1st, which is under discussion by the men as to whether they will submit or not.

RECENT discoveries of gold-bearing quartz at Hall City, in Trinity county, Cal., near the Harrison gulch mines, have caused considerable excitement and many people have gone in to prospect and locate.

A COPPER ledge is reported to have been discovered on the shore 400 miles west of Sitka, which is said to be 80 feet wide and 500 feet in length. It has been located for L. C. Dillman of Spokane and associates.

A RUSH of mud in the De Beers diamond mine, at Kimberley, Africa, last Saturday, entombed several Europeans and fifty natives. Twenty of the men were rescued, but it is feared the others perished.

UP to July 10 for 1897 the value of ore and matte exported from the Kootenay mines in British Columbia was $3,916,-286.80. Of this 27,378 tons was in ore valued at $1,933,245.70 and $1,983,040.10 in produce of smelters.

THE Southern Pacific Company have resumed work of boring for coal in the Gila valley, above Solomonville. Work of this kind has been going on for nearly two years, and, although no paying bodies have been found, good results are expected.

THE power plant of the Blue Lakes Water Company on the Mokelumne river is completed and light turned on in the towns of Mokelumne Hill and San Andreas. But its greatest importance probably will be in furnishing power for developing mines.

HUMBOLDT'S prediction comes true. Fifty years ago he said that some day great stores of gold would be discovered in the extreme northwestern part of America. Alaska is now one of the sections that thinks its gold yield for 1897 will exceed that of California.

INFORMATION comes from Juneau, Alaska, that rich strikes have been made on Minute creek, near Forty-mile, on the Yukon, and on American creek, forty miles down the river. Many miners are going to those places and relieving the strain in the Klondyke.

NEVADA AND COLORADO are no longer "silver States," the gold yield in '96 exceeding that of silver in each commonwealth. Montana is now the "silver State," though either Nevada or Colorado stands ready to dispute the title should conditions warrant the extraction of the white metal.

THE Tamarack copper mine of Michigan in June produced 1400 tons mineral, with 73 per cent copper, an increase owing to improved mill facilities. The product of the Atlantic mine was 291 tons 595 pounds, the Wolverine mine 107 tons 1700 pounds, the Franklin mine 147 tons 1710 pounds and the Central mine 25 tons.

A WASHINGTON dispatch says the director of the Mint has given assurance that if Seattle, Wash., will give a building and ground, an assay office will be established out of funds appropriated for the same purpose for Deadwood, S. D. If this cannot be done, legislation in the regular congressional session will be necessary.

THE copper situation in a sense is not favorable or likely to result in high prices soon for the metal, unless a decided change takes place in the home consumption, which is small, although there are reasons for believing that by and by there will be an increase in the amount of copper used here. In the meantime the output increases.

EDMUND HARVEY, of properties of the Consolidated Gold Mines of California in Butte county, Cal., reports that development of the mine is being pushed as rapidly as possible at the 700, 800 and 1000-foot levels, Banner mine, and 390-foot level, Amosky. The mill is running steadily. The hoist is erected complete and operations are in full swing.

A MORTGAGE was filed last week at Bakersfield, Cal., covering the twenty-eight miles of railway which the Randsburg Railway Company intends building. The purpose of the mortgage is to secure the payment of $300,000 in twenty-year bonds that the directors of the railway have ordered issued. The Rochester Safe and Deposit Company has taken the entire issue.

A JOINT proposal of bimetallism was presented last week on behalf of the United States and France, at a conference in London between representatives of France, the United States and Great Britain. The proposals were taken under consideration by the British Cabinet, and it is reported that an international conference will be summoned to meet in the United States, with Great Britain represented.

INCLUDED in the rush to Alaska are enough men of ability and experience to make a good leavening in any community. Like the trip to California in early days, it calls for endurance and pluck, and while many may go unprepared few men without pluck and perseverance will get in. A large majority may be trusted to care for themselves any where; none but the daring will go and none but the strong will survive.

GOLD, in the shape of a fine dust that will be blown about in the wind is found in a mine at Sawmill flat, Tuolumne county. It is found in cells in the quartz like honey in a comb and is reported to be 20.35 fine. In other parts of the mine the gold is coarser. In the gravel deposits of northwestern Colorado—lacustrine deposits—the gold averages about 1100 pieces to one cent. It, too, is much purer than ordinary gravel gold.

SHIPMENTS of iron ore are now greater than they have ever been in the history of the Lake Superior district. *Bradstreets* says more than 47,000 tons are being sent out daily from Duluth. The average monthly shipments for the remainder of the season, it is estimated, will be over 1,000,000 tons. It is expected that Minnesota, for the first time, will this year take first place as a shipper of iron ore, passing Michigan, which has held the place for many years.

THE California Debris Commission has received new applications to mine by the hydraulic process from the Mayflower Gravel Mining Company, in the Mayflower mine, near Forest Hill, Placer county, Cal.; from Dr. J. P. Welch, in the Pactolian mine, near Genesee, Plumas county, Cal.; from the Gold Bug Mining Company, in its mine near Georgetown, El Dorado county, Cal., and from E. D. Bowman et al., in the Eclipse and Boston claims, near Onion valley, Plumas county, Cal.

THE mail facilities in the Yukon region are being constantly improved. Under a contract made by the Department, which went into effect July 1st of this year, there is a monthly mail from Juneau by way of Dyea and the Chilcoot pass as far as Circle City. The service by way of St. Michael's for the remainder of this season is from San Francisco, July 28th and September 5th, and from Seattle, Augugt 30th. The Canadian Government also has a monthly service from Juneau by the overland route.

IN '49 to the Yuba; in '97 to the Yukon. The Alaska rush will bring political prominence to that country, insure a boundary line, create correct maps, relieve other places of congestion, cause great suffering and disappointment, and enrich a few. Scientific mining will find a way to work the quartz ledges when the surface gold is gone, and a new field for mining ingenuity is open. The arrival of so much gold creates wonder, but were one county in California to dump its yield for a year in one shipment it would exceed in value the million that the Klondyke sent down this week.

THE receipts of quicksilver at San Francisco for June were 1349 flasks. For the first six months of 1897 the receipts were 7309 flasks, against 16,705 in the corresponding period of 1896 and 15,357 in 1895. San Francisco exports of quicksilver by sea for June were 405 flasks—265 to Mexico, 120 to Central America, 20 to British Columbia. The exports for the first half of the year were 2647 flasks, of which 1874 went to Mexico, 720 to Central America, 33 to British Columbia and 20 to New Zealand. The exports for the first six months of 1896 were 8539 flasks, including 2500 flasks to New York and 3000 to Hongkong.

AT A meeting of the anti-Debris Association held last Tuesday in Sacramento the special legislative committee reported the result of their conference with a like committee of the California Miners' Association in San Francisco. The committee was instructed to continue the conference, and, touching the same point, a resolution was adopted to the effect that the sense of the meeting was that the association should make urgent efforts to secure adequate appropriations for the improvement of the navigable rivers of the Sacramento valley, and requesting the support of all the people in the State to that end.

AT a meeting of the council of the Kootenay Mining Protective Association held in Kaslo last week the following resolution was adopted: "That this association views with consternation the fact that the executive at Ottawa are in possession of the power to place, at any time, an export duty on ores, and this association desires to place itself on record as being of opinion that should such vested powers be exercised the effect will be disastrous to the infant 'quartz mining industry' of British Columbia, and practically ruin it with an amount of taxation it is at the present time unable to carry and prosper."

THE value of the Yukon gravel is not so very remarkable compared with much that was found in California in early days. In the Dardanelles mine in Placer county a single pan yielded $1800. Many others taken out of crevices produced nearly as much in other of the drift mines in the Forest Hill divide. But in the shallow placers of earlier days it was no uncommon thing to find from $100 to $500 in a pan. A present resident of Nevada City, Cal.—A. Isoard—got $912 from one panful on September 13th, 1850. He and his partners that fall took $164,000 from a piece of ground thirty feet square in their claim. There are others.

THE Daly West mine in Utah was, when a prospect, owned one-half by John J. Daly and the other half by Hearst, Haggin and Tevis and R. C. Chambers. Mr. Daly wanted to open it up, but the other interest would not agree. Then Mr. Daly incorporated his half—probably the only instance in the world where the undivided half of a mine is made a corporation in and of itself. This half so incorporated, they proceeded to open up and develop the mine under Mr. Daly's management, and he has made it a magnificent property. Now a suit is about to be instituted involving control. If the owners of the other half have purchased even a single share of Mr. Daly's stock in the market he will lose control.

NOT since '49 has such a gold discovery been announced as that this week from the icy North. The fact that it is not all talk, but that returning miners have brought such store of gold starts thousands up there. For over a year glittering stories have been told of that region, and the arrival of nearly $2,000,000 in gold confirms previous statements. It is in every sense a new field and its development will be interesting. It is a problem slow of solution, whether, after the surface gold is gone, the quartz resources of that section will ever be given attention. This paper advises its readers to think twice before starting for that country, and on no account to go this season, which is now too far advanced for any present hope of success.

MANAGER THOMAS EWING says of the Diamond Hill mine in Montana: "The ore body is from 140 to 150 feet wide in sulphides. We have opened the vein by crosscuts in a number of places and the narrowest point found was 120 feet. We have run a tunnel 1500 feet diagonally to the vein and 1200 feet are in ore, and I have no hesitation in saying that it is one of the largest bodies of ore developed by preliminary workings in the country. We place the average value of the ore at from $4 to $6 per ton, though we have obtained much higher values. We took out last year 25,000 tons of ore from the south end, 7000 tons of which ran from $12 to $13 per ton, yielding $84,000, the remaining 18,000 tons running about $5 per ton. Like all sulphides, the values run in spots. I have taken out and panned ore from the vein that will run $25,000 to the ton, and in some places it will run as low as $2, but the average is as I have stated. The developments show 2,500,000 tons of ore in sight, of which about 1,000,000 is an oxidized free-milling ore."

THE value of the pearls found during 1896 on the coast of the gulf of Lower California amounted to $350,000. Besides, there were also exported 5000 tons of mussel shells, the value of which was estimated at $1,250,000. The pearl fishing, with appurtenances, forms the entire occupation of the natives, and La Paz, the capital for this trade in the peninsula, exists exclusively upon this industry. Until a few years ago only native divers had been employed, and the greatest depth to which they could dive was 35 feet. Upon the introduction of the modern diving apparatus a depth of 180 feet was accomplished, and, while formerly the best divers could not remain longer than two minutes under water, a modern diver thinks nothing of staying for two hours at a depth of 100 feet, although at a still greater depth the stay is necessarily shortened on account of the volume of water above. The divers do not limit themselves to the pearl oysters, but whenever they come across a rare piece of coral or a new kind of mussel, they pocket these likewise.

THE Drum Lummon mine at Marysville, Montana, was a year ago reported worked out. To-day the force employed by the Montana Mining Company, the owners, is as large as it ever was and in a few days when the 60-stamp mill will be crushing ore again, the number of men in the company's employ will be larger than ever before in its history. There are now about 350 men on the pay roll of the company. Until last year the Drum Lummon mine was a steady producer almost from the time the English company bought the property from Thomas Cruse. Less than a year ago, both mills were closed down, as it was found they were keeping ahead of production. Since the development work has shown up large ore bodies and within a short time 120 stamps will be dropping again. In the meantime a cyanide plant has been put up to work over an immense quantity of old tailings. All this means much for other mines all over the West, for the history of the Drum Lummon is the history of other mines in Nevada, Colorado, California, Idaho and Arizona.

A SUIT involving $30,000,000 is in progress in the United States Court in Denver, Col. The plaintiffs are L. S. Ballou and A. McLain of New York. The defendants are C. B. Reed, J. F. Campion and others interested in the Ibex Mining Company of Leadville. Ballou and McLain were interested in claims adjoining the Little Johnny, embraced in the Archer Consolidation, of which Clinton B. Reed was made trustee. In 1890, a lease of the property for three years was granted to John F. Campion, who formed the Ibex Mining Company. The Little Johnny was purchased outright. In June, 1893, an extension for three years was asked, which was granted on condition that all of the other beneficiaries claiming to be former co-owners of claims included in the Archer Consolidation, gave their consent. This extension ran out June 29, 1896. The plaintiffs claim that the extension was illegal and that the property has been worked since June 29, 1893, without title, and they therefore ask that an accounting be ordered, and name the sum of $30,000,000 as the amount due them. The defendants' demurrer to the bill of complaint was overruled in the U. S. Circuit Court last Thursday.

THE American Institute of Mining Engineers met at Houghton, Michigan, July 12. Members were taken over the copper and iron properties and the meeting was concluded by a visit to the Black Hills, S. D. Papers were read as follows: F. C. Smith, Rapid City, S. D., "Potsdam Gold Ores of the Black Hills;" J. W. Pinder, Gold Creek, Nev., "Losses of Gold in Hydraulic Placer Mining;" B. MacDonald, Butte, Mont., "Hydraulic Classification of Battery Pulp and its Effect on Vanner Concentration;" E. S. Sperry, Bridgeport, Conn., "Influence of Lead on Rolled and Drawn Brass;" G. L. Heath, South Lake Linden, Mich., "Electrolytic Assay as Applied to Refined Copper;" M. E. Wadsworth, "Occurrence of Lake Superior Copper;" A. K. Reese, Baltimore, "Six Months' Working of Dover Furnace at Canal Dover, O.;" D. H. Bacon, Soudan, Minn., "Development of the Lake Superior Iron Industry;" C. E. Bailey, Virginia, Minn., "Mining Methods on the Mesabi Range;" E. J. Longyear, Hibbing, Minn., "Explorations on the Mesabi Range;" J. E. Jopling, Marquette, Mich., "Developments of Iron Ore on the Marquette Range;" J. Birkenbine, "Production of Mesabi Ores;" H. Ries, New York, "Clays and Clay Working Industry of California," "The Fuller's Earth of South Dakota;" R. Ingalls, New York, "Notes on the Tin Deposits of Mexico;" F. H. Newell, Washington, D. C., "The Investigation of Water Supply;" Prof. E. Kidwell, Houghton, Mich., "The Efficiency of Built-up Wooden Beams;" P. Wilkins, "The Cement Industry at Quanah, Tex.;" W. Kelly, Vulcan, Mich., "A Mine Dam."

John Dern on Mercur, Utah.

The following is a condensation of a paper read at the International Mining Convention at Denver, Colo., on the 9th inst., by John Dern of Mercur, Utah, on gold mining in that district:

The Mercur district is in the Oquirrh range of mountains, in Utah and Tooele counties, State of Utah. The town of Mercur is in Lewiston canyon, toward the northerly end of the district, in Tooele county. The altitude is about 6600 feet. The district has a population of 2500.

Twenty-five years ago, on the site of Mercur, there was a bustling, active town, nearly as large as Mercur is to-day. It was named Lewiston, and was a silver mining camp. As the result of finding some rich silver ore, a mining district was organized, called Camp Floyd mining district, after the nearest town. The ore was so pockety that it could not be made to pay. Lewiston disappeared and silence reigned.

This silence was occasionally invaded by the casual prospector, but nothing was developed. In 1880 Arie Pinedo, a German prospector discovered cinnabar and made a location, which he named the Mercur claim, Mercur being the German word for mercury or quicksilver. Some interest was manifested in the find, and others came into the neighborhood to find quicksilver mines. M. T. Gisborn located the Geyser, which is a gold mine to-day. Pinedo went to the expense of having his Mercur claim patented, but he found that the quicksilver was not sufficiently abundant to pay. He deserted the claim and left the country, and Camp Floyd district had for the second time been pronounced a failure.

What is now being worked as the gold ore in Mercur was not unknown in the earlier days. During the Lewiston excitement prospectors often brought samples of this rock into the camp. Though a fire assay showed that gold was present, it was invariably pronounced worthless, because no colors could be found in panning. Samples which were brought to Salt Lake City were also promptly condemned by local experts, and the finder was laughed at, or convinced that the stuff was no good. No one had ever heard of gold ore that could not be panned, and, as the closest scrutiny failed to reveal any gold to the eye, the assays were declared fraudulent.

Joseph Smith, now of the Geyser-Marion Mining Company, was prospecting in the district late in the eighties, and he became convinced that there was gold in the ore which he found there. He made a number of amalgamation tests and felt satisfied that the values could be saved. He began to take steps to organize a company, but could find no one in Utah mining circles who was credulous enough to listen to him. Finally he submitted the proposition to G. S. Peyton and H. W. Brown. These men had not the capital with which to develop the ground and build a mill, but upon examination they became thoroughly imbued with the conviction that the property was a valuable one, and June 4, 1890, the Mercur Gold Mining and Milling Company was incorporated.

After milling about 1500 tons and various changes had been made in the mill, it was fully demonstrated that the values could not be saved by that method.

They sent a small sample of the ore for a laboratory test to the Gold and Silver Extraction Company of America, Limited, at Denver. The report showed that the treatment had been satisfactory. A carload of the ore was then loaded and sent to Denver. The experiments on this lot were as encouraging as the first tests had been, and the company decided to install the new process. The old pans and settlers were torn out, to be replaced by five round iron tanks, having a capacity of seven tons each. The other necessary alterations were made, and soon the cyanide plant was ready for operation. Upon starting up, the exasperating discovery was made that, on account of the talcy nature of the ore, the solution would not percolate through it. All sorts of schemes were tried to make the leaching a success, but with no avail. The prospect was again gloomy, for this process seemed to have failed like the other. The company's funds had long ago been exhausted, and debts to the amount of many thousands of dollars had been guaranteed by the stockholders. After it was demonstrated that the leaching was not possible, the mill was closed down and experiments were renewed in the assay office. Several weeks were consumed in this work. All imaginable expedients seemed to have been resorted to, but still the obstacle had not been overcome. Finally, one day when the baffled workers were wondering what they could try next, Mr. Nesbit, who then had charge of the works, noticing the pile of coarse ores which had been thrown aside in quartering down samples, said: "I am going to try some of this stuff and see what the result will be." The patentees of the process had insisted that fine crushing was essential, and all experiments had so far been made in compliance with those instructions. This casual, almost accidental, test by Mr. Nesbit solved the problem of the treatment of the Mercur ore. He found that the percolation was perfect and the extraction very satisfactory.

Coarse crushing was now applied in the mill, and the tide of fortune at last began to turn. Additions to the mill were made, and the Mercur mine speedily took its place in the ranks of the producers. The debts were discharged, and in September, 1893, dividend No. 1, of $25,000, being 12½ cents per share on the capital stock of the company, was declared and paid. This month the thirtieth of these dividends is to be paid, which will bring the total up to a round three-quarters of a million.

As the Mercur continued to give evidences of prosperity, it began to dawn upon people that there was other ground in the district that might prove valuable. Mr. Smith and Mr. Scannell, two of the incorporators of the Mercur, had already organized the Marion Gold Mining Company, and were putting up a mill on that property. Soon an influx of prospectors began, and these were promptly followed by business men. Thus a new town was born on the site of the old town of Lewiston.

The ores of Mercur occur in different veins or ledges. The largest and richest of these is known as the regular Mercur vein, it being the one on which all of the original work in the Mercur mine was done. This ore sheet dips in a northeasterly direction, at an angle of 18° to 25°; it varies in thickness from 6 to 40 feet, easily averaging 15 or 18 feet. Cinnabar frequently occurs, and the presence of this metal is always indicative of good gold values. This ore carries no trace of silver. Its gold content runs from $3 or $4 to $40 per ton.

Fifty feet above this vein is the Ruby vein, so named because it was first exploited by means of the Ruby tunnel, in the Mercur mine. When this ore body was encountered it was believed to be the same vein as that which was had in the upper workings, but subsequent developments proved it to be a distinct layer. The ore is practically the same as in the Mercur vein, and, like the latter, carries no silver, but often contains cinnabar.

A hundred feet below the Mercur vein is what has always been called the silver vein. This is a hard cherty rock, very different from the gold veins. In the lower part of this vein silver is found, sometimes of high grade. The upper portion of the vein, or perhaps it is a deposit which overlies it, is softer and looks more like the gold veins, though it is quite dissimilar in some respects. This, however, seems to be another gold-bearing ledge. In the Geyser-Marion a good deal of it has been mined and run through the mill. The Geyser has opened it up sufficiently to be convinced that it is a valuable deposit. The lowest workings in the Golden Gate appear to be in this ledge, and it is reported that these developments in that mine are very gratifying to the management. In the Mercur this silver ledge has not been explored to speak of.

By means of a No. 5 Gates rock breaker, and two sets of Wall's corrugated rolls, they crush their ore to pass through a three-quarter mesh screen. The ore being uncommonly soft, of course the greater percentage of it becomes finer, and it is only the hard pieces that remain at this coarse size. They being interspersed through the ore, facilitate the leaching, as has been explained in recounting the early experiences.

The crushed ore is dumped into round iron tanks, each of fifteen tons capacity. Here the solution, which we keep at a strength of about one-fourth of 1 per cent cyanide of potassium, is turned on. Our method is to let the fluid percolate six hours, and then drain it off, repeating the operation until we have leached from 48 to 60 hours. Our extraction ranges from 80 to 87 per cent in our regular work. We precipitate our zinc shavings. A clean-up is made about every two weeks. We dry the slimes in a retort, then pulverize them and ship them to the refinery. We have at various times attempted to refine our product, but some of its ingredients render it more or less refractory to the ordinary methods, and our attempts have not been successful.

The Mercur mill is treating 300 tons per day at a cost of not to exceed 80 cents per ton. The Geyser-Marion Company, whose ores are still more silicious, are milled at the extremely low cost of 70 cents per ton. At all events, it is unquestionably a fact that the regular Mercur ore—that which is called the oxidized ore—can be very cheaply treated by cyanide process. In the first place, the coarse crushing, which is essential, rather than answerable, obviates the necessity for expensive crushing machinery, and reduces to a minimum the labor in this department. Then the small percentage of cyanide needed to extract the gold gives Mercur an advantage over most other camps. Nearly all of the mines are perfectly dry, so there is no pumping to be done. A railroad runs into the camp, and supplies can be obtained at reasonable prices. The Gold Belt Water Company's pipe line supplies the town of Mercur and the mills in that vicinity with water, which is brought from Ophir creek, three miles north.

The boomers, who asserted that the whole country for miles around Mercur was underlaid by an immense blanket of ore, and that it could be struck anywhere and would be rich wherever found, claimed that which has never yet come to pass in any country at any time. Mercur is a legitimate mining camp and the saying that "Gold is where you find it" is as true there as anywhere else. Not every man who owns a claim has a bonanza. If he had, gold would soon be demonetized, and lead or some other more valuable metal substituted for it as a medium of exchange.

The history of this camp demonstrated that what is impossible this year may be possible next year, and the rock which is now utterly useless and intractable may, by a very simple discovery or process, become extremely valuable. Just as the despised rock of the Camp Floyd district has, by the application of cyanide, been transformed into a source of great wealth, so it is possible that in other fields there are ores which are now accounted valueless, but which, with the advances that are now being made in metallurgy and the treatment of ores, may some time become productive.

Work of the United States Geological Survey.

The plans of operation of the United States Geological Survey for the fiscal year 1897-1898 have been approved by the Secretary of the Interior and the work of the field season of 1897 has been started, the parties having all taken the field. The sums appropriated for the Survey this year make the aggregate amount for the fiscal year 1897-1898 $967,840, a decided increase, though the additional sum does not go to the geological branch.

For convenience in administration the work of the Survey is divided into four branches, each of which is again separated into a number of divisions. The branches are geology, topography, publication and administration, geology and topography being the main branches.

In geology the field work extends all over the United States, from New England to the Pacific.

Seven parties have been sent to the interior Mississippi region, and five to the Rocky mountain region which lies between the British and Mexican boundaries on the north and south, the margin of the great plains on the east and, approximately, the line of the 119th meridian on the west, and embraces the Rocky mountains and their foothills. Mr. Arnold Hague is in charge of one of these parties, which will do the work necessary to enable him to complete his monograph on the Yellowstone National Park. This was interrupted by his work on the Forestry Commission of the National Academy of Sciences last year. Prof. Hague will survey the Absaroka range, one of the most rugged and inaccessible of the Rocky mountains. Dr. W. H. Weed will continue the study of ore problems, etc., in Montana.

Mr. S. F. Emmons will be in Europe the greater part of the season, but under his direction surveys of the Tintic mining district of Utah will go on.

The Pacific region is covered by five parties, but the appropriation of $5000 made for work in Alaska was not passed in time to be available during the present year.

The paleontologic work is to be continued on the same lines as during the last year.

It is also proposed to continue the collection and publication of data touching the mineral resources of the United States. Dr. D. T. Day has direction of this work, and $20,000 has been specifically appropriated for it.

One hundred and seventy-five thousand dollars has been allotted for the topographic surveys proper and $150,000 for forestry surveys, and the plan of work will not be changed in character and organization from that of last year, except that additional work is imposed by the survey of the forest reserves.

THE production of aluminum in the United States during the year 1896 was 1,300,000 pounds, as against 900,000 pounds in 1895, showing a gain of 400,000 pounds, or 44 per cent. As has been the case for several years past, the entire domestic output came from a single producer, the Pittsburg Reduction Company, whose plant at Niagara Falls has been enlarged and has been working at nearly full capacity. It is interesting to note in this connection that the United States has up to the present time produced more than one-third of all the aluminum manufactured in the world. The principal European producer is the Aluminum Industrie Gesellschaft, with works at Neuhausen, Switzerland, and controlling the Societie Electro-Metallurgique de France, with works at Froges, in France.

THE longest distance ever encompassed by the human vision, so far as records go, is 183 miles, between Uncompahgre Peak, in Colorado, and Mount Ellen, in Utah. This feat was accomplished by surveyors of the United States Coast and Geodetic Survey in making a new measurement of the earth. Observers on this coast have been able to signal from Mount Shasta to Mount Helena, a distance of 190 miles, but have never been able to get a response. Between the two other peaks communication has been continuous for an hour or more on several occasions. Uncompahgre Peak is 14,300 feet in height, while Mount Ellen is 13,400 feet. The longest distance that the human eye ever reached until this record was made was between Algiers and Spain, 168 miles.

A New Mexican District.

Written for the MINING AND SCIENTIFIC PRESS by J. D. BONE.

In the northern part of the Members or Black Range of mountains in Sierra county, New Mexico, and about fifty miles west from Engle, a station on the A., T. & S. Fe railroad, lies a section of country of interest to the geologist and mining man. This mineralized belt extends from Grafton on the north to Cook's peak on the south, a distance of over 100 miles, but only that portion of it embraced within the Apache and Black Range mining districts will be considered in this article.

Traversing through the Black Range and Apache districts, in a north and southeast of north and west of north direction, through the high spurs of the mountains and cropping boldly through the porphyry and limestone cap is seen a remarkable belt of mineral outcropping. Like stone fences they can be traced for many miles across the country and in many places for long distances they arise fully 20 feet above the surrounding country. At one point the vein forms a vertical strata on the side of the cliff to a height of 100 feet, showing many thousands of tons of fair average ore all ready to be quarried and reduced.

The geology of both districts is made up of red stratified quartzite, but principally of gray and greenish-gray porphyry capped and flanked in many places by a hard, fine-grained, crystalline limestone. This limestone is also seen breaking through the country in the manner of ribs or dikes, distorted and thrown from its natural horizontal bed by the erratic outcroppings of porphyry, and subsequently highly crystallized by the metamorphic heat and is remarked throughout these districts in a very disturbed state, but in many places still retains its natural stratification.

Breaking through the porphyry and across the stratification of its limestone cap, and in contact with both, this remarkable belt makes its appearance, presenting to the geologist a most interesting and remarkable series of true fissures, filled with a quartz matrix. Their persistant structure and bold outcropping through and across the stratified limestone cap, leaves little doubt of their deep-seated nature. The veins vary from a few feet in width to over 40 feet of solid quartz, carrying pay streaks from a few inches to over 6 feet of gray copper ore, argentiferous, with native silver, chloride of silver, and gold, more or less disseminated throughout the mass.

There are exceptions to this, however, notably among which are two claims in the Apache district, known as the United States Treasury and White Eagle, both worked to a depth of 140 feet, showing on the 100-foot level a body of ore more than 24 feet wide—hanging wall not yet disclosed—and giving an average value in gold of one-half ounce or $10 per ton for the full width, while there are ore streaks 10 inches wide that will give values into the thousands. The gold is largely free, as is the case with a number of claims about Grafton in the Black Range district, namely the Great Republic, Emporia, Ivanhoe, Rock Gold, Elephant, Polar Star, and others, whose principal value is gold, as has been fully demonstrated by shipments to the different centers of reduction. In traveling about in these districts a feature is presented that is rarely found in any other mining region of the United States, and a condition which at once impresses the beholder is this, that no claim within an area of thirty miles long by over three miles wide, upon which any work is done, fails to show ore of greater or less value, and many of them of great value, as is attested by smelter and mill certificates of the product.

Prof. F. A. Reynolds says, in writing of this country, that "it is especially interesting in the character of its porphyries, every known kind of which enters into the formation of the mineralized section; that it is marked by many volcanic cones capped by phonolite, and the country from which these cones emerge is one vast field of porphyry, andesite and rhyolite predominating, interspersed with many kinds of crystalline rock coming under the name of quartz porphyry."

I find this especially the case in the Black Range or northern district, where dikes of the harder kinds of porphyries cut through deposits of softer porphyries, and along the lines of contact the ore chutes and channels occur.

The general strike of the veins, as stated, is north and south, but in places, notably one, the trend is disturbed and the veins seem to converge toward and radiate from an isolated peak of igneous formation, know as "Hagen's peak," and at one time the center of great eruptive disturbances. This cone seems to be the center of this vast mineralized deposition in the Apache district. The convergence of so many strong and highly mineralized veins make it a great central point of attraction, a sort of "mineralized hub" to the whole system radiating from it, and where they meet and cross each other in this peak great mineralization will be expected to follow, from the theory that great mineralization occurs at the junction of one or more mineral-bearing veins.

Work in these districts has been almost entirely confined to the immense quartz veins that mark the contact of the igneous with the rudimentary formation, but what limited prospecting has been done on these porphyries has given very satisfactory results, proving that great and sure value will yet be found in this formation.

Nature has especially fitted these two districts for the prosecution of mining enterprises. In the midst of a well wooded and watered country whose mineral zone is cut across the formation at right angles by broad canyons, these bold outcroppings offer exceptional economical tunnel entrances for a more thorough exploration of their mineral character. Many properties which from the amount of high and low-grade ores now exposed on the dumps and in the underground workings puts them beyond mere prospects, and mines now being developed and awaiting the advent of capital, is sufficient to make these mineral depositions of importance.

At the present time there is in operation a small five-stamp mill which works almost entirely on custom ore brought in by the various miners of the two districts, and as the results have proved so satisfactory a number of leases have been taken upon claims which heretofore were only worked for their silver values, but which now can be profitably operated for the gold.

The Horseflesh Business in Oregon.

It seems that the horse butchers of Oregon are developing considerable speed in their business and are now indulging in the highest kind of anticipations. It is reported from Portland that the Portland Horse Packing Company, whose plant is located at Linnton, employing eighteen men, is now doing a thriving business. The company some months ago received an order for 5000 barrels of cured horse meat from dealers in Paris, France, and the contract is now being filled. The plant, which has been idle since last fall, was started up again about four weeks ago and since that time 800 horses have been slaughtered. Fifty were killed yesterday. Each barrel is labeled "horse meat," and is thoroughly inspected by an inspector sent here from Paris. The Paris purchasers, before making this contract, had the plant thoroughly examined and satisfied themselves that the products would be up to the required standard. Parisians were the first people to adopt horse meat as an article of food, and the demand for it in the French capital is constantly increasing. The horses for the Linnton plant are procured from Eastern Oregon and are what are known as cayuses, worth in the market about $2 50 a head on the average. There is an abundant supply to draw from and the sooner they are cleaned out the better.

The horse packing company expects to build up a large business with Paris dealers and hopes also to find a market in Japan and China. Every part of the horse is utilized in some way. The choice meat is cured and all other parts, including hair, hide, bones, and even blood, are used for commercial purposes.

How It is Done.—We find in an exchange a description of the present work in Oregon, credited to a Stockton man who recently visited Linnton. His account is not appetizing, but it has a businesslike swing about it, nevertheless: "Played-out horses are bought up at $2 50 a head and slaughtered as fast as a man can hit them with an ax. The slaughter house is constructed after the style usual where beeves are killed, the horses being driven into a pen, from which they pass through a narrow way to the axman. As soon as the horse falls under the blow, the carcass is dragged away by a dummy engine. The tail is cut off to bleed the body, instead of bleeding from the jugular vein, as in the case of beeves. The hide is slit open, hooks attached to a rope connected with another dummy engine are inserted and the animal is skinned in a jiffy. The carcass is then cleaned and cut up, all the bones being removed, and the meat is thrown into a pickling solution. When properly cured, it is barreled and sent East, ostensibly for the European market; and it is sold as corned beef. Eight thousand head of horses have been slaughtered and marketed since the business began, which was a year and a half ago. Most of the horses slaughtered are superannuated ones, but colts only a few days old are also killed. The proprietors of the business say that as soon as the supply runs short in Oregon they intend to draw on California."

THE use of petroleum refuse for steam generation on Russian railways is rapidly extending, and over 100 per cent gain has been recorded in the last few years. Recent investigations show many advantages possessed by petroleum residue for locomotive firing. The method of burning the refuse is to pulverize it by jets of superheated steam, concentric, flat and annular pulverizers all being used. From 3 to 5 per cent of the steam generated is used in the pulverizers, but, as the evaporative power of the petroleum is found to be fully 50 per cent greater than that of coal, the net gain is considerable. The liquid fuel is convenient to handle and is prompt in response to sudden demands for steam.

Rules to Govern Forest Reserves.

Much attention has been paid recently by the General Land Office to the preparation of rules and regulations applicable to the government of all the various forest reserves of the United States, of which there are several in California, and Commissioner Hermann has now formulated these for the approval of the Secretary of the Interior, as follows:

Attention is called to the matter of forest fires, which annually do so much damage through carelessness, and the law is especially referred to which imposes a penalty for willfully setting fire to timber or carelessly suffering fire to burn unattended near any timber, and which punishes such offense by fine or imprisonment. The law provides that before breaking camp fires shall be totally extinguished.

Prospecting, locating and developing the mineral resources of forest reserves are permitted. Lands for schoolhouses and churches are provided, and the use of waters for domestic, mining, milling and irrigating purposes is also allowed.

The construction of wagon roads is authorized, and the right of way across the reserves for irrigation canals, ditches, flumes and reservoirs is permitted. The pasturing of live stock on the reserves is permitted except as to sheep, which, in view of their injuries to the forest cover, are prohibited in regions where the rainfall is limited, and the present exception in this regard is extended only to the reserves in the States of Oregon and Washington, because of the continuous moisture and abundant rainfall of the Cascades of the Pacific coast roads. Even there permission must be had, which will be revoked if pasturing extends to Bull Run reserve, Crater lake or places where injury may be done.

Where persons have unperfected bona fide claims within the reserves they may relinquish the same and select vacant public lands elsewhere without charge, in cases where previous fees had been paid.

The mineral lands of the forest reserves are subject to location and entry under the mining laws in the usual manner. Owners of mining locations are authorized to fell and remove from their mining claims any timber growing thereon for actual mining purposes upon their particular claim. The free use of timber is allowed to bona fide settlers, miners, residents and prospectors for minerals, for fire wood, fencing, buildings, etc. This privilege is restricted to persons resident within the forest reserves who have not a sufficient supply of timber on their own claims.

The sale of timber from the reserves will be permitted in limited quantities for the purpose of preserving the living and growing timber and permitting the younger growth of timber on the reserves to develop. Dead, matured or large growths of trees found upon the reserves shall be designated and appraised so far as the same may not be necessary for the forest preservation and water cover, and may be sold for not less than the appraised value in such quantity as shall be prescribed to each purchaser and to be used in the State or Territory in which the reservation may be. Sixty days' notice, published in the county where the timber is situated, is to be given before sale. Payments are to be made to the Receiver of the local Land Office of the district wherein the timber is sold. Before the sale the timber shall be examined and appraised under the direction of the Department. In order to avoid a monopoly, the Department may, in sales in excess of $500, make allotments of quantity to the several bidders, and the right is reserved to reject any or all bids. Within thirty days after an award of timber to a bidder payment must be made in full and within one year it must be removed. Where it may be found necessary to erect temporary sawmills, a permit will be necessary. All timber so cut must be used in the State or Territory in which the reservation is situated.

Supplemental instructions are given to all special agents of the Interior Department to especially take cognizance of unlawful cutting of timber and depredations upon the public domain, including the forest reserves, and hereafter a vigilant watch will be directed toward the matter of forest fires.

In the case of lands more applicable for mining and agriculture than for forestry purposes, upon a proper showing made, the same may be eliminated entirely from the forest reserve and restored to the public domain.

As to the forest reserves which have lately been suspended by the recent act of Congress, the geological survey is now busily engaged in examining them and in extending the exterior lines properly embracing the reserves. In this manner large portions erroneously heretofore embraced in reserves will be restored to public entry, and other portions, which were omitted from the reserves, will be embraced within them.

The estimated area of the existing forest reserves is 18,993,280 acres. The estimated area of the suspended forest reserves is 19,951,360 acres. The aggregate area of the existing and suspended reserves is 38,944,640 acres. This is greater than the area of any State east of the Mississippi river and of several west of it.

The Alaskan Placers.

Last week there came down from the Yukon placers two steamers bringing a few returning miners and about a million and a half in gold. As a consequence, many thousands throughout the country are endeavoring to go into the new El Dorado, and a greater excitement has been created than by any other gold discovery since that of 1849. The Excelsior arrived in San Francisco on the 15th, bringing in bullion carried by about a dozen returning miners and by the Alaska Commercial Company—some $730,000. The following list gives an approximate idea of the money brought down: Alaska Commercial Company, $250,000; T. S. Lippy, $65,000; F. G. H. Bowker, $90,000; J. McMann, $15,000; J. O. Hestwood, $10,000; J. Ladue, $10,000; J. Fox, $4,000; A. Krook, $20,000; J. Marks, $10,000; B. Anderson, $10,000; A. Orn, $20,000; C. Galbraith, $20,000; H. Cook, $20,000; L. Rhodes, $45,000; J. Ernmerger, $10,000; F. Lendesser, $10,000; T. Flack, $20,000; N. McArthur, $20,000; A. F. Stewart, $22,000; J. Hollinsead, $22,000; M. S. Norcross, $12,000; C. A. Stamatia, $5,000.

The steamer Portland arrived at Seattle, Wash., on Saturday, the 17th inst., bringing over $1,000,000.

The new discoveries made on the Klondyke river last August, and reported at Forty Mile and Circle City about the first of this year, are the source of the largest part of this gold. The accompanying sketch will show the Klondyke river to be within the British possessions. The gold fields are indicated by a square. As will be seen, the Yukon is fed by many smaller streams both in Alaska and far up into the British Northwest Territory. In all of these gravel deposits are found carrying gold. Forty Mile, Seventy Mile and American creeks were attracting most of the attention of the miners along the Yukon until about the first of the year, when reports of rich discoveries on the Klondyke were brought down and most of the miners found their way up the river to the new diggings. There were about 1200 wintering in the country, and since then at least 2500 more have gone in.

Reports as to how rich the Klondyke placers were did not arrive here in time to increase the number who went in this spring. Now all is changed. There is no uncertainty. That the gravels of the Klondyke are as rich as any ever found in the world there can be little doubt. However, it would be ridiculous to suppose that one-tenth of the men who are now going in will find claims in the rich field. It is probably safe to say that of the 3000 miners now on the Yukon not ten per cent will make any considerable fortunes, and but a small proportion of the rest will make more than wages.

There is likelihood that new districts will be found and room found for many of those who will rush in and possibly all of them, but at best it is a gamble. Such was the history of California in early days and of Australia, but few made piles.

There is danger that there will be a stampede that will cause considerable suffering during the winter and spring, but people who are careful and go properly prepared need fear no danger. One of the experienced men who have returned says that no one should venture into the region without some cash and a sufficient supply of provisions to last eight months. One should buy these things in Juneau, and he should start out with something like the following: Four hundred pounds of flour, 100 pounds of beans, 100 pounds of bacon, 100 pounds of sugar, 10 pounds of tea, 30 pounds of coffee, 150 pounds of mixed fruit, salt, pepper and cooking utensils. The whole outfit can be purchased, well, within $90. The cost of conveying this stock of provisions to the headwaters of Lake Lindermann will average about $15 per hundred, but even that makes it considerably cheaper than the same goods could be purchased in the mining camp. On the trip from Juneau the Indians are employed in the heavy work. They are paid from 8 to 25 cents a pound, but the average is 15. The credit system has been entirely done away with in Dawson. No one can make a purchase of any kind without the necessary cash in the shape of dust. Of course, it must not be understood that they would let a man starve, but, on the other hand, no one must expect to be supported by the generosity of the people.

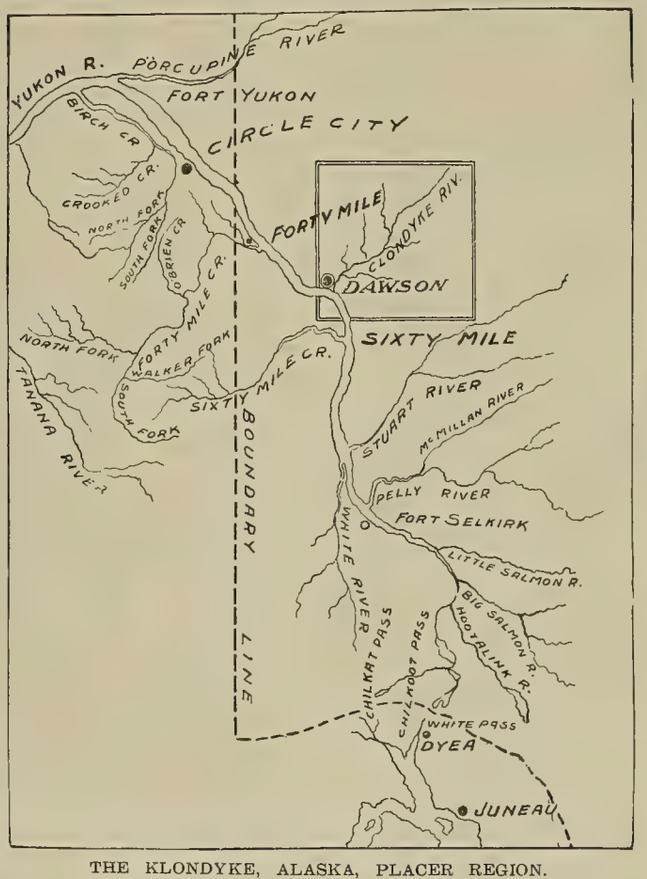
The steamship companies will send in probably only three steamers this year and will, of course, accommodate but a small proportion of those who wish to go.

There are two routes by which to reach Dawson City, the town of the Klondyke fields. One is by steamer and the other overland from Juneau. By the former it costs $150 from San Francisco, a forty days' trip. This is the easier way, but the longer one. The distance is roughly estimated at 4600 miles.

It is doubtful if one-twentieth of those who would like to go to Alaska this year can be accommodated. The Alaska Commercial Company will only send one steamer through to the gold fields, and the Pacific Transportation Company will endeavor to push two steamers up the Yukon to Dawson City before the ice comes.

The Juneau route is the cheapest, but it involves considerable hardship and will be open only until about September 15th. Steamers go to Juneau and from there the passengers are taken to Dyea, which is shown in the accompanying map, by river boat. From there the traveler must go afoot to Lake Linderman, a distance of thirty miles, and for a moderate sum an Alaska Indian will carry the prospector's pack.

At the lakeside in the spring the traveler must buy or build a small boat. In the winter he must hire a sleigh. There is a boat builder at the edge of the lake who constructs light craft. The boats are seldom used except to carry baggage, as it is safer to tow them along the lakeside. From one lake to another passage is comparatively easy by the connecting streams. White Horse lake and river are reached first. The only difficult part of the journey is in what is called "the canyon." Sometimes the boat has to be towed along at a considerable distance below the traveler, who walks on the bank high above. The walking is none of the best because of the rocky nature of the ground.



THE KLONDYKE, ALASKA, PLACER REGION.

From the seaport town to Circle City by way of the Klondyke region the following are the distances:

	Miles.
To Haines (Chilcat mountains)	80
To Dyea	100
To head of canoe navigation	106
To summit of Chilkoot pass	114¾
To head of Lake Linderman	123¾
To head of Lake Bennet	128½
To foot of Takish lake	178¼
To head of canyon	223
To head of White Horse rapids	225¼
To Tahkeena river	240
To head of Lake La Barge	256
To Hootalink river	316
To Big Salmon river	349
To Little Salmon river	385½
To Five Fingers rapids	444
To Rink rapids	450
To Pelly river	503¾
To White river	599¼
To Stewart river	609
To Sixty-mile post	629
To Klondyke	678
To Fort Reliance	682½
To Forty-mile post	728
To Fort Cudahy	728¾
To Circle City	898

As to the mines themselves, those so far discovered are shallow placers of recent formation lying along the creeks. Owing to the coldness of the climate, the ground is frozen the year round and must be thawed out by fire in order to work. The system in vogue is in principle the same as that in the great Siberian placer fields, which are very much the same as those of Alaska.

The Siberian diggings are of two classes—summer and winter. Most of the creeks have a slight fall and wide bottoms, the gravel being covered by 1 to 10 feet of muck, or soil (not glacial drift). The bedrock is often 20 feet deep, and since the ground never thaws more than 2 or 3 feet from the surface, drains and ditches are expensive, so each winter more "burning" is done, which consists in thawing the gravel by fire, removing it and repeating. The muck thaws but little, and makes a good roof for drifting. The dumps are sluiced with the first water in the spring. Summer diggings are expensive to open for work, but the net returns are often more than if "burning" had been the method. In most cases lumber must be whipsawed, the average cost being $150 per thousand feet. Other things being in proportion, considerable expense is incurred before the ground is ready to shovel into the sluice boxes.

A glance at the map of Alaska and the Northwest Territory, in which these mines are located, will show that there is an immense extent of country that has never been explored. Now that the prospector has gone to blaze the way, every stream and mountain will soon be properly located on the maps, and if there are any resources of wealth besides mineral in any part of it the miners will be the cause of making them valuable.

The mines so far discovered are the gravel deposits in an area of country small compared with all that in which other deposits may be found. But little attention has been paid to quartz, particularly as the hills and valleys are covered by a heavy growth of moss. So far nothing but small stringers have been found in the bedrock. Nuggets are often found which are more than half quartz.

As far as any thorough prospecting is concerned, the basin of the Yukon has hardly been entered. The main river winds through a distance of 3000 miles and its tributaries vary in length from 60 to 300 miles. That there are possibilities of discoveries of much more wealth cannot be doubted, but to the prospector it is a most inhospitable region, not only on account of the dangers and hardships, but because the ground is covered with arctic moss or snow and frozen, making the discovery of quartz or other deposits extremely difficult.

Plans for the University of California.

Regent J. B. Reinstein of the University of California has returned from Europe, where he went three months ago, accompanied by H. E. Maybeck, instructor in architectural draining, to inspect university buildings and consult with prominent architects as to the plans for the new buildings to be erected at Berkeley. The architects generally regard the opportunity presented as one of the greatest ever offered in the history of architecture, for, in addition to the beauty of the site, the large area of the grounds, and their situation on a gently rising hill overlooking the Golden Gate, Mrs. Hearst has not restricted the amount of money necessary to obtain these plans.

Mr. Reinstein states that there will be an international concurrence of architects, together with artists, sculptors and landscape gardeners, to bring about the best results. Prof. Gaudet of Paris, who has probably had the most extensive experience of any person living in this direction, is preparing the "programme," as it is technically called. This will give in detail the requirements of the University, together with the necessary data, maps and photographs, and will be finished within a month, when copies will probably be sent to the various architects of the world.

Under the arrangements as contemplated at present the architects will be requested to send in sketches of their plans at a given date, and these will be passed upon by a jury consisting of one recognized authority each from France, Germany, England and the United States and a representative of the University, the understanding being that each architect submitting plans will receive some recompense. At least ten of the best sketches will be selected by the jury and the authors will be requested to elaborate their plans. The architects so selected will be permitted to name four additional members of the jury, and these nine jurors will select the ultimate plan. It is probable that there will be about thirty magnificent buildings in all, each of which will be built of marble or other stone. The completion of the work is not expected for many years.

The Transmississippi Congress.

There were about 400 delegates in attendance at the Transmississippi Congress in Salt Lake last week. Delegates were present from every State and Territory west of the Mississippi river. Hugh Craig of San Francisco was chosen temporary chairman, and at the second and third days' session Wm. J. Bryan presided. H. R. Whittemore of St. Louis, Mo., was appointed chairman of the Executive Committee.

On Wednesday, Lorin A. Thurston and W. A. Kinney addressed the Congress on the question of annexing the Hawaiian islands. Addresses of welcome were delivered by Governor Wells of Utah and Mayor Glendenning of Salt Lake. Resolutions were introduced as follows:

By Ford of California urging the creation of a Department of Mines and Mining.

By Walsh of Wyoming favoring the annexation of Hawaii.

By Patterson of Colorado declaring that the pending mining strike in the Eastern States proved the necessity for the creation of a national board of arbitration.

By Black of California urging Congress to provide for the speedy construction of the Nicaragua canal.

By Thompson of Nebraska favoring a daily fast mail train between the Atlantic and Pacific coasts, which would not be subject to delay at Chicago or elsewhere.

Other resolutions were introduced in the interest of forestry reservation and the beet-sugar industry.

The resolutions committee was composed of the following delegates: T. M. Patterson, Colorado; T. L. Ford, California; J. H. Richards, Idaho; E. F. Test, Iowa; J. H. McKnight, Kansas; B. Smith, Louisiana; J. M. Reed, Montana; E. V. Smalley, Minnesota; J. M. McMichael, Missouri; G. W. E. Dorsey, Nebraska; S. Bradford Prince, New Mexico; L. H. Taylor, Nevada; A. J. Levy, Oklahoma; A. J. Keller, South Dakota; G. B. Stone, Texas; T. D. Lee, Utah; J. P. DeMattos, Washington; J. A. Holliday, Wyoming.

The Nicaragua canal question was discussed by Prof. S. W. Waterhouse of the Washington University, St. Louis, and Hugh Craig of San Francisco.

On reassembling on Thursday, Wm. J. Bryan was present and took the chair, when he said in part:

"I am in hearty accord with the purposes of this Congress. We have here a vast empire whose interests are in many respects dissimilar to those of the rest of the country, and much benefit can be made to accrue from the deliberations of this body. We do not want to secure advantages at the expense of the rest of the country, but only to secure what rightfully belongs to us. In traveling through this region I am impressed with the great mineral wealth it contains."

Mr. Smalley of Nebraska offered a resolution, which recited that the public lands were being injured by overgrazing, and asked the congress to cause them to be resurveyed, classified and placed on sale under regulations which should be more liberal than the present land law.

Mr. Gibbons of Nebraska offered a resolution reciting the reasons why a deep-water harbor should be constructed at San Pedro, southern California.

Mr. Prince of New Mexico introduced a series of resolutions providing for home rule in Territories; the extending to Territories of the benefits of the Carey land law, and providing for the creation of a Government Department of Mines.

Mr. Dorsey of Nebraska introduced a series of resolutions favoring the beet-sugar industry and the granting to the several States of the public lands within them under such restrictions as would prevent monopoly.

A resolution favoring the taking possession by the Government of the Pacific roads was introduced by a delegate from Nebraska.

Tirey L. Ford of California addressed the convention in favor of an executive Department of Mines. Judge Royal of Colorado followed and the resolution was adopted.

Resolutions reported by the committee were adopted in favor of Hawaiian annexation, building the Nicaragua canal, recognition of Cuban independence, arbitration under action of Congress to settle the present coal strike and urging action by Congress for the encouragement of the beet-sugar industry.

The report of the majority of the committee declaring in favor of the free and unlimited coinage of both gold and silver at the ratio of 16 to 1 was debated at length and finally adopted by a vote of 204.6 to 46.4.

On Saturday, Mr. Craig tendered his resignation as president in view of the adoption of the free-silver resolution on the ground that he could not consistently act while opposed to the sentiment of the congress. His resignation was declined unanimously.

The Committee on Resolutions reported favorably the San Pedro harbor resolution and it was adopted by a practically unanimous vote.

Vice-presidents from the States were named as follows: Arkansas, B. D. Williams; Arizona, J. J. Hawkins; Colorado, W. H. McClure; California, Wm. Johns; Idaho, E. S. Hart; Iowa, A. R. Garrell; Kansas, W. P. Dillard; Louisiana, Breedlove Smith; Montana, Wm. Thompson; Minnesota, D. T. Adams; Missouri, John Doniphan; Nebraska, W. I. Kiersted; New Mexico, A. S. Goetz; Nevada, W. P. Maxon; Oklahoma, A. J. Seay; South Dakota, C. E. Jewett; Texas, G. P. Zimpleman; Utah, T. W. Shurtleff; Washington, Geo. Hazard; Wyoming, J. R. Arnold.

Resolutions were adopted favoring the Free Homes bill, the improvement of Pacific coast harbors and a deep-water harbor at Galveston and indorsing the Pure Food bill.

A resolution introduced by Mr. Bryan favoring the foreclosure of the Pacific railroad liens was adopted.

Wichita, Kansas, was chosen as the place for holding the congress next year.

Mr. Preston's Explanation.

R. E. Preston, Director of the Mint, has given out as his final figures for the gold yield of California for 1896, $15,235,900. These figures were made up in Washington. On the ground here the United States Mint has employed a statistician of acknowledged ability, who has for a quarter of a century been familiar with this work. Besides the machinery of the Branch Mint of San Francisco, he has the assistance in gathering data of the State Mining Bureau, and also every source of information available to Mr. Preston. His report, which was recognized by all those familiar with the subject as conservative, returned the gold output of California for 1896 at $17,181,562.

Now Mr. Preston, in a letter to Congressman De Vries, makes the following explanation:

"The difference, namely, $1,945,662, between my estimate of the gold product of California for 1896 and that of Mr. Yale is due to the fact that he bases his estimates solely upon information furnished by superintendents and owners of mines, postmasters, express agents et al., while the estimate of the Bureau of the Mint is based upon the deposits of crude gold at the mints and assay offices, identified upon information given at the time of deposit as produced in California, and from the reports received from private smelting and refining works in the United States, giving the amount of their product derived from the ores mined in California in 1896.

"During the calendar year 1896 the deposits of crude gold at the mints and assay offices of the United States credited to the State of California were 145,304 fine ounces, while the returns from private refineries showed the quantity of gold derived by them from California ores as 576,359.

"In addition to the deposits of crude gold at the mints and assay offices and the amount returned by private refineries as the product of California there were 50,497 fine ounces entered as of domestic production, of which no definite information could be obtained as to the respective States to which it should be credited. It was therefore necessary to distribute this amount among the producing States and Territories, and 15,374 fine ounces of the same were allotted to California, making the total gold product of that State for 1896 737,037 fine ounces, of the value of $15,235,900, the same being the amount of my estimate. Experience has shown that the reports of superintendents of mines and mine owners are not a safe basis upon which to estimate the gold and silver product, as there is a disposition to magnify the product by estimating the same at the assay value of the ore extracted, although much of it may be of so low grade as not to warrant the expense of working, such ore remaining on the dump, and therefore nothing being added to the stock of gold and silver by the extraction of ore of this character."

In regard to this Mr. Yale says: "I do not wish to be construed as criticising either Mr. Preston or his estimate. We figure from entirely different standpoints and both are correct in the main. The Department at Washington counts only the gold that reaches the mints and assay offices. My estimates on the other hand are based on the figures of mine owners and people who keep closely in touch with mining men. It must be remembered that thousands of dollars are taken out of the ground every year in this State by Chinese and then shipped immediately to their own country. I have a record of this, but the Director of the Mint has not. This of itself would make up a large part of the difference between the estimates of this office and Mr. Preston.

"Again, it is the practice of the Department to decrease the gold estimates and raise the silver output. This practice is due to the fact that many of the miners fail to account for any silver production, but estimate the year's work on a gold basis. When, therefore, this gold is taken to the refinery the silver is extracted and added to that account. On the whole, therefore, I think my estimate of the gold produced in California in 1896 is substantially correct. I might say that it is the custom of the Department to decrease the gold output in every State. There was lopped from Colorado last year $3,000,000, and nearly half that amount from Montana. It is so of every State in the Union."

A New Source of Asphaltum.

The following discovery of deposits of asphaltum in the island of Barbadoes of the West Indies, from the London *Engineer*, will be of interest to those interested in asphaltum deposits in this country:

The discovery was made some months back of large quantities of a certain mineral—locally called "manjak"—which bids fair to outrival in point of utility all the similar substances that occur in various parts of the world. Manjak is of a black color, possessing high luster, and having a bright chonchoidal fracture, in appearance closely resembling newly-broken pitch. In Barbadoes it is found very near, and sometimes upon, the surface of the ground in seams varying from 1 foot to 2 feet in thickness, running usually at an angle of about 40° and in close proximity to rocks. It is supposed to have been formed by the drying up and consolidation of petroleum, which occurs in abundance in the same localities and is often seen oozing out of the ground or floating down the streams. In composition it is not unlike Trinidad pitch, the Utah gilsonite and the Canadian albertite, but is of superior quality to any of these. It is supposed to equal the Egyptian asphaltum in quality, but there is a doubt as to the correctness of this view. The analysis of the best quality manjak is: Moisture, 2.00; volatile organic matter, 70.85; non-volatile organic matter, 26.97; mineral matter, 0.18; total, 100.00. As ordinarily met with, however, it does not quite come up to this analysis. It contains rather more—about 5 per cent—moisture and mineral matter. Referring to the analysis of Trinidad pitch, we find that it contains between 21 per cent and 30 per cent moisture and about 38 per cent ash, so that the superior richness of manjak in natural bitumen, as compared with Trinidad pitch, is evident. Among the various uses to which manjak has been successfully applied may be mentioned: (1) As insulation for electric wires; (2) as varnishes of the best quality; (3) as bituminous concrete in asphalt roads and pavements; (4) as patent fuel, mixed with peat or other organic matter; (5) in small percentages, as an intensifier of the illuminating power of coal gas. Such satisfactory results have been obtained by its use for insulation that it is expected by some experts that it will soon supplant rubber in all waterproof work.

Increasing Mineral Yield of British Columbia.

Returns compiled by the Collector of the Port of Nelson, in British Columbia, for the present fiscal year ending June 30th show that the revenue has increased from $188,000 to $350,078, while the mineral exports have made a relative increase, amounting to $4,841,459. These figures do not cover the entire mineral exports of the district, as much of the ore went out via Revelstoke. Were all the mineral exports of southern Kootenay included, the aggregate would exceed $5,000,000. A comparison of the several quarters of the fiscal year just closed with the corresponding quarters of the previous year shows that for the last quarter of the fiscal year ending June 30, 1896, the value of the mineral exports was $467,667; for the corresponding quarter of the year just closed their value was $1,309,184.

The following table shows the relative values of the different metals for each quarter:

	Value.
Quarter ending September 30, 1896—	
Gold	$268,215
Silver (259,422 ounces)	355,824
Copper (1,118,407 pounds)	67,773
Lead (3,049,334 pounds)	38,723
Total value for quarter	$730,535
Quarter ending December 31, 1896—	Value.
Gold	$428,736
Silver (500,302 ounces)	324,211
Copper (1,354,919 pounds)	104,521
Lead (2,310,879 pounds)	28,332
Total value for quarter	$885,800
Quarter ending March 31, 1897—	Value.
Gold	$ 905,561
Silver (1,101,274 ounces)	718,396
Copper (2,054,754 pounds)	189,045
Lead (7,048,314 pounds)	103,038
Total value for quarter	$1,916,040
Quarter ending June 30, 1897—	Value.
Gold	$ 704,368
Silver (676,221 ounces)	369,212
Copper (1,518,817 pounds)	157,176
Lead (4,576,455 pounds)	78,328
Total value for quarter	$1,309,184
Summary of exports—	Value.
Gold exported during year	$2,306,880
Silver exported during year	1,767,643
Copper exported during year	518,515
Lead exported during year	248,421
Grand total for year	$4,841,459

THE Empire State express on the New York Central road, last week, broke all records by making the run from Syracuse to Buffalo, 148.8 miles, in 143 minutes, including a two-minute stop at Rochester and two slowdowns near Syracuse, aggregating four minutes. The actual running time was therefore 137 minutes.

A METHOD of precipitating zinc in aqueous solution in the shape of dense plates of commercial thickness by means of electricity has been found at the zinc works at Duisberg, in Germany.

Electrical Progress.

The Power Plant of the Pioneer Electric Power Company of Ogden, Utah.

In the canyon of the Ogden river, near Ogden, Utah, the latest and most important hydraulic power plant of that State, and one of the largest works of the kind yet undertaken in this country, has been carried out during the past year by the Pioneer Electric Power Company of Utah. Ogden is in the basin of the Great Salt Lake, 4300 feet above sea level, thirty-five miles north of Salt Lake City. It extends eastward to the base of the Wahsatch mountains, which are 5000 feet higher, reaching a total altitude of 9000 feet above the sea. This chain of mountains is intersected by numerous canyons, forming the outlet for drainage areas of considerable extent. The outlet of the canyon of the Ogden river is two miles east of Ogden. About six miles above its mouth the narrow gorge through which the river flows widens out into a valley, eight miles by four, surrounded by an almost continuous mountain chain. The valley is traversed by three streams, which unite at the upper end of the canyon to form the Ogden river, the drainage area of which is about 360 square miles. Its flow varies greatly. In May and June, when the snow on the mountains melts, a maximum flow of 4800 cubic feet per second has been measured, while a minimum of 80 cubic feet in August and September is also on record. The minimum in average years is probably 125 cubic feet per second. The slope of the stream in the upper valley is comparatively gradual, while in the six miles of the canyon there is a total fall of nearly 500 feet. This portion of the river has long appeared an attractive field for the development of power, but apart from a small sawmill near its mouth there have been few attempts made at utilizing the fall of the stream.

TRENCH IN OGDEN CANYON.

The plans of the Pioneer Electric Power Company contemplate the utilization of the waters of the entire Ogden river watershed above the mouth of the canyon for the development of power as well as for irrigation. The central features of the plant are: A large storage reservoir and a masonry dam at the upper end of the canyon; a pipe conduit 6 feet in diameter; a power house with water wheels and electric generators, electric transmission lines and sub-stations for distributing the power to different points, and an extended system of irrigation canals.

The storage reservoir will cover an area of about 2000 acres and will have a capacity of nearly 15,000,000,000 gallons. It will be formed by building across the canyon, a short distance below its upper end, a dam of concrete masonry, built up of isolated piers and arches founded on bedrock. The length of the dam on its crest will be about 400 feet. It will have a total height of 100 feet, 60 feet of which will be above the level of the present river bed. The upstream face is protected by a steel plate covering to prevent abrasion and percolation.

A 9-foot tunnel, excavated through the solid rock around the south abutment of the dam, forms the outlet for the water of the reservoir. At its upper end it connects to a masonry inlet tower, which is in turn connected by a rivetted steel iron pipe, 3 feet 6 inches in diameter, with the main gate house 100 feet below the tunnel. This contains two 72-inch valves, one containing the supply of the main conduit, the other discharging the surplus water. The main conduit is a pipe line 6 feet in internal diameter. Its total length is 31,600 feet, of which 27,000 feet is wooden stave pipe and 4600 feet at the lower end rivetted steel pipe. It is laid in a trench 8½ feet wide, and covered with earth to a depth of 3 feet on top. The pipe is laid along the side of the canyon and follows the mountains to a point about half a mile beyond the mouth of the canyon. It is built to conform to a hydraulic grade line of 2 feet per 1000—a slope believed to correspond to the friction in the pipe. At the upper end of the pipe the inlet is funnel-shaped, and the wooden pipe is continuous, except at three points, where two rivetted steel elbows and a short length of tunnel are substituted. There are eight tunnels in the rock, the longest being 667 feet. There are also eight steel bridges, with a total length of 560 feet, besides a timber trestle. The maximum hydrostatic head in the wooden pipe is 117 feet, giving a pressure of fifty pounds per square inch.

MAKING THE WOODEN PIPE.

From the end of the wooden pipe the steel conduit runs to the power house. The slope of this is steep; the pressure is from 50 to 200 pounds per square inch. It is 60 feet in diameter until it reaches a point 100 feet from the power house, where it divides into two branches, 54 inches in diameter, which lead to two receivers, one on each side of the power house. There are thirteen elbows in this pipe and its entire weight is over 2,500,000 pounds. The total efficient head from the flow line of the reservoir, which is full to the center of the receiver, is 446 feet.

The riveting of the pipe in the trench was effected by power riveters, operated by compressed air at a pressure of from 50 to 75 pounds. Five hundred rivets per day of ten hours were driven by each machine. At the steep grades of the steel pipe line it is anchored by means of concrete anchorages built around it, 8 feet by 10 feet in section and 10 feet long.

The wooden pipe is built up of Douglas fir staves, tongued and grooved, 32 inches in circumference, 16, 18 and 20-foot lengths, 2 inches thick. All the staves were planed and dressed in a special mill erected near the mouth of the canyon. The pipe was laid upon sills in the trench, and was banded with round steel rods ⅝ inch and ¾ inch in diameter, the latter being used where the pressure exceeds that due to a head of 100 feet. In order to bring the staves to the inaccessible parts of the canyon a cableway 1000 feet long, erected on framed towers, was built.

THE PIPE LINE ALONG THE SIDE OF THE CANYON.

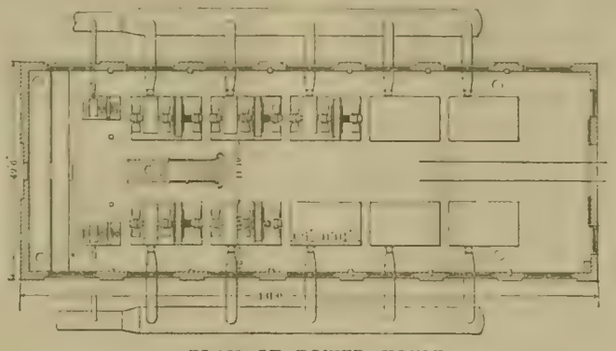
Between the inlet tower at the dam and the power house there are five large gate valves, besides the smaller blow-off and relief valves. Three are 6 feet in diameter, the other two 42 inches. The first two of the larger ones weigh about 23,000 pounds each, and are in the gate house; the third is placed near elbow No. 2 of the steel pipe line, about 100 feet below its junction with the wooden pipe. Its purpose is to permit the closing of the wooden pipe to keep it full of water even when the steel pipe is empty. The head at this point is about 200 feet. The valve has only a single valve stem and is operated by a hydraulic lift supplied with water pressure from the main pipe above the valve. The total weight of this valve is 52,000 pounds, the heaviest single piece in it weighing about 20,000 pounds. Besides

EXTERIOR OF POWER HOUSE, SHOWING ONE VENTURI METER AND RECEIVER.

these large valves there are two smaller, each 24 inches in diameter. These are placed between the lower end of the 6-foot pipe and the power house, in the 54-inch branches leading to the receivers. These branches are reduced to 42 inches by the use of Venturi motors, thus permitting the use of the smaller valves, which are operated by hand. The pipe is fully provided with air, mud and relief valves. The connection between the main pipe and the branches is made by a breeches casting secured to the steel pipes by cast steel angle flanges and belts. To withstand the great longitudinal pressure, a heavy concrete block is built around the casting. Of the nine bridges the longest is that over the Ogden river. This is a riveted bowstring girder 75 feet long. The other bridges carry the pipe line over lateral ravines or were built in place of masonry retaining walls, where a steel structure was cheaper. The power house is built of pressed brick, with concrete and rubble footings and cut stone trimmings. Its outside dimensions are 135 feet in length by 50 feet in width. The roof trusses are of steel, and are supported on steel posts imbedded in the brick walls. A traveling crane of fifteen tons capacity, operated by hand power, traverses the building, the track girders being carried by the steel posts. This building contains all the hydraulic and electric machinery used. A smaller, separate building serves as a machine and blacksmith shop. The water is delivered from the pipe conduit into two receivers, buried in the ground, one at either side of the power house. They are 6 feet in diameter, and, in their general appearance and the material used, closely resemble the regular steel pipe conduit, the thickness of the metal, however, being increased to $\frac{7}{8}$ inch in order to allow for the water hammer. The receivers are provided with five safety valves each, which discharge when the pressure exceeds 200 pounds per square inch, and an outlet gate at the bottom. From each of these receivers five 30-inch and one 10-inch intake pipes extend to the walls of the power house to connect with the water wheel nozzle pipes. Between these intakes and the nozzle pipes are placed the following valves in the order named: One 18-inch geared gate valve, one 18-inch hydraulic gate valve, and one 18-inch butterfly valve.

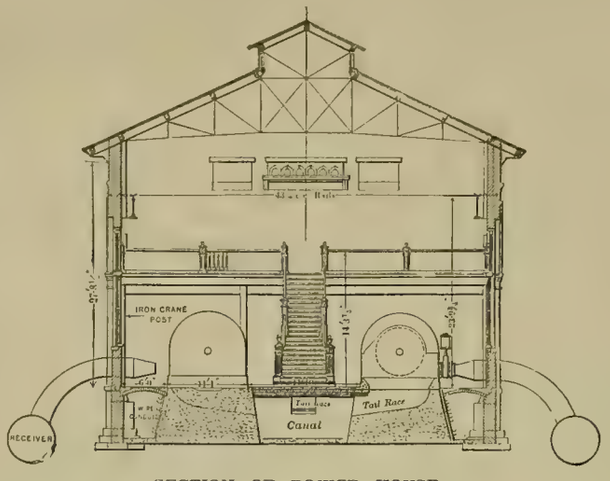
The 18-inch geared gate valve is only to be used in case of repairs to the particular machines that govern it. The 18-inch hydraulic gate valve is piped up to a small D valve, which is placed back of the switchboard and under the floor. By means of a lever on the switchboard, connected to this D valve, the gate can be opened or closed at the operator's will. This valve is the one which is to be used for starting or stopping a wheel. The 18-inch butterfly valve is operated by means of a worm gear from the governor, and is used in checking the speed of the wheel by reducing the head or pressure near the nozzle, and thus avoiding a sudden fall of head in the main pipe line, which would be detrimental to the proper working of the plant.

The nozzle for the water wheels has six rectangular openings, or ports, $1\text{-}\frac{11}{16}$ x$3\frac{1}{2}$ inches in area, of which the operator is able to close one or more, as he may desire. The levers that operate the hydraulic gate and nozzle are placed near the top of the switchboard. The set of levers for each water wheel is placed in the panel governing the generator, which is driven by the wheel in question, so that the operations required in starting or stopping these machines are reduced to a minimum. The wheels are of the impulse type, directly connected to the generators. The complete plant will consist of ten units, five being already installed. The power house and receivers being built for the ten, the balance can be readily installed at any time. The Knight water wheels are 59 inches in diameter and have forty-five bronze buckets cast in one solid piece; fourteen of these will, when the nozzle ports are all open, receive the water at the same instant. The centers of the wheels are made of cast steel, the buckets being pressed on these steel centers and secured with bolts. These wheels are keyed to the generator shaft. Each wheel has a capacity of 1200 H. P. at 300 revolutions per minute, and each is provided with two flywheels, about 70 inches in diameter, each weighing about two tons. The armature, armature shaft, two flywheels and one water wheel, which comprise the moving parts, weigh fifteen tons. This allows a uniform speed to be maintained, notwithstanding changes of head in the main pipe, or changes in the generator load. The water wheel, flywheels, nozzle and the two hydraulic cylinders controlling the nozzle ports are encased in a steel housing, bolted to the machine bed-frame. Between the two lines of machines and down through the center of the building, underneath the concrete floor, is the spillway, into which the wheels discharge the water and through which the water is carried back to the river from which it is taken. The generators used in this plant are of the General Electric Co. three-phase type, with 24 poles, and, at 300 revolutions per minute, have an output of 750 K. W. at 2300 volts and a frequency of 60 cycles per second. The factory tests show that the variation in volts will be less than 5% with a constant speed, should the full non-inductive load be thrown off or on.



PLAN OF POWER HOUSE.

Between the machine foundations and the building foundation wall, on each side of the building, is a subway which runs the entire length of the building and across the rear, and in this subway are carried all the necessary piping for water wheel controllers and all the wires between the generators and the switchboards. The cable connecting each generator to its respective panel on the generator switchboard is a three-wire concentric 250,000 C. M. lead-covered cables and the exciting wires are a two-wire concentric No. 4, B. & S. lead-covered cable. The exciters used on this plant are G. E. six-pole, 500 volt machines, and will give 100 K.W. at 550 revolutions per minute. Each of these machines is ample for the entire exciting current that will be needed for the ten 750 K. W. alternators, and they are each direct-connected to a 135 H. P. Knight water wheel, similar to the 1200 H. P. water wheels previously described. These exciter water wheels are cross-connected to each receiver, so that either exciter can be operated from either receiver. The generator switchboard consists of seven marble panels; five for the alternators, one for the exciter and one for the instrument panel.



SECTION OF POWER HOUSE.

There are two sets of three-phase bus-bars on the back extending the entire length of the seven panels, as well as two bus-bars, also running their entire length, from which the current is taken. From the generator switchboard the current is carried to the distributing board over copper bars, of which there are two sets of three, connecting the two sets of bus-bars on the generator board with the two sets of bus-bars on the primary panels of the distributing boards. The distributing board is in a gallery in the rear of the building and over the generator switchboard. Back of this distributing switchboard are nine 250 K. W. air blast step-up transformers, the lightning arresters and the two blowers for cooling the transformers. The distributing board is divided into two sections—the primary section and the secondary section. Each section has six panels. In the primary section four of the panels are for the low-tension side of the step-up transformers, the remaining two being for the local distributing lines in the vicinity of the power plant. In the secondary section four of the panels are for the high-pressure side of the step-up transformers and two for the long-distance transmission lines. Back of the distributing switchboard and on a raised platform are placed the step-up transformers. These transformers raise the potential of the current from 2300 to 16,100 volts, at which pressure it goes on to the long-distance transmission lines.

The transformers are connected up in sets of three, the delta connection being used on both sides. At each end of the building in the gallery are placed the two blowers, direct connected to a $2\frac{1}{2}$ H. P., 500-volt direct current motor. These blowers are used in cooling the step-up transformers and force the air up through the bottom of the transformers, around the coils and out at the top. The transmission line is calculated to deliver about 3000 H. P. at the substation in Salt Lake City, distant about thirty-eight miles, and consists of two circuits, making six wires of No. 1 B. & S. gauge.

The poles used on this line are of Oregon cedar—clear, straight poles 30, 40, 50 and 70 feet long, with 9-inch and 10-inch tops. There are two cross arms on each pole for the wires; two wires are on the top arm, 4 feet apart, and four wires on the bottom arm,

INTERIOR OF POWER HOUSE.

each 2 feet apart, a circuit being on each side of the pole. These wires are so arranged that should a plane be placed perpendicularly across the circuit it would show an equilateral triangle, with a wire at each angle, the length of the sides being 2 feet. These wires are transposed about every half mile. By this arrangement of the pole line wire the inductive effect is reduced to a minimum. About 6 feet below the second cross arm on the pole is a two-pin cross arm, on which the telephone wires are strung, being transposed about every four poles, there being an average of about fifty poles per mile. The current is fed into the transmission line at the power plant at 16,100 volts and delivered to the step-down transformers at 13,800 volts. This will give an energy loss of about 10 per cent in the line, and a potential loss of about 14 per cent. The sub-station step-down transformers deliver this current to the local distributing lines again at 2300 volts. There are at present nine 250 K. W. step-down transformers at the sub-station connected by the step-up transformers, and the switchboard in the sub-station is similar in every respect to the distributing board in the power plant gallery. The cooling apparatus here is also identical with that used in the power plant, except that the motors used are sixty cycle induction motors. While the transmission lines are at present capable of delivering 3000 H. P. at the sub-station, with a 10 per cent energy loss, if it should become necessary the step-up transformers can deliver more than this by changing three wires on their high-pressure side, and delivering the current into the transmission lines at 27,000 volts. Thus the line capacity would be more than doubled. The present installation of the power plant is capable of delivering 3750 K. W. to its lines, but ample provision has been made to increase this amount to 7500 by installing five more 750 K. W. machines, as new industries or manufactures spring up as the result of the advantages offered to them in Ogden and Salt Lake City. There is one important feature in the arrangement of the machinery which should be noticed, viz., the complete duplication of all parts. All portions of the plant below the breeches pipe casting, at the lower end of the 6-foot conduit, are absolutely symmetrical about the center line of the power house, each side being entirely independent of the other. This applies not only to the pipes and receivers, but to all the parts of the switchboards, etc., as well as to the generators and water wheels. Either of the exciters, also, is capable of providing sufficient current for all the large generators, and can be run with water from either receiver. The advantage of this arrangement is that an accident to either receiver, or to one or more wheels or generators, would not result in the shutting down of the entire plant, but, at the worst, of only one side. For a short period all the power required could probably be supplied from one side of the power house.

The current will be used to drive factories, running electric railways from Ogden to Salt Lake City, to the lake, to light the towns and cities in the north of the State. The surplus water in the storage reservoir will be used to irrigate large tracts of land in the vicinity.

The conception and successful completion of the works belonging to the Pioneer Electric Power Company are largely due to the efforts of C. K. Bannister, M. Am. Soc. C. E., who, as chief engineer and secretary of the company, has devoted several years to the careful study of the engineering and financial problems involved.

A LONDON daily, commenting on the warships at the great naval review at Spithead has the following comment on the United States warship Brooklyn: "The Brooklyn is capable of suggesting to us many things connected with the adoption of electricity to the work of a ship. In this matter we are at least five or six years behind several other countries, whereas America certainly leads the van. Some of the Brooklyn's electrical devices are perhaps a little too delicate, too complicated, or too unnecessary; but her gear for hoisting projectiles and ammunition to the guns and her machinery for working the turrets are so admirable that we recall with a blush of shame that only one of our British men-of-war is fitted with electrical shot hoists."

A Trolley Up the Jungfrau.

Up on the Jungfrau, an Alpine peak that only the most skillful mountain climbers could ascend, a railroad largely underground has been surveyed and will be completed this summer. The projector of the Jungfrau railroad is Herr Guyer-Zeller of Zurich. His proposition, when placed before the Swiss Government, provoked unbounded astonishment. But Guyer-Zeller explained that he meant to run his cars through a tunnel bored through the solid rocky heart of the mountain from the village of Scheidegg to the summit, and that the wild storms and perpetual snows of the upper levels could never interfere with its workings. Extensive surveys were made, and in the fall of 1894 the Government consented to the concession. Work was begun the following spring. The first station will be Eigergletscher, part way up the slope of Eiger and 2280 meters above sea level. Up to this point no special engineering difficulties will be met.

A strong curve will carry it to the left in a steep ascent up the cliff of Eiger, sometimes emerging to show the traveler a view of immense extent and majesty, and again plunging into the rock. Thus it winds up the snowless side until the station of Eiger is reached. This is about half way up the smallest peak of Jungfrau and 3221 meters above sea level. From this point the road runs in nearly a straight line toward the supreme summit, when opposite the second great peak Monch, the third station, is reached. This is 3623 meters above sea level. This station will be a general stopping place for climbers, and the Monch, with its 4105 meters of altitude, can be readily reached. From this point there is a gradual descent to the Guggigletscher Galerie, where, at a height of 3383 meters, the cars will pass along the top of one of the steepest walls of the mountain, a precipice of 1400 meters sheer descent. From there a tunnel carries the road on a sharp incline straight to the summit of Jungfrau, 4100 meters above sea level. The terminus of the road, the actual summit, is not yet reached. The real apex is a ledge of rock that shoots up 66 meters higher, but with a crown so narrow that the railroad cannot reach it. So the passenger will dismount and enter a tower, through whose interior an elevator quickly lifts him to the supreme point. The elevator will be worked by a dynamo, whose power comes from a hydraulic motor utilizing the waters of Lake Luchinen in the Lauterbrunnen. Within the tube is a winding staircase, so that travelers not caring to use the elevator may reach the summit afoot. All the tunnels and stations are to be lighted by electricity and connected with the world below by telephone and telegraph.

CABLEGRAMS announce that the French customs officers had been making successful experiments with Roentgen rays for the examination of trunks and the discovery of contraband articles. Cigars in a closed box are easily counted, it is said; the springs of an armchair plainly seen, as well as the contents of a carefully sealed package. Owing to the weight of the new instrument it cannot yet be used at small stations, or by the octroi offiers at the gates of Paris, but experiments have been made at the Gare du Nord.

THE kinetoscope took 143,000 different pictures during the Corbett-Fitzsimmons fight. The length of the film upon which the pictures were taken is two and a half miles.

Scientific Progress.

Liquid Air in Electrical Works.

It has recently been found that liquid air is one of the most perfect insulators, and that most insulating materials cooled to the temperature of liquid air are greatly improved in insulating qualities. It is known, also, that cooling renders it more difficult to cause a spark to occur between oppositely electrified conductors, the striking distance for a given pressure being diminished.

The stability or permanence of liquid air in bulk, even when it is fully open to the ordinary atmosphere or kept at atmospheric pressure, is of course simply dependent upon the heat insulation provided, and if this could be made perfect the air would never evaporate. But it may be possible that a much higher voltage than is now used (10,000 to 20,000 volts) may be successfully used with conductors cooled and insulated by liquid air. If the potential could be raised 50,000 volts, either the loss on the conductors for a given power transmitted would fall off as the inverse square of the voltage, or the conductors could be made smaller in the same proportion, or the distance of transmission increased with the same section of conductors as the square of the potential. These are matters worthy of experimental determination.

Could the conductors be kept cool by liquid air and thereby their conductivity and insulation greatly increased, the work of transfer in a reformer could be much greater for a given size than it now is, or the loss could be even less than it now is, although but 3 per cent is sacrificed in ordinary practice.

Transformers in liquid air might be made entirely of copper without iron, and their light load efficiency become nearly equal to full load efficiency.

A transformer without iron would avoid the loss in the air, and would permit such a saving in material that changes in design or disposition of the copper could be made to suit the condition of absence of the iron.

We need not touch upon the possibilities of liquid air as a means of energy storage, for they are self-evident enough, since liquid air is virtually compressed air which remains compressed, as it were, even when exposed to atmospheric pressure; that is, addition of heat gives to it pressure and the ability to do work in suitable engines in the usual compressed air motors. Our object has been to briefly point out what may be termed possibilities in electric engineering, assuming that data favorable to the ideas presented be the outcome of experimentation.—Elihu Thompson in Modern Machinery.

Interdependency of Inventions.

The advent of important and valuable inventions is often dependent, not upon the brilliant inspiration of some individual inventor, but upon the general and gradual advance of the state of the art to which they belong, making their occurrence not only possible, but almost inevitable. The bicycle is an excellent example of this kind of growth in mechanical construction, since, while it is one of the most important things both mechanically and commercially which has ever been produced, it owes its development to the parallel improvement in metal and rubber working without which it could never have existed at all, in the modern sense, or to any extent. The clumsy wooden velocipede would always have remained a useless toy had not the introduction of drawn steel tubing made the construction of a light and yet strong frame possible, while the original leather tire of Dunlop could never have led to the practical application of the pneumatic principle without the substitution of the rubber construction which only the advances in rubber manufacture made possible. This is but one instance of what is apparent in many other lines of work, and there is little doubt that if the patent records of the past fifty years were thoroughly studied by competent specialists many inventions, which at the time of their conception were failures simply because of the impossibility of executing the ideas, would now be found both practicable and valuable.—Cassier's Magazine.

Telegraphing Through Hills.

Tesla's utterances about wireless telegraphy recall the fact that an Italian some time ago claimed its invention and application in numerous experiments. His name is Guglielmo (William) Marconi. He even succeeded in transmitting signals through a hill. These first experiments remained the secret of the family circle till he went to London last year with his mother, who is an Englishwoman. There he soon attracted the attention of the director of the telegraphic service in England, who gave a lecture, which Marconi illustrated with his experiments. Private and public experiments soon followed. Some were given in the ministry of war and others in the general postoffice, in the presence of high authorities. The experiments were made with the primitive apparatus made in Italy, and yet, even then, telegrams were sent to very great distances in all directions and also through a little hill. Since then Marconi has been enabled to improve his original apparatus and hopes soon to send telegrams through hills and rivers by his new method of telegraphing.

A NEW USE of aluminum has been discovered in the manufacture of reproducers for talking machines. The reproducer is the apparatus which holds the vibrating diaphragm of glass. Heretofore the recorders and reproducers of talking machines have been made, as a rule, of hard rubber. For hard rubber aluminum has been substituted with what is regarded as much success. It is claimed that the blasting, blaring, or "chattering" as it is called in the trade, which is often noticeable in the performance of the talking machine, is almost completely absent when an aluminum reproducer is used.

COMMISSIONER OF PATENTS BUTTERWORTH says the business of the patent office for the current calendar year will be an increase of 7 per cent over last year, and that the receipts will be over $100,000 more. In view of this encouraging showing and of the inadequacy of the force of the office, he has asked Congress to insert in the urgent deficiency bill an appropriation of 40 per cent of the increase of additional appointments. Over $4,500,000 is now in the Treasury to the credit of the patent office, and this fact and the crippled service have been pointed out to Congress.

WHEN the flashlight of a submarine camera was burned recently in the Mediterranean, crowds of fish, with their wide-staring eyes, were instantly pictured on the sensitive plate. Photographs of submarine forests are startlingly novel. Seaweed makes an altogether different appearance when seen in its natural element from that which it presents when seen floating on the surface or driven up on the beach.

THE lightest balloon that has ever been built for continual use weighs a little over sixty pounds complete. Of this nine pounds is the weight of the netting, and seven that of the basket. This balloon is built to hold 4000 feet of hydrogen gas on the estimate that 1000 feet of gas will lift sixty pounds, although theoretically it will lift seventy pounds.

THERE is no reliable case on record where resuscitation has taken place after the complete freezing of the body in man. This has been frequently accomplished in the cold-blooded animals, such as fish and reptiles, if thawing be gradually brought about.

Mechanical Progress.

To Restore Smoothbore Cannon.

Colonel William H. Bell of the regular army has invented a projectile which promises to restore to usefulness $3,000,000 worth of old smoothbore cannon of rebellion times, which are lying loose around the United States. The old round shot which used to be fired from the smoothbores was never effective, as there was great loss of power by the escape of gases around the edges of the ball, and after it left the cannon the wind banked up against its sides and swerved it from its mark. Conical projectiles were given a rapid twist in their flight by being fired from the rifled gun, but the operation was expensive. Such are the great weapons of to-day, which have the fault that the balls are apt to tumble. Colonel Bell's invention, it is claimed, secures the necessary rotary twist in the air without the necessity of being fired from a rifled gun, and his projectile has not the fault of tumbling. In shape it is an ordinary conical shot. In its bore is a hollow capable of holding a considerable quantity of slow-burning powder. A plug screws into this hollow, holding the powder securely within. Around the edges of this plug are a series of grooves leading into the powder chamber, and bored at an angle opposite the direction in which the projectile is expected to twist, and thus bores its way through the air, which it does on the same principle that makes the Fourth of July pinwheel revolve when it is lighted.

A charge of quick-burning powder is dropped into the smoothbore cannon, and the projectile is pushed in upon it. The fuse is attached and the cannon fired. The quick-burning powder expels the projectile and lights the slow-burning powder through the grooves. This begins to act at once, accelerating the speed and initiating the twist even before leaving the cannon. The speed is said to actually increase while the projectile is in the air, and until the powder is burned out the rotary motion continues to accelerate the ball. Colonel Bell is stationed at the Presidio at San Francisco, and it is there that he made his first experiment a little over a year ago. Other tests are expected to take place shortly, and if results are found to be uniformly satisfactory the War Department will be asked to take official notice of the invention, and make tests with a view to adopting the projectile for use by the artillery of the regular army.

A Giant Umbrella.

The Department of Concessions of the Omaha Transmississippi Exposition of 1898 has received an application for space for the erection of a mechanical device. It resembles the framework of a gigantic umbrella. The part corresponding to the stick of the umbrella is an immense cylinder, 30 feet in diameter, constructed of steel plates, firmly riveted, making a "standpipe" which rears its head 250 feet above the level of the ground. At the extreme top of this cylinder are fastened twelve long arms resembling the ribs of an umbrella. These are steel trusses, reaching almost to the ground. At the lower end of each of these ribs is suspended a car for carrying passengers, each car having a capacity for twenty persons.

These monster ribs are raised by hydraulic power, acting by means of steel cables operating through the cylinder, aided by a mechanism greatly resembling that portion of an umbrella which comes into action when the umbrella is opened. By means of this mechanism the gigantic arms are raised until they are horizontal, the cars in the meantime being carried outwards and upwards until they reach a point 250 feet above the ground, the diameter of the huge circle formed by the suspended cars being also 250 feet. When the highest point has been reached another mechanism comes into play, and the suspended cars are swung slowly around in a circle, after which they are lowered to the ground. The sides of the cars are of glass, so that the passengers may secure an extensive view of the surrounding country.

Down Drafts.

In a paper read before the St. Louis association No. 2 of the National Association of Steam Engineers, Mr. A. B. Hazard makes strong claims for the advantages of down draft, in the application of which the green coal is placed upon the top of the fire and the air is forced downward through the grate. He claims that in this system there is (*a*) complete combustion of gas; (*b*) a complete combustion of the fuel; (*c*) no deposit of soot or tar; (*d*) a positive and rapid circulation of water in the water tube grates, which, with down draft, are in the hottest part of the fire; (*e*) no cooling of the hot furnace and boiler by throwing open the doors of the combustion chambers, as in the up draft systems; (*f*) much greater durability of grates; (*g*) increase of steaming capacity over that of boilers of the same size fired in the ordinary way; and (*h*) perfect smoke consumption. Of course, if these claims are sustained in practice, the logical result—increased efficiency—must inevitably follow. This is claimed to be from "10 to 50 per cent, depending on the kind of boiler and upon other conditions."

New Things in Paper.

Woven paper is a new article invented by W. A. Maurain, a Providence, R. I., manufacturer, which is designed as an improved kind of lining for carpets. A novel description of loom is employed in its production, and into this loom strips of paper a yard long are fed automatically through a tubular guide, which folds them lengthwise. These strips form a firm yet elastic weft a quarter of an inch thick and securely bound by warp threads.

A new kind of paper is being made of the fiber of sugar cane in the mill of Cunningham & Miller at Sugarland, Texas. The paper turned out is first-class hardware paper, and Col. Cunningham says that anything from butchers' stock to fine writing papers can be made at his mill. About fifty men are employed in the new enterprise, and the megasse, which heretofore has been a nuisance to the sugar planters and used for fuel, will be made to be a source of profit.

Speed of Modern Warships.

By far the larger proportion of the first-class cruisers, armored or protected, which in recent years have been projected or completed, are ships with speeds varying from 19 to 21 knots; and of those which equal or exceed 22 knots—projected, building or afloat—there is now a moderate fleet, among the leaders of which are the British Powerful and Terrible, armored cruisers, 14,250 tons, 25,000 H. P., 22 knots; the French Jeanne d'Arc, armored cruiser, 11,000 tons, 28,500 H. P., 23 knots; a protected armored cruiser for Italy of 10,500 tons, 13,000 H. P., 23 knots; the Buenos Ayres of Argentina, protected cruiser, 4500 tons, 14,000 H. P., 23.2 knots; the Chilean Blanco Encalada, protected cruiser, 4420 tons, 14,500 H. P., 22.78 knots; the Neuve de Julio, Argentina, protected cruiser, 14,500 H. P., 22.74 knots; and the Yoshino of Japan, an improved form of the latter vessel, with a speed of 23.08 knots. It would seem that expert opinion favors extreme speed for large cruisers.

FROM statistics compiled by the *Railway Age* it appears that during the first six months of 1897 only 622 miles of new track were laid upon fifty-five lines in twenty-three of the forty-nine States and Territories. This is 166 miles less than in the corresponding half of 1896, 10 miles less than in that of 1895, and about 100 miles more than in the first half of 1894. The number of States in which track has gone down is less than in any previous year for two decades, and the number of lines is also less than in any of those years except 1894. In twenty-six of the States and Territories no new railroad construction has been done thus far this year. A number of these, however, will no doubt appear in the record for the entire year. Construction is in progress on many lines upon which track laying has not yet begun, and if the financial situation continues to improve it is possible that 1897 may show more track laid than any of the three preceding years. It is estimated that the new construction of the year will aggregate from 1800 to 2000 miles.

IN a report made to the State Department by Mr. Monaghan, Consul at Chemnitz, Germany, a description is given of a new plan for a cheap and durable roof invented by M. Kohler of Limbach, Saxony. It consists simply of cement and gravel, or cement and sand, being thus as durable as slate, with the advantages of being very much cheaper, looks as well or better, and can be made much easier and put on quicker. The weight of a square yard of these tiles is calculated at sixty pounds, but they may be made heavier or lighter, as desired. Certain ridges are formed around the inside of the plate and permit of one so lying on and in the ridges of another as to preclude the possibility of wind or water working their way inside.

A CHICAGO company is working on a new horseless carriage. Mr. Overman considers that others who have studied the matter have made a mistake in following the models of vehicles built for horses. He began on the supposition that no horses had been used, and banished all idea of shafts or dashboards.

FOR SALE.

The Following Machinery, Nearly New. Now Located in State Agricultural Exposition Building at Sacramento:

One 16x42 R. H. Poppet-Valve O'Neil Automatic Cut-Off, 100-Horse Power Horizontal Engine, built by the Union Iron Works, with Band Pulley, 22 in. x 12 in. Pipe Connections and Valves complete, as it now stands.
One 22 in. Double Leather Driving Belt.
One 18 in. Union Exhaust Steam Feed Water Heater.
One Buffalo Duplex Boiler Feed Pump 6x4x6.
Two Tubular Steam Boilers, 54 in. diameter, 16 ft. long, in good order, with Furnaces, Grate Bars and Settings complete; one Injector for each Boiler, and all the necessary Checks, Valves and Gauges.
One Stack, 48 in. diameter by 80 ft. long.

For price and particulars, address
EDWIN F. SMITH, Secretary, Sacramento.

FOR SALE CHEAP.

First-Class Air Compressor (Steam Driven) and Drill, New.
Also, 3-Ton Capacity Pulverizer.
A. L. FISH, 59-61 FIRST STREET, S. F.

FOR SALE CHEAP.

Gold Wet Washing Machine,
MAIT'S MAKE.
Capacity, 8 Tons Per Day.
Good order. Can be carried anywhere by prospector.
Address T. L., this office.

WANTED.

Able, rugged man, as Roaster, thoroughly familiar with oxidizing dead roast of gold concentrates in Bruckner furnace. None other need apply. Address quickly, stating experience and qualifications.
JACKSON & LAKEVIEW MINING CO.,
LUNDY, CAL.

WANTED. — A Second-Hand 5 OR 10 STAMP MILL.

Address, stating particulars, price, etc., A. B., this office.

YOUNG MAN with knowledge of metallurgical chemistry, assaying, cyanide process, etc.; thoroughly competent silver plater, is looking for position. Willing to make himself generally useful. First-class references. Address C. D., Mining and Scientific Press Office.

WEST COAST OF MEXICO.

WÖHLER, BARTNING & CO., Mazatlan (Sinaloa), Mex.
Bankers, Importers, Exporters and Commission Merchants.
Representatives and Agents of the principal Mining Companies in the State of Sinaloa and the dependencies of the Pacific coast in the States of Durango, Chihuahua, Sonora, Lower California and Jalisco.
ORE BUYERS AND EXPORTERS. - MINING SUPPLIES.

MODERN METHODS as applied to the handling of Freight, Grain, Ores, Raw and Manufactured Products.
MALLEABLE IRON BUCKETS, Approved Pattern and Weight; ROPE POWER TRANSMISSIONS, SHAFTING, PULLEYS, GEARING, CLUTCHES, ETC.; ELECTRIC COAL MINING MACHINERY.
SEND FOR CATALOGUE NO. 20.

HEADQUARTERS.
Genuine English Pump Leather
For Heavy Mining Pump Buckets. Will outwear any other material and give best satisfaction. Samples furnished on application. A. C. NICHOLS & CO., Leather Manufacturers and Dealers, 404 Battery St., S. F.

Mining Summary.

CALIFORNIA.

Amador.

Dispatch: After a long time the Zeila mine is again in operation with nearly a full complement of men. The mill started up also, and will be kept at work day and night from now on.

At the Oneida the shaft is now down 1060 feet and sinking is progressing steadily.

At the Amador Queen No. 1 sinking is progressing, about 48 feet having been obtained since last report. The crosscut to the east is now about 50 feet from the shaft and the face of the drift is in hard rock.

At the Valparaiso sinking is being prosecuted, the rich ore shoot still holding as they go down on the ledge. An expert visited this mine this week in the interest of a Chicago company.

The flow of water in the Alma still continues, but the management is able to handle it as yet. They will put in machinery to handle the water and admit of work at the same time. It is intended to use the diamond drill again shortly.

On the Kennedy the new machinery at the north shaft is nearly all in place.

The cleanup at the Zeila mill of the last run from the Argonaut mine proved more satisfactory than any heretofore. Work on the new 40-stamp mill is progressing favorably.

Butte.

Register: The Rock River mine, near Oregon City, is running night and day with a force of about a dozen men to a shift.

In Cherokee the Coster Company is working twelve or thirteen men. Another Portuguese company will commence operations this week with about the same number of men.

Calaveras.

Prospect: The 700-foot mark in the shaft of the Thorpe mine at Fourth Crossing has been reached and another level is being run to tap the ledge.

In a short time operations will be commenced on the river between the Davis ranch and La Grange by a company to dredge the river bed and secure the gold that is lodged on the hardpan that forms the bed of the river. Ten or twelve miles of river have been bonded.

Fred Greve of Blue Mountain bonded last week to Oakland and San Francisco parties the Eureka, Neutral and Oro Fino or Black Wonder quartz mining claims, all in Blue Mountain mining district, for a term of two years for $19,000.

Citizen: The Table Rock mine, owned by Cunningham, Fisher & Defoor, has commenced work again.

The Plucky Tom mine is shut down at present.

The Page-Cutting mine is proving a success.

On the Fricot tunnel on the Albany mine the present contract is nearly completed. The tunnel will tap the Columbus lead at about 400 feet.

Work upon the Cow Bell mine, owned by Ehrhart & Worcester, has been temporarily suspended.

The Grace Darling mine, E. Moores superintendent, continues as for the past twenty-five years to turn out good rock.

The Coralie mine, H. W. H. Penniman owner, is temporarily shut down, awaiting supplies and timber.

Mariposa.

(Special Correspondence).—The mill of the Merced Co. is running steadily on ore from the Mary Harrison, and monthly shipments of satisfactory size are going forward. All the men who can be worked to advantage are being put into the stopes, and no attempt is being made to keep the development work in the mine even abreast of the ore extraction. The haste is said to be due to the desire to make as good a showing as possible before the failing water supply causes a suspension of milling for the season. A great many miners from Michigan are coming into camp and find immediate work on the Merced properties. One of the company's hoisting engines is being run by a boy of eighteen, probably the youngest engineer in the State. At the Virginia crosscutting and drifting continue at three points in the old incline shaft.

Mark Parker and Austin Shimer have bonded their two claims on the east lode to Dan'l O'Toole for $7000, and the first payment has been made. Mr. O'Toole is part owner of the Virginia, adjoining these claims, and is supposed to have taken the bond in the interest of the California Exploration Co., who are working the latter mine.

The Plain View has suspended operations indefinitely.

The new mill on the Louisiana will be ready to start in a few days.

Work on the Contention at Bull creek is virtually suspended. This is the property extensively written up lately by the San Francisco dailies as having large bodies of black slates assaying $600 per ton.

The Garibaldi Mining Co. has been formed to work the Blue Lead mine, and incorporated with a capital stock of $1,000,000. The difficulty over the title to the property has been adjusted and the purchase price, which was in the neighborhood of $5000, has been paid. An effort to open the property will now be made. Attempts by the former owners to work the mine some years ago were unsuccessful, by reason of the large bodies of water encountered, and the mine was flooded and abandoned. It is believed that with better pumps the flow can be controlled.

In the Bondurant tunnel the new compressor has raised the rate of progress to 25 to 30 feet a week. It is thought the vein will be cut in a few days.

Bert McFadden, Robert Barnett and others have located the old French mine, near the northeast corner of the Mariposa grant. This property has always been claimed as a part of the grant, but is now asserted to be just outside the limits.

The Spencer mine near Whitlock is sold and a strike of considerable importance is reported from the same property.

The heavy bullion shipments from the Tendron continue.

The bullion shipments of Mariposa county for the past three months have exceeded those of the entire year of 1896.

Coulterville, July 20th, '97.

Nevada.

(Special Correspondence).—The litigation on the Gold Bar mine, one-half mile from town, has been settled, and preparations are being made for reopening the property. It has a shaft 200 feet deep, and years ago, before trouble came upon the place, good ore was taken from the mine. It is owned by W. H. Weldon and others.

The Bodie, five miles west of town, owned by local capital, associated with F. W. Page and Geo. H. Nihell, is being developed. The shaft is 60 feet with a drift 40 feet on the ledge, which is 3 feet. Assays of ore from the hanging wall run $52.53 and from the footwall $132.48. The sulphurets run 3%.

At the Brunswick Consolidated the shaft has reached 900 feet. Drifts have been opened east and west on the 900 level, reaching 375 feet from the face, showing a vein of 20 inches the entire distance. The vein in the west drift is 3 feet. A new plant of 10, 12 and 14-inch plunger pump is being placed. At present ten stamps are running night and day, and ere long twenty will be dropping. The property is owned by a New York company. C. H. Mallon of Nevada City is superintendent. The mine is one and one-half miles from Grass Valley and 1500 feet from the old Idaho property. J. F. L.

Grass Valley, July 19, '97.

(Special Correspondence).—The owners of the Home mine have purchased the Texas and Minerva properties and have begun development work. D. J. McFaull, superintendent of the Home, has charge of the new work also.

At You Bet the Red Dog Gravel Mining Company are doing extensive development work. The shaft has reached 200 feet, from which a drift of 200 feet is run in bedrock under the channel. The company expect to strike the channel within 200 feet by an upraise of 40 feet.

At the Providence mine a 300-foot drift has been run at a depth of 1780 feet. Superintendent McKinley is cutting a chamber at the end of the drift, where an engine will be placed and a shaft started. The power drills will be run by compressed air.

Whilst Grass Valley and Nevada City are two prosperous mining towns, labor is abundantly available at home, and it is not advisable for persons to come from the outside to seek employment in the mines.

Over in the Washington district a rich find has been made by Patrick Dillon on Poorman's creek, about a mile southwest of the Spanish mine. He has a tunnel in 120 feet on the ledge, and has just made a crosscut. The main ledge itself is 23 feet wide, and the whole formation between the walls is from 35 to 40 feet wide. J. F. L.

Nevada City, July 17, '97.

Herald: In the Bellefontaine mine at Willow valley in sinking the shaft 40 or 50 feet the ledge widened 13 inches, and there is now a 2-foot ledge. The crew take out about three tons per day of high-grade ore just in sinking the shaft. The hoisting works will be finished next week, when crosscutting in the mine will begin.

Hon. J. H. Neff of Colfax and Hon. Edward Coleman of San Francisco have been looking at the Stanford mine, near Indian Flat, and they will probably take it. They are organizing a company for mining development, and W. W. Montague, the new postmaster of San Francisco, will be a member of it.

Telegraph: The Gold Bar and O K mines are to be opened by a company composed of Judge Schell, President; S. K. Thornton, George F. Davidson, Jabez Howes and Daniel O'Connell, all of San Francisco. Henry Phillips, formerly of the Kentuck mine, will be manager.

Union: The owners of the Texas mine at Willow Valley will commence to sink a three-compartment shaft preparatory to developing the property on a big scale. The new owners of the Texas are the same men who own the Home and Cadmus mines.

Placer.

Record-Union: The Bartley Consolidated drift mine is three-fourths of a mile east of Dutch Flat. The company own 110 acres on the course of the channel. A tunnel was commenced last September and has been extended 900 feet. Two crosscuts have been run, one north across the channel 310 feet and one northeast 140 feet, and still another 125 feet. The tunnel has not reached bedrock yet, but will as it is completed up stream. Developments prove that the channel is 1000 feet in width. The material extracted while running the tunnels and crosscuts, without breasting out, has paid two-thirds of the work of development. The gravel when worked will be from 6 to 20 feet in height.

The Alta Gold Mining Company's claim runs under and beyond the town of Alta. It includes one mile of surface ground. When the present owners got possession they started a tunnel from Canyon creek and have extended it over 4000 feet. Two distinct white gravel channels have been crossed, and now the tunnel has penetrated a blue gravel channel which is considerably deeper. The work so far done is only exploratory.

On the Truro mine the owners commenced work a year ago. They only had to run a tunnel 315 feet before striking the channel. They have already crossed 100 feet, and there are no signs of the opposite rim yet. The gravel will be worked 5 feet high.

Ex-Governor Willey of Idaho is superintending the Redstone quartz mine for a Philadelphia company. The mine is about one and a half miles southeast of Blue canyon. There is a mill having ten stamps and concentrators, all run by water power. The ledge varies from 3 to 15 feet in width. It is encased with porphyry and slate. The ore is low grade, but it can be worked for $1.25 per ton.

Sierra.

Mountain Messenger: At the Gold Bluff mine four men are now at work as tributers.

The season's run at the Excelsior is about over.

A number of Chicago mining men are in Downieville. They are interested in the Sierra Gold Company.

Siskiyou.

News: The Klamath Flume and Mining Company started their sawmill last Saturday and will run it night and day on lumber for the flume. There will be nearly eighteen miles of flume put up. They will probably have at least 150 employed as soon as there is room for them. The company have good water rights and their flume will cover all the ground they own. It is expected they will be washing dirt in about eight months.

The Minetti B. mine at Nolton has suspended work until their suspension bridge is completed and a hoisting plant is put in.

Journal: The Bennett mines on Salmon river are reported to be doing splendidly this year. Mr. Bennett recently took a large amount of dust to the mint.

All of the river claims along the Klamath are busy at present hoisting gravel and accomplishing all they can before the fall storms drive them out. A number of these mines are run by Chinamen, and in nearly every instance they make it pay, as they usually form a company and do their own work, whereby all share in the profit. Mines that white men cannot work are sometimes paying properties when they come into the hands of Chinamen.

Tuolumne.

Union-Democrat: C. G. Bacon has purchased a one-half interest in the St. Helena group, and a tunnel has been driven in 64 feet, crosscutting at face showing 23 feet of well-defined quartz.

On the Golden Gate the main shaft has attained a depth of 700 feet, at which point sinking was discontinued. The ore reduced comes from the 300 and 400 levels, the latter being the bottom one, none having been run between that station and the 700.

Crandall and Dull have secured control of the Golconda group of mines and will shortly begin operations on a large scale.

The Rawhide continues to daily work up 100 tons of good ore from the stopes between the 1000 and 800, and the main shaft is being pushed on toward the 1200 level.

In the Consuela, of the East belt, that has recently been reopened, drifting and crosscutting are being done. The ledge is big, and a strike of rich ore is reported.

Gus Ogden has bonded the Providence mine to San Francisco people. The new company propose to operate the property on an extensive scale, and have retained Mr. Ogden as superintendent.

Independent: At the Arbona the new 10-stamp mill has been started up.

On the Dutch mine the new twenty stamps were started up last week.

At the Whiskey Hill group improvements have recently been made. On the surface twenty-five men are kept busy. The main shaft is now down 50 feet. The frame for the perpendicular hoist is completed, and in a few days more two cages will have been put in.

In Woods creek, in Jamestown, Burns and Haley are washing the gravel with good pay results.

At the Shawmut mine, near Jacksonville, the ten stamps recently put in operation are dropping on a high quality of pay ore.

The old abandoned Green mine, in the vicinity of Confidence, is being reopened.

At the Tarantula mine the tunnel is now in 225 feet. At a depth of 150 feet crosscutting is going on. The character of ore taken out is encouraging.

NEVADA.

Silver State: Since the 22d of February of the present year the Dexter Mining Company at Tuscarora, according to the directors' report, have produced gold bullion of the value of $35,896.76, cyanides of the value of $13,142.27, and tailings that netted the company $3096.65.

Lyon County Times: Machinery is piling up at the copper smelting plant in Mason valley. The boiler is set and work is progressing on all parts of the plant as rapidly as possible.

At the Logan & Hully mine the mill will be furnished with a concentrating plant. This method will take out the objectionable features in the ore for cyanide working, and the tailings, which will be caught, will probably be worked by the cyanide process. The new lower tunnel has reached the ledge, which is 20 feet wide. The development work so far done shows 100,000 tons of ore in sight.

WASHINGTON.

Spokesman-Review: At Marcus the Little Giant is now a shipper. It has been under development for more than a year, and over 500 feet of work was completed before the first shipment went to the smelter. The mine now has a producing capacity of 10 tons of shipping ore per day.

At Boundary Florman & Hays have sold the White Cap group of mines on Red Top mountain to Mason & Palmer of Bangor, Maine, for $20,000. The group is a fairly well developed proposition and susceptible of being a shipping mine at an early date. The purchasers propose to commence work at once.

At Bossburg Gerg & Parkin have arrived with a large plant of gold saving machinery, which they will place upon the Coxey bar, on the reservation side of the Columbia river. The bar contains in the neighborhood of 1000 acres of low bench land. The plant, when in full operation, will employ in the neighborhood of fifty men. The Paris, across the river from Bossburg, is being worked by a full force of men. The Young American will resume work soon, and the Bonanza will begin making regular shipments about the first of August.

BRITISH COLUMBIA.

(Special Correspondence).—The Smuggler Mining Company have leased the Strathyre mill and are putting in new engines and boiler. When the lease expires at the end of the year they are going to put in a 15-stamp mill.

There is a new mill going up on the Winchester.

The Joe Dandy has received a carload of hoisting machinery for its three shafts.

The Stemwinder, the pioneer mine in camp, has passed into the hands of Doer & Davidson of Victoria, who will put up a mill. It is a large body of free-milling quartz.

Capt. Duncan of the Montreal and British Columbia Development Company, was in camp this week buying properties. At present he owns the Fern group at Nelson, on which a 20-stamp mill is being put up.

The Quintette is shipping 75 sacks a day to Tacoma. They are sinking a 50-foot shaft, besides running crosscuts. A one-half interest in this was sold for $65,000 to L. Fender and partners of Portland by Dr. Langhammer.

The Tin Horn mill, 20 stamps, is nearing completion. They have four claims, 1500x1500, on this lead, and it can be traced the whole distance. At present about 25 miners are employed at the mine running four tunnels and sinking a winze.

Ore has been struck in the Oro Fino, a new prospect.

In the Gladstone the ore runs well in free gold, but it is characteristic of this belt that most of the gold lays in galena.

Fairview, July 14, '97.

(Special Correspondence). — At Cayoosh creek, Lillooet, the contractors for the Golden Cache mill have promised to be ready for crushing on August 1st. In No. 4 tunnel, the last driven in the mine, rich free milling ore, that made the mine first known, has been struck.

On the Alpha Bell property, which contains the same vein as the Golden Cache, a tunnel is being driven in. At 7 feet the Golden Cache free milling ore was struck, thus proving the Golden Cache and the Alpha Bell property also.

The Money Spinner mine, owned by the Fire Mountain Company, Harrison lake, New Westminster district, has a tunnel in on their vein. It is 30 feet long. The walls are well defined, and gouges run along both sides between the vein and the walls.

The Athabasca mine, Nelson district, has uncovered another lead on the property. The Athabasca Company have made their first shipment to the smelter.

Vancouver, July 19, '97.

Spokesman-Review: At Grand Forks Schuller and Willett, who are interested in the Eighteen Karat group of placer claims, while putting in a 500-foot flume to work fine gold, discovered coarse gold lying in the black sand and on the water's edge.

ALASKA.

(Special Correspondence). — All the big stories sent from Alaska about the gold finds are upheld by actual occurrences. The Klondyke placers are the richest since the early days of California. I doubt if anything richer was ever found than the claims that have lately yielded so much gold in Dawson, Bonanza and Hunker districts in the Klondyke region. Nearly a year ago reports came from the dreary tundras of the upper Yukon that extraordinarily rich placers had been found, but the news was generally believed to be greatly exaggerated. It is now evident that less than the truth was stated. The steamer Portland came in yesterday from St. Michaels with about eighty people, most of whom were miners from Alaska. The boat had on board gold dust and gold nuggets worth considerably over $1,500,000, all of which came from the Klondyke section, and most of it was taken out of the ground in the last four months. One of the party—Clarence Berry, a Californian—had about $125,000 which he got from his claim in about ten weeks. Others had amounts from $5000 to $75,000 each. The arrival of the miners and so much gold has occasioned great excitement here and a good many are preparing to go to the new El Dorado. Two steamers will shortly leave here for Dawson—one this week and another next week—and already every bit of room is engaged. The returning miners warn all that they are taking big chances, that they should have plenty of money, abundance of food, good grit and a stock of patience; but the fact that with the rudest appliances (ordinary sluice boxes) men have taken out $100 to the pan sends a multitude on a stampede to the scene of such good fortune.

Dawson City is in the British Northwest Territory, about fifty miles east of the Alaskan boundary. About 2000 people are there, and nearly 1000 claims of 500 feet each are staked out. Miners' wages are $15 per day. The country is a rough one, everything freezes solid in winter, and many a poor fellow will wish he had never heard of it. But the fever is on, and thousands will go up there this summer.

Seattle, Wash., July 18, '97.

(Special Correspondence).—Under date of June 22, Mr. B. E. Janes, a University of California graduate, who has charge of the assay office in the Klondyke district, writes from Dawson City:

Bonanza and El Dorado creeks have turned out very much better than anyone expected. Probably $800,000 has already been taken out. They will likely turn out many millions. Gold dust is very plentiful and common now. Everyone has plenty. Dawson is a very lively camp. About 1000

men (che-cka-kers) have come in so far. Most of the rich men here now were new men last year. Mr. Lippy, of whom I have written before, has done about the best. Last fall he hadn't money enough to pay his store bill. He came down last night and is going out tomorrow. He has with him over 200 pounds in placer dust. Besides, he has left sufficient for running his claim for the next year and paid the expenses of the past year—labor $1.50 per hour—which makes the expenses very high. His claim is No. 16, El Dorado. There are about thirty or thirty-five 500-foot claims on El Dorado which will average about the same as his. From Nos. 4, 5 and 6, El Dorado, a man named Berry has taken out over $100,000. On Bonanza there are located 180 claims. Half or two-thirds of them have an average market value of $15,000 to $30,000. A short time ago a man bought a claim for $4500. He set some men to rocking and they took out several hundred to $1000 a day each, and he was able to make his payment all right. A claim four numbers below mine sold for $10,200 to a man who hadn't any money. When the payment became due, which was not in very many days, he sold a half interest for $10,000 cash and met his payment, keeping the dump which had been taken out during the winter containing about $5000 net.

A man on El Dorado has a claim from which he has taken $20,000. He is now ready to sluice and expects it to yield $1000 per day to each man he employs, which will mean several hundred thousand dollars this season.

The other boys who worked in the store have done very well. Stauf quit in February and has property worth tens of thousands, and has more money to handle than any other man here. Baker, who is still in the employ of the company, sold his interests for $7000 or $8000. One man has been buying very heavy. He owes over $100,000 to be paid very soon, but his original claim on El Dorado is expected to pay $30,000 to a box length, *i. e.*, 12 feet. I could not believe it till I came up here and saw the amount of gold and handled it.

The company lost a steamer this spring. The Arctic, which I came up on last year, wintered near Forty Mile. The water fell very fast in the river after the ice went out, and left the steamer high and dry on big blocks of ice in a slough, where the ice had pushed her. In trying to get her out powder was used to break the ice underneath her, and one charge blew her up—that is, loosened the ice suddenly and subjected her to severe strains, so that the bottom leaked very badly. The water began to rise and raised very fast. Finally it got so high and the current so strong through the slough that it carried the boat out into the river, and she stranded on a bar a mile and a half farther down. They have left the hull there, but taken out the machinery and sent it down to be put into a barge. The Bella, a boat built last summer, arrived at Forty Mile June 1st, having wintered at Fort Yukon, about eighty miles below Circle City. She had a fair cargo of provisions, which were taken to Dawson, arriving here the 2nd, since which time the receipts have been over $40,000.

On June 16th the steamer Alice arrived at Forty Mile, having wintered at Androsky near the mouth of the river, about 300 miles this side of St. Michaels. She brought a good many provisions and other articles. I came up on her to Dawson with my outfit. Labor is $1 per hour here, and scarce. Building material is hard to get, and so the store buildings are progressing slowly.

I am working in the store at present, receiving the dust for the sales. It keeps me very busy sometimes. Yesterday the sales were $4500. To-night I weighed up a shipment of over 2000 ounces, to go by the Alice to-morrow. Our safe is almost as full as it can be and contains about $150,000 to $200,000, deposited in small and large lots for safekeeping. Heretofore all gold has been taken at $17 per ounce. With the dirt and all in it it would not average quite that. I have made twenty-three assays of the placer gold so far.

The gold in this district is much lower than in the others, some not going $14, dirt and all. For drafts or currency, we pay only $15.25 for it. The miners don't like it, and think I must be wrong. The other day a man who went out in the winter took out dust which contained El Dorado gold. He got $17.10 per ounce after it was melted. As soon as the miners heard it they were tickled to death and knew I was wrong. When I met the man I found out the gold included a good deal of Forty Mile gold, and $17.10 after melting is only equal to about $16.50 before, so I think the assays I made will stand, though made on small samples.

Every day there is a stampede for a new creek. Every little stream for miles around will be located. This country will pay to tie to for money making. It has been but little prospected.

UTAH.

Salt Lake *Tribune*: At Deep Creek, Mr. McVichie and his associates, working the Pole Star, have followed the vein down a distance of 75 feet from the surface, and it is 35 feet between walls.

Garrison brothers have developed properties on Dutch mountain that promise to make of them wealthy men. The ground is productive of lead and silver.

Work on the Silver King is progressing steadily, and everything in the underground workings looks favorable.

In Dry canyon, which is the principal portion of Willow Springs district, Day & Co. are working a force on the Lion group, from which ore is being taken.

Watson brothers have signified their intention of working the group of claims that was located by them at an early day, at once, and several men are now on the ground.

At Spring creek the Queen of Sheba is making another mill run, and in its workings is some of the best ore that has been uncovered in the locality.

A force of fifteen men have left Richfield to work on the Holland mine, Gold Mountain district, where the owner is planting an amalgamator. Water has run low and the hydraulics have been abandoned. The amalgamator will be set at the mouth of a large open cut on a rich vein of decomposed quartz that has cleaned up well and will be operated by the fifteen men in three shifts.

Grading for the big mill which is to be erected by Capt. De Lamar for the treatment of the big ore bodies that Manager Cohen has blocked out in the Golden Gate mine at Mercur has been commenced. All contracts pertaining to the plant have been let, and in the next four months the plant will be running.

At Park City the Crescent Mining Company is going to make an effort to pay off the $75,000 indebtedness of the company. A force of men will be put to work in a few days taking out ore.

On the Utah Mining and Development Company's property the shaft has reached a depth of 30 feet and is well timbered. It is expected that the vein will be cut when a depth of 80 feet has been attained.

Bingham *Bulletin*: Since the Old Jordan and Galena mines and mill started up last spring there has been an estimated average reduction by the mill of about 100 tons per day, mostly of leasers, ore from the Galena, second grade that was passed in former workings of the Old Jordan, and ore from the dumps which are still heavily loaded. But for upward of a year, and especially since the completion of the South Galena drain tunnel, developments have been steadily progressing in Old Jordan new ground intersected by the tunnel. Large areas of new territory have been opened by tunnels, drifts, crosscuts and upraises.

Mercur *Mercury*: The Geyser-Marion force has been increased from time to time until there are now almost 100 men on the payroll.

The Wachusetts closed down for an indefinite period last week.

Fires were started under the boilers at the Marion last week and about sixty tons a day is being treated.

Silver City *Star*: A survey for a mill for the Star Consolidated Mining Company has been made at Robinson. There are large bodies of milling ore in sight in the North Star, and this move on the part of the company has long been in contemplation.

J. Osborne has commenced work with a force of men on the Silver King claim, which belongs to the Alma Mining Company.

A limited quantity of high-grade ore is now being shipped from the Orient in West Tintic.

Shipments from this end of the district for the week are as follows: From the Swansea three carloads; from the Buckeye, two carloads; from the Iron mine, two carloads daily.

Tintic *Miner*: The Mammoth mill has been started up and now everything is activity in the towns of Mammoth and Robinson.

Salmon *Recorder*: Last week the group of seven claims, in Blackbird district, owned by W. J. Rose, P. Rose, H. Rose, E. Edwards and I. Bohannon, was bonded to W. C. Hall of Salt Lake for $30,000.

Mammoth *Record*: The Emerald shaft has reached a depth of about 650 feet and is being pushed on. Another shift has been put on. At the 700-foot level drifting for the vein will be commenced.

The Mammoth mine mill is now filled to the guards with ore and there is nearly 1500 tons more broken in the mine. About the first of August the force will be increased to what it was before the mill closed. This will give employment to about seventy-five more men.

Whitaker & Burton started work last week on the Home Rule at Diamond. A drift is being run from the bottom of the snaft which is now down 200 feet.

WYOMING.

A large body of low grade, free-milling ore has been found on Battle mountain, near Dixon, and prospectors from all parts of the surrounding country are taking up claims. The ore body is a blanket vein and is found in numerous places on the mountain.

At Grand Encampment the Gold Eagle has opened up to a 4-foot vein of ore paying throughout the entire width. Shipments from this property will begin at once.

MONTANA.

Inter-Mountain: S. Ayotte, the owner of the Celebration in the Mayflower district, is driving the tunnel on the claim to the east end line of the Mayflower No. 3.

D. Reinhart is making preparations to sink a 200 foot shaft on the Sunrise for W. A. G. Birkin.

No ore is being shipped from the Mayflower, but work on the tunnel is in progress. It is said that in driving the tunnel some ore assaying as high as six ounces in gold to the ton was found.

Never before in the history of Butte has there been as much development work planned for the mines of the district as during the present season. Within a month all the big mining companies will be engaged in developing their shafts to a greater depth, and many have just completed the work.

The Parrot Company will begin this week to develop the Minah, a property which was thrown aside several years ago by that company, and the Parrot shaft will also be developed to a great depth.

The Boston & Montana people have decided to begin work on the Moose, which has been idle for a number of years. The old shaft house is being prepared for the reception of large machinery.

A few weeks ago it was stated that the Anaconda Company had erected a mammoth engine at the 1400-foot level of the Green Mountain mine and would sink to the 1800. That work is now well under way. This company will also begin the work of developing the old Bell shaft to a greater depth within a few days. Last week orders were also received from Manager Daly to begin making preparations at once for the development of the shaft of the Mountain Con. No. 1 and the Buffalo to a depth of 2000 feet. It is understood that at the latter level the two shafts will be connected. Around the mines it is stated that Manager Daly has two years' work planned out ahead, and that within a year the company will have four shafts 2000 feet deep.

COLORADO.

Republican: At San Bernardo the San Bernardo mine, on Wilson mountain, which has been a big producer for years, is leased to Sam Wallace & Co., for two years, and preparation is being made to push work, both in taking out ore and developing.

The Butterfly, on Zellow mountain, recently purchased, in connection with the Buckeye, by K. Benson of Ouray, is being put into shape to take out ore. Mr Benson is owner of the Terrible, on the same hill.

On the Eldorado group, purchased a few weeks ago by a Parisian company for $110,000, a force of men are taking out a good grade of gold-bearing quartz from the old workings, while development work is being pushed from several points.

At Cripple Creek all the details in the sale of the Orphan Belle claims Nos. 1 and 2 on Bull hill, save the paying over of the money, have been arranged. The consideration is $450,000, $100,000 cash and the remainder in bankable paper, payable in sixty days. The purchasers are owners in the Calumet and Hecla copper mine in Michigan.

The new lessees on the Jack Pot, Kafier & McMurtray, are in great ore. Last week the work of sinking the shaft was resumed, and at a depth of 50 feet the vein showed 10 feet in width, and practically all the rock in the bottom was pay ore.

In the Birch lease on the Mary McKinnie considerable ore is being taken out, and another shipment will be made in a day or two. The grade of the rock is about 1½ ounces.

On the Ida B. on Raven hill, under lease to J. A. Smith, sub-lessees Bird and others made a shipment of twenty tons lately which was the result of one month's work.

The Moon-Anchor Company has just completed a 70-ton shipment to a local sampler, the average value of the ore being fifteen ounces in gold to the ton. The property never looking better than it does to-day. The Moon-Anchor is producing now at the rate of $1,000 per day at a total cost to the company of not to exceed $200 for each twenty-four hours.

Some Denver parties have started up work on the Alhambra on the southwestern slope of Squaw mountain.

The Bonanza King now has two shafts in ore. One hole is only 20 feet deep, and from the other a drift is in ore at 55 feet. The shafts will be connected.

A week ago Walter Green, who is subleasing on the St. Thomas, broke into a body of ore 30 feet from the surface. He now has over 3 feet of mineral that is high-grade sylvanite rock and assays anywhere from four to twenty ounces.

The output from the Modoc on Bull hill during the month of June reached 125 tons, averaging $60, with a small amount of mill ore sent out in addition. The lessees have been opening the ground at greater depth during the month, and the production was lower than at any time for the past six months.

The Michigan syndicate that recently purchased the Burns of the Acacia Company on a bond and lease, has the new machinery plant in operation, and the shaft is being pushed down for a new level on the ore chute.

The Christmas is again under production, and two carloads of medium-grade ore were shipped last week. The work which is being done under the supervision of the president of the company is more with a view to determining the value of the property than to crowd output.

Tutt & Penrose have started a suit against the Marinette Company, claiming $30,000 damages for refusal of the company to extend their lease on the Abe Lincoln after the property was drowned out by the shutting down of the Arcadia pumps.

The Lawson district of Clear Creek county, while confined almost exclusively to silver-lead ores, has made a record during the past six or seven years.

Ore of a very high grade is being regularly shipped from the Jo Reynolds mine. It is an old producer and is one of the old standby mines of Clear Creek county.

The American Sisters, also an old mine, is a steady producer of high-grade ore, and is one of the most valuable properties in the Lawson district.

The Millington property is now producing ore much of which runs $2,500 to the car and some running as high as $6,000 to the car. Ore is blocked out to the amount of nearly $100,000 in the upper workings.

The Bellevue-Hudson is also producing ore of a high-grade, from its upper workings. The dump of this property contains ore of sufficiently high-grade to stand shipment and is now being worked under lease.

NEW MEXICO.

Silver City *Enterprise*: At Pinos Altos the Treasure Mining Company is sinking the main shaft upon the Atlantic vien, and have reached a depth of 417 feet. Drifts will be started next week. The new concentrating machinery at the mill is working well. The tailings now only carry one dollar per ton as against four to eight dollars by the old method. The new process employed entirely dispenses with amalgamation, the values saved being in the concentrates. The ore is passed through a set a rolls, thence through sizers to three improved Hartz Mountain jigs, where the coarser particles of ore free of gaugue rock, are extracted; the remaining material is then recrushed under stamps to be again concentrated on Gilpin county bumpers, the tailings from the bumpers passing over Wilfley tables which recover nearly all of the remaining metal.

The Maud S mill has started. Good ore bodies are exposed in the 375-foot level of the mine.

The development work on the Confidence mine is showing up good ore bodies in the lower workings. An upraise is being made from the adit level at a point about 1550 feet from the mouth of the level.

The Driscoll Company is working twenty-five men on the old Carrasco dumps concentrating the ora by the old Mexican process of planiering.

J. B. Glichist has thirty-five men employed upon the Guadaloupe, Chino and Oxide mines. He is taking out about 200 tons of second-class ore per month which is shipped.

ARIZONA.

Journal-Miner: The Copper Queen Company one year ago was carrying 600 men on its payroll; it is now carrying 1200.

A deed has been filed for record from A. L., J. W. and A. P. Smith to S. E. Fuller for several placer claims in Weaver district, the consideration being $9500.

Republican: Work upon the shaft of the Copper King is being pushed ahead and blasts in the bottom can already be plainly heard and counted from the workings of the Copper Queen mines, proving beyond a doubt that the Copper King will soon reach the continuation of the same ore body as that upon which the Copper Queen is working.

MEXICO.

(Special Correspondence).—The State of Oaxaca is the most southerly of the Mexican States, with the exception of Chiapas, and extends from latitude 18 deg. 20 min. to the Pacific ocean, a distance of about 180 miles, and from east to west for some 300 miles. It contains 27,470 square miles, (about the size of the State of Maine), and the population is about 1,000,000. It has a great diversity of climate; from the hot lands of the coast and of the Isthmus of Tehuantepec to the bracing atmosphere of the mountains at an elevation of 7,000 to 9,000 feet.

The great Cordillera which extends diagonally across the State from southeast to northwest, and thence through Guerrero, Michoacan, Jalisco, Sineloa and Sonora, is extensively mineralized, and mining has been successfully carried on in many portions of the State. The principal gold belt lies to the west of the capital at a distance of 15 to 25 miles, and extends some 100 miles from Santa Catarina on the north to the Atoyac river on the south.

Santa Catarina is a station on the Mexican Southern, about 50 miles from the city of Oaxaca, and here are found some mines which were worked many years ago, with what results is not known, and which have recently been taken up by Americans. The principal mine shows a 4-foot vein, averaging about an ounce of gold to the ton, without sorting, and from which several carloads have been shipped yielding over three ounces to the ton. The claim is on the side of a steep mountain and can be advantageously opened by means of tunnels to a great depth. There is considerable ore on the dump awaiting the erection of a mill, for though this ore will run over an ounce of gold to the ton, it does not pay to ship, owing to the high cost of freight and treatment—viz., $46, (Mexican) per ton. The gold is very free in the present workings.

From Santa Catarina to the south about 10 miles is Parian, also on the Mexican Southern, the headquarters of several mining companies, whose properties are within a few miles of the town. Perhaps the most important of the mines in this neighborhood is the Rescate, owned by the Rescate Mining Company of Mexico. This mine has produced many thousands of dollars and has been worked for a long time. The vein is some 2 to 3 feet wide, and has been worked to a depth of about 250 feet. The ore is high grade and free. There is water in the lower workings and this has lead to the abandoning of that part of the mine. Other parts of the mine have been allowed to fall in, and, altogether, the mine is in rather bad shape. Some Denver parties have a bond on this property, and are at work cleaning out the old workings.

On the property of the Parian Mining Company work is being carried on under the direction of a competent manager and the companies' mines are in good shape to produce ore at a low cost. The company has ordered a 5-stamp mill to treat its ores, and the ores from neighboring mines as well.

The veins in this vicinity are not wide, averaging about 18 inches; but the ore is of good grade and is all free milling. Most of the ore will run above an ounce to the ton, and much of it will run from two to four ounces. In this neighborhood, as well as near Santa Catarina, there is plenty of timber, and there is enough water for steam and milling purposes. The elevation is about 5,000 feet, and the climate is pleasant and healthy.

The next point near which gold is found is Etla, a station some ten miles from Oaxaca; though there is but little mining going on there at present.

There are some good-looking veins, one or two of which have been worked a little, but the ore is said to be low grade, and the Mexicans are not in the habit of working anything under an ounce to the ton. There would be a good field here for the establishment of a mill to treat ores running about half an ounce, as there is a fine water power, and labor is very cheap.

The above are the only places near the railway where gold is found in paying quantities, or, at least, where the veins have been worked to any extent. Of the mines to the west and southwest, near Penoles, Tlasoyaltepec and San Miguel Peras, the writer will treat in another communication.

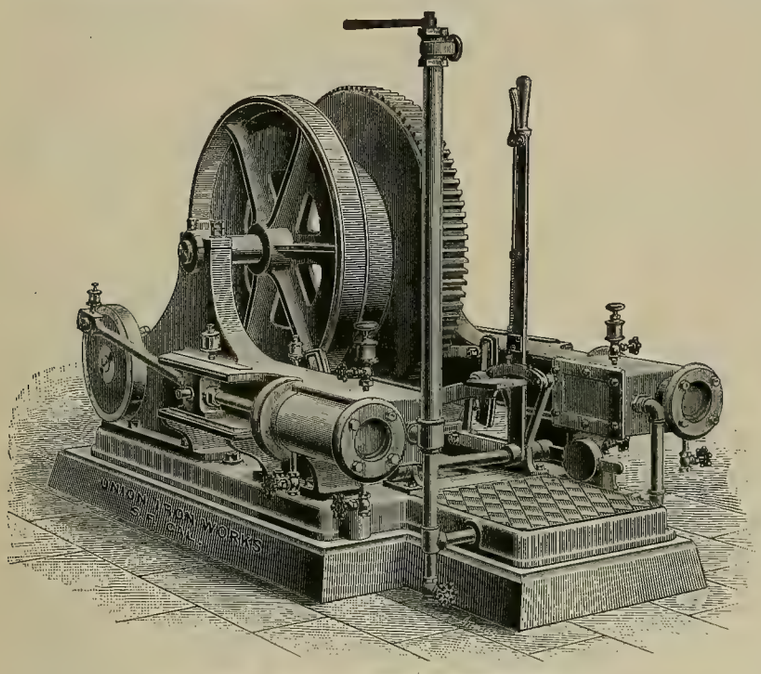
Oaxaca, July 9, '97.

UNION IRON WORKS,

★ ★ 222 Market Street, San Francisco, Cal. ★ ★

MAKE THIS SMALL

DOUBLE CYLINDER SINGLE DRUM HOIST



HOIST FOR PROSPECTING.

For Prospecting Purposes or Underground Work,

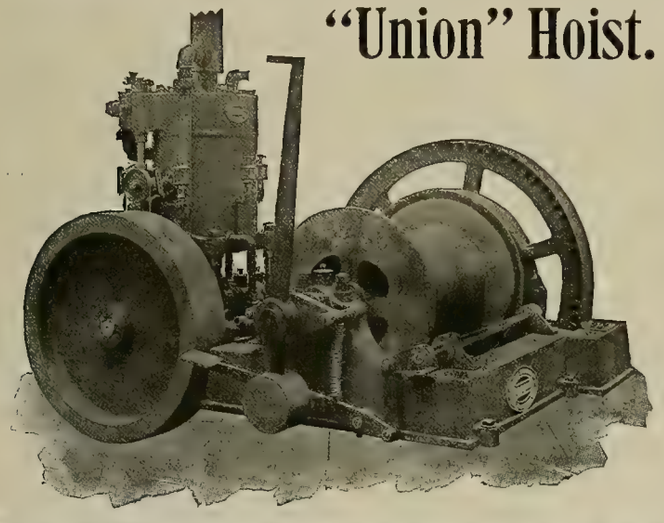
USING COMPRESSED AIR.

The entire hoist is self-contained, being mounted on an iron sole plate or bed which carries all the operating levers and provides a footboard for the operator. The engines are provided with reversible link motion and the drum with a broad strap brake, insuring safe and rapid work.

The general lines upon which this hoist is designed are neat, strong and substantial and all the operating parts are conveniently arranged.

The size herewith illustrated is the 4 in. x 10 in., rated at 15 horse power. The larger sizes, 8 in. x 12 in. and upwards are provided with post brakes.

"Union" Hoist.



The above cut represents our 10 h. p. Double Cylinder Engine of latest type, and Hoist combined on strong iron base. This hoist is designed to raise one ton125 feet per minute from an inclined shaft, or 1500 pounds at the same speed vertical lift. The drum will hold over600 feet of ⅝-inch cable. The outfit weighs 3500 pounds.

THE UNION GAS ENGINE CO.

—BUILD THE—

"Union" Gas Engines,

Which use either Manufactured or Natural Gas, Ordinary Stove Gasoline (Naphtha or Benzine), Distillate or Kerosene.

STATIONARY ENGINES for All Kinds of Work, Built in Sizes from 3 to 200 h. p.
"UNION" COMBINED HOISTS in Sizes from 2 to 40 h. p.
"UNION" COMBINED COMPRESSORS—20, 30, 40 h. p.
HOISTS and COMPRESSORS Can Be Built in Larger Sizes to Order.
"UNION" MARINE ENGINES, 4 to 200 h. p., of Single, Double and Four-Cylinder Types.
TEN YEARS' EXPERIENCE Building Gas and Oil Engines.
"UNION" ENGINES Are In Use All Over the United States.
"UNION" ENGINES Are Simple, Durable and Economical.

Office: 314 HOWARD ST., SAN FRANCISCO, CAL.

Electrical Engineering Co.,

34-36 MAIN STREET,

SAN FRANCISCO, CAL.

Manufacturers of All Kinds of

Electric Machinery

For Mines, Mills and Hoists.

Girard Water Wheel Co.,

34-36 MAIN STREET,

SAN FRANCISCO, CAL.

These wheels are durable, highly efficient, and are the only wheels which have perfect regulation, which feature makes them especially suitable for the operation of electric machinery.

Coast Industrial Notes.

—Twenty eight carloads of California fruit were sold last Tuesday in New York City at good prices.

Los Angeles county is assessed at $103,000,000 this year an increase of $6,000,000 over the '96 assessment.

—Wheat continues to rise in price and is now $27 per ton. California will have a surplus of 500,000 tons for export.

Nearly all the wool of Eastern Oregon, several million pounds in the aggregate, has been sold at 10 cents per pound.

—Water has been turned on in the Yaqui ditch, destined to irrigate the desert lands of the valley of the Yaqui, Mexico.

—Columbia river salmon canners in Oregon and Washington have reduced the price paid fishermen from 4 to 3 cents per pound.

Commissioner of the General Land Office Hermann will appoint two land agents at Circle City and Forty Mile Creek, Alaska.

—Grading on the Valley road from Reedley to Visalia, Cal., has been completed. The Reedley bridge will be completed this week.

—A London corporation is reported preparing to put in an opposition steamship line between San Francisco and Central and South American ports.

The Standard Oil Company is trying to freeze out the Puente, Cal., Oil Company, and has put the price down locally to 9 cents for oil and 10½ for gasoline.

The *Pall Mall Gazette* says that owing to the drouth in South Africa and New South Wales it will be necessary to import a thousand tons of California wheat.

—A representative of a London company is in San Francisco preparing a report on the advisability of starting a new steamship line between San Francisco and Panama.

—It is reported that nearly 10,000 head of horses have been bought between Umatilla, Or., and Castle Rock, Wash., by the Linnton cannery, at an average of $1 per head.

—Sonoma county, Cal., winemakers have agreed to advance $5 per ton for grapes to growers, and within one year pay $1 per ton for each cent per gallon obtained for the wine.

—The Chino, Cal., sugar factory started up last Saturday with 488 men employed. The largest beet crop in the history of the factory will be manufactured, requiring a run of 150 days. The crop refined into sugar will make 33,000,000 pounds.

—The conference committee from both houses of Congress have agreed to a duty on lead ore of 1½ cents per lb., pig lead 2¼ cents per lb., cyanide of potassium 12½%, bituminous coal 67 cents per ton, pine lumber $2 per M., citrus fruits 1 cent per lb.

—The new tariff on Mexican cattle will check the shipment of cattle from Mexico to the United States. During the past two years a very large number were shipped in from Mexico, owing to the low duty of from $1 to $1.50 per head. The new tariff schedules them at $4 to $6 per head.

—The S. F. & S. J. V. R. R. has reached Reedley, California, and it is expected it will be built to Visalia by the 15th prox. In the last fiscal year the company has laid 210 miles of track, built 3000 feet of bridges and constructed 116 miles of telegraph lines, besides sundry road equipments.

—This week the Blue Lakes Water Company near Mokelumne Hill, California, began the operation of its plant, one of the largest on the coast, furnishing water power from pipes at 1500-foot pressure. It is the ultimate idea to furnish light and power to most of the mines in that part of Calaveras county.

—In a race against time to reach the bedside of his dying brother, C. F. Crocker, George Crocker last week made the fastest railroad run on record over the Central Pacific, the last ninety miles from Sacramento to Oakland, including the transfer across the Straits of Carquinez, being covered in one hour and forty-five minutes.

—The Mexican Financial Syndicate, a London company, has been granted a concession by the Mexican Government for the establishment of a steamship line between Guaymas and Salina Cruz and intermediate points on the Pacific. The Government gives a liberal subsidy. The service must be in operation by August 21st.

—The customs business of the Puget Sound Collection District for the fiscal year ending June 30, 1897, shows 2290 entrances, tonnage 1,148,081, and 2307 clearances, tonnage 1,156,653. Imports $7,064,934, as compared with $5,483,846 for 1896. Exports $11,858,062, compared with $6,854,707 for 1896. The total receipts of the district were $272,528. Tacoma's portion of the imports was 83 per cent, exports 49 per cent. There are twelve ports of entry in the district.

—A contract for the transportation of power of the river running through the Santa Ana canyon to Los Angeles and Pasadena, a distance of eighty miles, has been concluded between the Southern California Power Co. and the General Electric Co. The amount of power to be transmitted at first is 4000-horse power. The station will be located in the Santa Ana canyon, twelve miles from Redlands and about eighty miles from the towns in which the electric power will be utilized. The water will be taken from the river through canal, flume and tunnel along the side of the canyon. Here it will be led into a pipe line 2200 feet long, giving what will be equivalent to a vertical fall in the water of 750 feet. The wheels will be of the impact type, directly connected to the generators, of which there will be four, each of 750-kilowatt (1000 H. P.) capacity. The maximum line potential will be 33,000 volts, to which potential the initial voltage will be raised by twelve 250 K. W. step-up transformers. This transmission will be the longest commercial electrical power transmission as yet undertaken, as well as that using the highest voltage. At present the longest is that transmitting the power of the waters of Ogden canyon in Utah to Salt Lake City, a distance of thirty-six miles. The Los Angeles transmission will be over twice that distance, and three times the longest distance yet tried with the power of Niagara, which to date has only been transmitted to Buffalo, a distance of twenty-six miles.

—Japan has no iron ores worthy of mention. The nearest are in Corea and are none too good. She must buy her iron and steel in foreign markets. The nearest is this country. She needs the machinery of her cotton mills, the locomotives and cars, the light-draught steamers, the trolleys which are to carry the bales and the finished goods, the tools and appliances of machine shops, repair yards, graving docks, engine works and electrical plants. She will need turbines, dynamos, motors and illuminating installations. She will need and she will employ, no matter what the cost, the best artisans and experts to oversee and to teach her docile workers. On account of the earthquakes and typhoons in Japan, which are so often a curse to her people, she will be compelled when she begins to build large structures to use the steel frame system so common in this country. She will need steel bridges, steel depots, steel cannon, ships and forts. The nearest land in which to buy these is the United States.

—Of the coal supply of Japan, the Osaka *Mainichi* says: "The advance in the price of coal of late is doubtless due to some extent to an increase in the demand both at home and abroad, but the principal cause is a decrease in production at Kiushu. The chief coal districts of the empire are Kiushu and Hokkaido. If the production of coal in Kiushu has a tendency to decrease, it is of serious import to manufacturers and others. But it is possible that the production in Hokkaido may compensate for the decrease in Kiushu. There are three important coal mining districts in Hokkaido—namely, the mines of the Hokkaido Colliery and Railway Company, and those of Iwanai and Kushiro. The output of the colliery and railway company's mines will, it is estimated, show an increase this year of between 160,000 and 170,000 tons over the amount for last year, and the total output of the other Hokkaido mines is expected to total 640,000 tons, or about three times the output of 1892. The Iwanai mine is worked by two capitalists or owners, and its annual output is not more than 20,000 tons. The output of the Kushiro mine is about 30,000 tons a year. Iwanai and Kushiro coal find a market at Hakodate, Nemuro and Kushiro, and is mostly used as bunker coal. Some coal is mined in the northeastern provinces, the colliery known as Iwaki being the most important of all, from whence comes the Shiramizu, Ibaragi and other descriptions of coal, the total output of which this year is estimated at about 100,000 tons. Lump coal from this colliery is imported into Tokyo, but is of inferior quality and has a poor reputation. Until two or three years ago the Akaiwa colliery in Echigo province had an outturn of about 10,000 tons every year, but its working is now entirely stopped, owing to the competition of the cheaper Hokkaido coal. There is a coal mine at Sakata, but its output is not more than 2000 tons a year. The coal consumption of Tokyo alone is about 400,000 tons annually, of which 250,000 comes from the Hokkaido Colliery and Railway Company and 150,000 tons is Kiushu coal. The demand for coal in the Hokkaido has been increasing at the rate of between 40 and 50 per cent during the past few years. Now one-third of the coal mined by the colliery and railway company is consumed in the Hokkaido, a fourth is exported, and the remainder goes to Tokyo, Echigo, Aomori, Shiogama, Etchu, Echizen and Yokkaichi."

Recently Declared Mining Dividends.

Montana Ore Purchasing Company, $1 per share; payable July 16th.

The Homestake mine of South Dakota, $31,250; payable July 26th.

The New York and Honduras Rosario Mining Company, $15,000; payable July 20th.

Alaska-Mexican Mining Co., 10c per share ($18,000)—its eleventh dividend; payable July 28th.

Alaska-Treadwell M. Co., 37½c per share ($75,000)—its thirty-third dividend; payable July 28th.

Catalogues, Etc.

In somber black with silver lettering comes the July catalogue of the Weber Gas Engine Co., Kansas City, Mo., devoted to their latest prices on machinery.

The Hendrie & Bolthoff Manufacturing Co., Denver, Colo., has issued a specially fine pamphlet too handsome for a "catalogue," but giving similar information. The engravings and presswork are well done, and the descriptive matter is unusually good. The blue and olive tints form an unusual chromatic combination. The frontispiece in design and execution is worthy of the best literary magazines.

"*The Ad Book, a Monthly Exposition of Modern Advertising*," the first publication of its kind in this city is received. It is business, is well edited and printed, and has a good many bright ideas on the important subject of advertising. One is "If you consider advertising an expense, the less you do of it the better." That is a concentrated expression of a business fact. The criticism of advertisements is good and the evils of illegitimate advertising are cleverly set forth. There is a place for such a publication, and its clever compilers aim to fill it.

Personal.

William Letts Oliver is in Montana, looking at some of the mines.

H. C. Erman has been appointed superintendent of the Ortiz mine near Cerillos, New Mexico.

J. R. Sears has been appointed superintendent of the Arbona mine in Tuolumne county, Cal.

A. P. Brayton of the Pelton Water Wheel Co., San Francisco, who has been seriously ill, is convalescent.

F. M. Cartwright has resumed his position of electrical engineer with the Fort Wayne Electric Corporation.

Geo. T. Rives leaves San Francisco next week to take charge of the Golden Cache mine, Illiocett, B. C.

J. D. McKenzie has returned from Chihuahua, Mexico, where he superintended the building of some large gold mills.

A. Neustadter has resigned the superintendency of the Ortiz mine in New Mexico to accept a similar position in Ontario, Canada.

Profs. F. S. Emmons, Henry Gannett and F. H. Newell of the United States Geological Survey, are working up the Tintic district in Utah.

Henry Bratnober, who has been in Alaska in the interest of the Exploration Company, has gone up the Yukon river on an exploring expedition.

James Keegan has been promoted from the position of foreman to that of superintendent of the Mountain Consolidated mine at Butte, Mont., owned by the Anaconda Copper Co.

Joaquin Miller, the Poet of the Sierras, announces his departure for Klondyke, the new Alaska Eldorado. A. T. Hatch, the California fruitman, who recently failed, is another prominent resident who goes to that northern country.

President McKinley has appointed R. T. Rombauer and E. S. Hathaway of Montana, and W. V. Tompkins of Arkansas, as Montana Mineral Land Commissioners. The California Mineral Land Commissioners constitute a very remote possibility.

At the recent trans-Mississippi Congress, in Salt Lake City, Utah, Mr. Benj. C. Wright, for thirty years commercial editor of the San Francisco *Bulletin*, delivered a valuable address on "The Contribution of Western States to the Gold and Silver of the Country."

Charles G. Yale, Edward H. Hamilton, Joaquin Miller, E. J. Livernash and Miss Helen Dare start next week for the Yukon gold fields for the San Francisco *Examiner* and New York *Journal*. All, except Mr. Livernash, will sail on the Excelsior, while he goes by the Juneau route.

The Grass Valley, Cal., Miners' Union has elected the following officers for 1897: J. C. Williams, president; M. M. Wallace, vice-president; E. F. Whiting, recording secretary; M. M. Mitchell, financial secretary; W. H. Bawden, treasurer; G. Stacy, conductor; J. Allen, inside warden; J. Peterson, outside warden; T. R. Edwards, R. D. Gluyas and S. Keast, trustees; J. E. Hogan, member finance committee.

B. F. Allen, Covina, Cal., has been appointed special agent and supervisor of forest reservations in California and Arizona. There are nearly eight millions of acres thus reserved exclusive of those added by order of Ex-President Cleveland. He will have his office in Los Angeles. He says: "The burning or cutting of timber must be stopped. In this, I will have the support of all Californians except those who are engaged in perpetrating these offenses. I will have full power to end the devastation of these forests and will exercise that power to whatever extent may be necessary to protect the forests, but I will, while acting firmly, endeavor to so conduct the affairs of my office that none need fall under the censure of the law. Every possible notice will be given and there is no desire upon the part of the Government or upon my part to oppress or injure any one. It is of the utmost importance to the State of California that the timber should be left undisturbed. All of the rivers flowing into the ocean find their sources in these mountains, and to denude the land there of its timber means to greatly injure the entire State. I will take charge of it and protect it precisely as though it was my own property. In this I am certain that I will have the cooperation and assistance of the people."

Recent California Mining Incorporations.

Jackson Lake G. M. Co., San Francisco; J. M. Sandford, J. J. Scoville, C. O. Poole, W. H. Morton, D. L. Steele; capital stock, $1,000,000; subscribed, $180.

Santa Rosalia Bay M. Co., San Francisco; W. S. Chapman, B. Henley, C. B. Henderson, A. W. Hall, C. A. Macomber; capital stock, $100,000; subscribed, $50,000.

Mazourka M. & W. Co., Los Angeles; C. F. Campbell, F. Manuel, F. A. Hines, B. F. Orr; capital stock, $1,000,000; subscribed, $630,000.

Alaska and Yukon G. E. & T. Co., San Francisco; D. C. Hobart, W. Jones, J. S. Johnson, E. J. Carter, T. Stensel; capital stock, $200,000—all subscribed.

Commercial Paragraphs.

The Bowers Rubber Co. of San Francisco has the contract for supplying the city fire department with hose for the ensuing year.

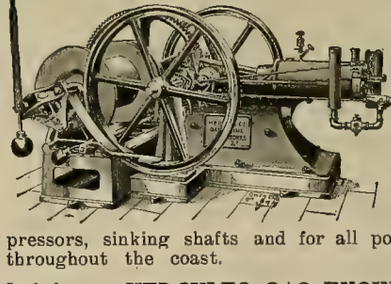
The Pacific Refining and Roofing Co. has moved its office from the Crocker building to more extended quarters at 118 New Montgomery street. The refining works at the Potrero are in full blast and prepared to supply coal tar and asphalt in any quantity.

The St. Lawrence Construction Company of New York has awarded to the Westinghouse Electric and Manufacturing Company a contract for fifteen 5000-horse power generators, to be erected at their plant at Massena, New York; the amount directly involved is about $750,000.

Book Notices.

"*Osborn's Prospector's Field Book and Guide.*" The third edition of this justly popular book, revised and enlarged, shows careful preparation and is of practical value. Chapter V, "Special Mineralogy—Gold," is alone worth the price of the book. It is published by Henry Carey Baird & Co., 810 Walnut street, Philadelphia, Pa., who will send to anyone anywhere, upon application, a four-page circular giving full table of contents. It will also be sent from this office, postpaid, upon receipt of price, $1.50.

Hercules Hoisting Engines



Solve the difficulty of fuel, and make mining profitable where steam power is too expensive. Over 3000 Hercules Gas and Gasoline Engines are in use, giving entire satisfaction. Fully guaranteed. Requires no engineer. No smoke, no dirt. No danger.

We build engines from 2 to 200 h. p. for pumping, hoisting, running air compressors, sinking shafts and for all power purposes. Used in mines throughout the coast.

Send for Catalog to **HERCULES GAS ENGINE WORKS,** 217 BAY ST. San Francisco, Cal.

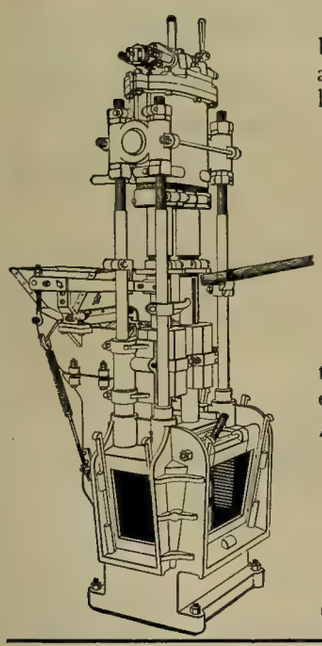
A STEAM ORE STAMP.



One of the BONANZA MINES of the Black Hills was developed by a **TREMAIN STEAM STAMP MILL,** installed last summer at a cost of about $1600. After six months' run the superintendent wrote the following letter:

HILL CITY, S. D., Feb. 2, 1897.

Gates Iron Works, 650 Elston Ave., Chicago, Ill.—GENTLEMEN: It gives me great pleasure in informing you of our success with the Tremain Steam Stamp Mill which we have been running since last July. We have been running on hard, white quartz, some of it of a flinty character and a small portion of it slightly decomposed. We average about ten tons every 24 hours through a forty-mesh screen. If our financial standing had been a little better, so we could have put in a small engine and rock crusher, I am confident we could put through 14 to 15 tons in 24 hours. The wear and tear is considerably less than an ordinary stamp mill, it all being on the shoes and dies. The last we used of these were of the aluminum steel, which are the best wearing shoes and dies I have ever seen. The parts are all well made and durable, I having failed to see any weak point about the machinery.

We use one cord of pine wood in 24 hours, and run the mill with 70 to 80 lbs. of steam.

I have followed mining in connection with milling for thirty years and have never seen its equal for convenience, durability and cheapness. To parties wishing to purchase a quartz mill I cheerfully recommend the Tremain Steam Stamp Mill for its small cost, economy in operation and complete results of working. Very truly yours, [SIGNED] JAMES C. McDONALD,
Supt. St. Elmo M. & M. Co.

This Mill has the capacity of a 5-stamp gravity mill and costs less than half to install. Automatic feeder of approved design. Weight of entire Mill 3300 lbs. Made sectional for mule-back transportation.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

SEWING MACHINE RIPPING ATTACHMENT.—John R. Scott and George W. Spink, East Oakland, Cal. No. 586,292. Dated July 13, 1897. This invention relates to an attachment for sewing machines which is designed to be used to rip seams that have been previously sewed, and it consists essentially of a strip of metal attached to and movable with the needle bar of a sewing machine, having a knife fixed to it, a portion of its front edge extending above and below the knife and flanged outwardly away from the knife, another strip of metal of the same width as the first similarly flanged and of the same length, both being provided with corresponding holes and means for fastening them together with the knife between them. The edge of the knife projects outward sufficiently far to rip the seam, which is pressed against it without danger of cutting the material. When used without a guide both upper and lower ends are bent at right angles so as to connect with the needle bar, but a guide may be used at the top, in which case only the lower end need be connected.

NECKTIES.—Charles W. T. Davies, assignor to the Hand-Tied Tie Company, San Francisco, Cal. No. 586,284. Dated July 13, 1897. This invention relates to an improved article of neckwear specially designed for ladies' or gentlemen's use, and it consists essentially of a center piece, two side pieces secured thereto, said side pieces extending rearwardly from the center piece to form a neck band and also extending forwardly from the said piece to form the tying portion or means for the attachment of the tie and a separable attaching means for connecting the free ends of the rear extensions, or, if preferred, if the tie is permanently made up one end of the center piece may be so arranged as to connect and disconnect. The device serves to keep the tie well in place about the collar, to hold it up in front, and also prevents its slipping up or down with relation to the collar.

ENDLESS BELT CONCENTRATOR.—Jehu Jacobs, Henley, Cal. No. 586,311. Dated July 13, 1897. This invention relates to improvements in that class of mining apparatus known as "endless traveling belt concentrators." It consists in a frame having drums or rollers at opposite ends, with an endless belt passing around them, and a means for gradually advancing it up the incline formed by the relative position of the drums upon the frame, means for producing a transverse oscillating and tilting movement of the belt, a worm gear by which the belt is gradually advanced up the incline and a flexible jointed connection through which power is transmitted to drive the worm, while still allowing the belt to have the transverse movement. By means of a vertically disposed screw the journals at one end of the belt may be raised or depressed so as to change the angle of its travel. In order to keep the edges of the belt upturned so as to prevent the escape of the pulp upon each side, I have shown loose cones at the ends of the rotary supporting shafts, intermediate between the end drums, and these cones act to turn the deges of the belt upwardly along the sides of the top. Washers between the ends of the rollers and the cones, and between the ends of the cones and the bearings, are adjustable so as to regulate the position of the cones as the belt becomes shrunken in its width. The belt itself is composed of overlapping sections of canvas stitched together at intervals so that the overlapping edges form a shallow riffle in the direction opposite to that in which the belt is traveling, and in this riffle the exceedingly fine sulphurets and heavy valuable portions will settle so as to be carried up the incline and eventually be washed off when the belt passes over the lower portion of its travel. The boxes in which the supporting roller shafts are journaled are closed at the ends so as to prevent the rollers from moving endwise.

Mining and Scientific Press, 330 Market St., S. F.

In the Superior Court of the City and County of San Francisco, State of California, Department No. 8. John V. Kimball, plaintiff, vs. Mabel L. Kimball, defendant. Action brought in the Superior Court, City and County of San Francisco, State of California, and the complaint filed in said City and County of San Francisco, in the office of the clerk of said Superior Court. The people of the State of California send greeting to Mabel L. Kimball, defendant. You are hereby required to appear in an action brought against you by the above-named plaintiff in the Superior Court, City and County of San Francisco, State of California, and to answer the complaint filed therein within ten days (exclusive of the day of service) after the service on you of this summons, if served within this county; or, if served elsewhere, within thirty days. The said action is brought to dissolve the bands of matrimony now existing between yourself and plaintiff, on the ground of habitual intemperance on your part for more than one year past. All of which will more fully appear in the complaint on file herein to which you are hereby referred. And you are hereby notified that if you fail to appear and answer the said complaint, as above required, the said plaintiff will apply to the said Court for the relief prayed for in the complaint. Given under my hand and seal of said Superior Court at the City and County of San Francisco, State of California, this 9th day of April, in the year of our Lord, one thousand eight hundred and ninety-seven. C. F. Curry, Clerk. By Joseph Riordan, Deputy Clerk. R. Thompson, Attorney for Plaintiff.

DEWEY, STRONG & CO.,

PATENT SOLICITORS,

330 MARKET ST., - SAN FRANCISCO, CAL.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us to give advice which will give inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address **DEWEY, STRONG & CO., Patent Agents, 330 Market St., San Francisco, Cal.**

MINING AND SCIENTIFIC PRESS,

330 Market Street.....San Francisco, Cal.

Assaying.—Part I—Gold and Silver Ores.
Third edition; Just Out. Rewritten and Improved by the Author, C. H. Aaron. Embraces 130 12-mo pages, with illustrations; well bound in cloth; 1896. Price, postpaid.....$1 00

Assaying.—Parts II & III—Gold and Silver Bullion, Lead, Copper, Tin, Etc.
Latest edition. Contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter. Price, postpaid.....$1 75

Notes on Assaying and Assay Schemes.
By P. De Peyster Ricketts, E. M., Ph. D., Professor in Assaying in the School of Mines, Columbia College, N. Y. Prepared with special reference to the wants of the student and practical assayer. Containing also Rules for the Examination of Mines, Assayer's Outfit, Treatment of Ores, etc. Fifteenth edition. 8vo., cloth.....$3 00

Prospector's Field Book and Guide.
By H. S. Osborn.....$1 50

A Practical Guide for Prospectors and Miners.
By C. W. Moore. With numerous illustrations.....$4 75

Roasting of Gold and Silver Ores and the Extraction of their Respective Metals Without Quicksilver.
Second edition. By Guido Kustel, M. E. Contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. Price, postpaid.....$3 00

The Lixiviation of Silver Ores with Hyposulphite Solutions.
With special reference to the Russell Process. Second edition. Completely revised. By Carl A. Stetefeldt. Price, bound in cloth.....$5 00

Modern Copper Smelting.
By Edward Dyer Peters, Jr. Seventh edition. Rewritten and enlarged. Profusely illustrated.....$5 00

Electricity in Mining.
By Sylvanus P. Thompson.....80 cts.

Practical Treatise on Hydraulic Mining.
By Aug. J. Bowie, Jr. On the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on heavy grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc Price, postpaid.....$5 00

Practical Hydraulics.
A book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers and Irrigators. By P. M. Randall. Contains useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulæ, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules and tables are prepared. Is specially applicable to the Pacific Coast. Price, postpaid, $2

The Metallurgy of Silver.
By M. Eissler. Profusely illustrated.....$4 00

Manual of Mining.
For the use of Mining Engineers and Technical Schools. Treating of Preparatory and Exploratory Work, Methods of Mining, Hoisting Machinery, Pumping, Ventilation Shafts, Tunnels, Blasting, Timbering, etc., etc. By Prof. Magnus C. Ihlseng, E. M., Ph. D. Second edition, with Appendix. 500 pages, 8vo., cloth.....$4 00

The Explorer's and Assayers' Companion.
A third edition of selected portions of the "Explorer's, Miner's and Metallurgist's Companion." By J. S. Phillips, M. E. A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying and Metallurgy. Price, postpaid.....$6 00

Aaron's Leaching Gold and Silver Ores.
By C. H. Aaron. The most complete handbook on the subject extant; 164 pages, octavo. Illustrated by twelve lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, postpaid.....$3 00

Manual of Assaying—Gold, Silver, Copper and Lead Ores.

RISDON IRON WORKS,

Office and Works, Cor. Beale and Howard Sts., SAN FRANCISCO.

MINERS, ATTENTION!

We beg to call attention to our "RISDON HAMMERED" Shoes and Dies, which are made of a special quality of steel, are hammered and then compressed in moulds so as to give the greatest possible density.

These Shoes will outlast any other make and will not chip or cup.

We have attached a sketch showing sizes; fill in the size of your Shoes and Dies, and order a trial set.

Our prices are as low as any, and the article we offer should commend it to all mine owners and mill men.

FINCH & CAMPBELL, GENERAL MANAGERS. WALLACE, IDAHO, June 18, 1897.

The Mine and Smelter Supply Co., Denver, Colo. GENTLEMEN: Replying to your favor of the 8th inst., regarding my experience with the "Wilfley Concentrating Table," will state that in February last I placed in the vanner room of the Standard mill one of your tables which has been in constant use every day since. It has been operated by the usual attendant of the vanners and has been given no special attention, and has been supplied with the same "feed" as the Frue vanners, and at the end of each day's run has shown lower tailings than the vanners and produced from three to four times the quantity of concentrates of the same value per ton as any of the Frues. We have three more of the Wilfleys in the same mill which are all doing splendid work and handling fully twenty tons each per day of siliceous ore carrying about 10 per cent lead and 12 ounces silver. They are all making a remarkably close saving of values and giving the most perfect satisfaction. A very fair opportunity is offered in this mill for comparing the work of different concentrators, as we are using Harz jigs, Collom jigs, round buddles, Frue vanners, and Wilfley tables, and handling nearly 500 tons of crude ore per day, and all of the machines are given the class of work for which they are best adapted. I can heartily recommend the Wilfley to any one needing a concentrator for fine ores.

Yours very truly. EMERSON GEE, Manager Standard Mining Co.

These Tables have displaced belt tables of almost every make, as is shown by letters in our possession.

PRICE, $450.00.

Market Reports.

The Markets.

SAN FRANCISCO, July 22, 1897.

General trade continues to enlarge with both jobbers and distributors disposed to buy in larger quantities. This is quite a departure from the conservatism which has marked business for a long time past. It shows re turning confidence based on higher prices for farm products, the gold mining industry still forging ahead and every other industry feeling the beneficial effect. There is no doubt that merchants and, as a rule, manufacturers are making more money than they have for several years past, but they have been so habituated to speaking in a pessimistic way that it is second nature to cry hard times. Collections are reported good from mining districts and lumbering camps, and improving from farming sections. It is the general belief that many grain farmers will be able to get out of debt this year, while others will have their indebtedness reduced quite materially. The East reports improving business, with the outlook quite promising for more general activity than for several years.

The local money market continues easy, with outside capital seeking profitable investment. The banks report large surplus funds on hand with, so far, the call for crop-moving purposes not so large as was expected by them. The light demand is due largely to better accommodations in the interior. It looks now as if farmers will market their products early and not hold for a market, which, if done, will ease the situation still more. Our advices state that fruit dr ers, fruit and salmon cannerymen are marketing their packs at current prices: this will also provide more funds. The flood of gold from Alaska is having its effect, for the belief prevails that the bulk will go into circulation either in loans or in investments. Our New York correspondent writes: It is evident that there are enormous amounts of money in this city belonging to life insurance and other great corporations awaiting suitable investment, which they are placing on call loans so as to draw it in when required for investment. There is very little demand for time money just now. In connection with the statements regarding the location of the gold stocks in Europe, it is perhaps worth noting that in addition to the actual gold holdings reported by Russia and Austria, both these countries hold bills of exchange on other centers which can be collected in gold at any time. Russia holds about $6,500,000 of these, and Austria over $11,000,000. Italy also has about $14,500,000 of bills of exchange or credits for the purpose of paying coupons on its foreign debt.

Under date of July 16, J. F. Matthews & Co. of New York City write:

SILVER EXPORTED FROM THE PORT OF NEW YORK, JULY 1ST TO DATE.

Date.	*Steamship.*	*Ounces.*	
July 10..	Etruria....	494,000	
July 13..	Saale.. ...	225,000	
July 14..	St. Louis..	437,000	
		1,156,000 @ 60¼c —	$ 695,045 00
Reported July 9....		1,322,000	794,852 50
Total.....		2,478,000	$1,489,897 50

Commercial price of bar silver, closed yesterday, 60⅜. Mexican silver dollars, 46⅞@48⅜. Bar silver in London, 27 9–16d.

COPPER.

There is nothing new to report in the copper market since our last issue. The export movement continues and prices are practically unchanged at 11⅜@11¼c for Lake, 10¾@10⅞c for Electrolytic, and 10½@10¾c for Casting. In London copper closed: Spot, £47 15s; Futures, £48 2s 6d. Market quiet, but firm.

LEAD.

The market is rather weaker than it has been of late, and a few holders seemed inclined to sell at prices on the basis of 3.65c for carload lots. London cable quoted soft Spanish at £12 3s 9d.

New York Silver Prices.

NEW YORK, July 22.—Following are the closing prices for the week:

	Silver in— *London.*	*N. Y.*
Friday	27⅜	60¼
Saturday	27⅜	60¼
Monday	27⅜	60¼
Tuesday	27 9–16	60⅜

London Sight Bankers	$4.88
Refined Silver, per oz., 1000 fine	59⅝
Mexican Dollars	49@49⅜

SILVER.—The market held to steady prices up to Tuesday, when it was easier at a slight decline. On Wednesday the market was still lower. The decline is said to be due to the belief that the silver pool formed many months ago has unloaded the bulk, if not all, their holdings, and, with a very light demand from any country and no moneyed pool to sustain values, prices have set off. The Indian loan may also have its influence, and also the marvelous reports from the Alaska gold find, under the belief that when the source of the gold flow is found, the ledges will be large and rich. Everything is taken advantage of to depress the markets at home and abroad for silver.

MEXICAN DOLLARS.—The market is weak at quotations, in sympathy with silver. The steamer to leave next Friday will take out liberal consignments to Hongkong.

QUICKSILVER.—Our market is quiet, with some shading under quotations.

Our market is quoted at $40 for domestic consumption.

COPPER.—The markets here, at the East and abroad have been fairly firm the past week. The consumption abroad continues heavy, while in this country it is steadily increasing.

The local market is quoted as follows:

Ingot casting, jobbing	13@—
Ingot " wholesale	12½@—
Sheet copper	—@16½
Bolt	¼ and 5-16, 20c; ⅜ and larger, 16½

TIN.—The market is firm for pig. In tin there is some cutting. The demand is slow.

The market is quoted in jobbing lots as follows:

Pig, per lb., jobbing	—@ 15
Plate, I C coke, heavy, per box	$4 10@4 25
" " light, "	4 00@—

LEAD.—The market strengthened at the East, closing strong at the advance. With us quotations have not been marked up, but will be soon, if the advance is maintained at the East.

Our market is quoted in jobbing lots as follows:

Pig	—	@	4 50
Bar	—	@	4 60
Sheet	5 75	@	6 00
Pipe	5 00	@	5 25

SHOT.—The market does not follow lead, owing to a fight on from the East.

Our market is quoted as follows:

Drop, sizes smaller than B, per bag of 25 lbs	$1 35
Drop, B and larger sizes, " "	1 60
Buck, Balls and Chilled, do, " "	1 60

POWDER.—The market is steady.

The market is quoted as follows for Hercules: No. 1, from 11¾c to 17¼c, according to strength and quantity; No. 2, from 9c to 11c, according to strength and quantity.

IRON.—The market is reported steady to firm for both foreign and American. The East reports a very heavy consumption and fair export movement.

AMERICAN.

	To Arrive.	*Spot.*
Sloss	$20 00	$22 00
Thomas	21 00	22 00
Salisbury	29 00	31 50

ENGLISH.

Barrow	$21 00	$23 00
Gartsherrie	21 50	23 00

COAL—If the tariff bill passes it ought to help domestic some. The demand is good for the season. The market is fairly steady. The cargo of coal brought by the bark Theobald from Cook's Inlet, Alaska, for the North Pacific Mining and Transportation Company has been sold to a large operator.

We quote as follows:

SPOT FROM YARD—PER TON.

Wellington	$8 00@— —

ANTIMONY.—The market is steady.

Our market is quoted at 7¼@8¼c in a jobbing way. New York mail advices quote 7½c for Cookson's, 6⅞@7⅛c for Hallett's and 6⅞@7c for Japanese.

NAILS.—The market is strong.

Wire, carloads, basis per keg		....
" jobbing, " "		$2 35
Cut, carloads, " "		....
" jobbing, " "		2 25

BORAX.—The market is steady.

The market is quoted as follows:

Refined, in carload lots, in barrels	5
Refined, in carload lots in sacks	4¾
Powdered, in car lots	5
Concentrated, "	4½

PLATINUM.—The market is quiet.

Our market is quoted in a jobbing way at $15 per ounce and for scrap $10 an ounce.

ZINC.—The market is steady.

Our market is quoted at 10 to 15 cents, according to thickness.

ALUMINUM.—The market is steady.

We quote in jobbing lots at 50 cents per pound for ingots.

Chemicals.

The market is practically unchanged pending the passage of the tariff bill. It is stated that heavy stocks of all kinds affected by the bill are held at the East and also on this coast. It is not at all unlikely that several changes in quotations will be made soon after the bill is law. The consumptive demand is fair to good.

SULPHURIC ACID.—The demand is fair.

We quote in a jobbing way at 1½c per lb for 66°.

ACETIC ACID.—The market is steady at 6 to 12c per pound from store for carboys, according to make.

NITRIC ACID.—Our market is reported firm from store at 6½@7c per pound in carboys.

BLUE VITRIOL.—Our market is steady.

We quote in a jobbing way at 4½c per pound.

SPELTER.—The market is quiet

We quote our market in a jobbing way at 5 cents a pound.

BISMUTH.—The market is steady.

Our market is quoted in a jobbing way at $1.50 a pound.

BONEASH.—There is a fair movement at steady figures.

Our market is quoted in a jobbing way as follows: Extra, 4c a pound; No. 1, 3½c; No. 2, 2½c.

PHOSPHORUS.—The market is firm.

We quote in a jobbing way at 70 to 75 cents per pound.

SODA ASH, 58% (LeBlanc process).—The market is firm at $1.55 per 100 lbs. in a jobbing way.

CAUSTIC SODA, 60%.—The market is quiet at 3c per pound in a jobbing way.

HYPOSULPHATE OF SODA.—There is a fair demand at 2½c a pound from stores.

NITRATE OF SODA.—Market is steady.

Our market is quoted from store at 4c for 95%.

Mining Share Market.

SAN FRANCISCO, July 22, 1897.

There is no doubt that the support given the market by some unseen moneyed force, combined with active speculation at the East in sugar stocks, with which other securities sympathize, is having a favorable influence, and if continued our market, it is the belief with operators, must also have a bull movement. It would not take much to bring it on, for the public are ripe for speculation and any signs that mining shares are being manipulated by a moneyed pool will unquestionably draw in large numbers from the outside. Then there are other very important factors which are creating a bullish sentiment, viz., improving business, higher prices for nearly everything grown or raised on the farm, the large packs of canned and dried fruit meeting with ready sales, canned salmon—the largest pack on record, valued at over $8,000,000—meeting with quick sales at home and abroad, and the gold mining industry booming ahead. That the inside moneyed pool can have two or more bodies of good grade ore shown up when desired is the firm conviction of mining men conversant with the Comstock mines, but when it will be is the problem to solve. Without considerable ore shown up it will be impossible to promote a good-sized deal, unless there are several million dollars pooled for the purpose, so as to catch a large short interest. Considerable attention is attracted to the work in the Chollar mine on the Brunswick lode, but better informed miners watch that in Potosi on the Comstock lode. The belief prevails that in Sierra Nevada not much ore will be found yet awhile; but if there are enough shorts out some ore will be found, or at least reported, so as to advance prices to make them fill. The work in Con. Virginia is again attracting attention, but in a quiet way. The promised ore developed in Alpha, and also in Con. Imperial through the joint crossdrift of Confidence, Challenge and Con. Imperial, has not materialized yet, but shares of the two latter are firmly held. There is considerable writing up and many points out on Yellow Jacket. They are bullish with big things ahead as the work on the 1000-foot level progresses. Some attention is also given to the joint work to the west that is being done in Kentuck by Yellow Jacket, Kentuck and Crown Point.

From the Comstock mines official advices do not report any material change in the general situation; but, owing to progress made at several points, all information is eagerly sought, and, as usual, grapevine advices have been set afloat for the benefit of the more credulous. In Utah they are still running, but at a slow pace, the north drift from the main west tunnel crossdrift. Nothing of note has been found. In Sierra Nevada work is continued on west crossdrift No. 3 on the 900-foot level without finding anything of material interest as yet, but outsiders expect the crossdrift to run into ore any day. No change is reported in the work on the Layton tunnel level. In Union they continue to run south from an upraise on the 900-foot level. They are in about 300 feet on the 1000-foot west crossdrift. As they have reached promising vein matter, it seems as if the work ought to be stopped, unless they can go still further west without striking ore. Work in Ophir is reported on the 1000-foot and Central tunnel levels. No change is reported in the formation. In Con. Virginia active exploiting work is carried on on the 1000-foot, 1550-foot and 1650-foot levels. So far as official information goes, there is no change worthy of note, but private information is said to be more encouraging. No change is reported in the Best & Belcher and Gould & Curry joint work. No work is reported by Hale & Norcross and Chollar. From Savage nothing new is reported. There ought to be an improvement before long. They are working west on the 450-foot level of Potosi. About thirty-nine tons of fair-grade ore were extracted last week. They sent to the mint bullion of the par value of $5564, of which $2391 was gold. From Bullion nothing new comes to hand. They are still fooling around in Alpha on the 500-foot level. In Yellow Jacket they are opening up the 1000-foot level. In Kentuck the joint work of Yellow Jacket, Crown Point and Kentuck ought to attract attention soon—probably after the treasury stock of the latter has been sold.

Official letters filed this week reports that work has been suspended in Belcher. From Crown Point nothing of interest is reported. The same can be said of Confidence and Overman. The joint west crossdrift of Challenge, Confidence and Con. Imperial has been extended so far in that it is so hot that they have to pump air in.

Interest in work on the Brunswick lode still centers in Chollar as it goes towards Potosi, although some are watching developments on

Machinery at the State Fair.

TO THE EDITOR:—The California State Fair this year will be held at Sacramento, beginning September 6th and continuing two weeks. In recent years the machinery exhibits at the State Fair from San Francisco manufacturers have not been as extensive as they should. As a business proposition, it would warrant the manufacturers of all kinds of machinery to make an elaborate display if they desire to keep in touch with the people of the interior. San Francisco has to depend largely upon certain sections of California for this character of trade, and in no way can they better advance their own interests than by making displays of their own goods and wares at the California State Fair.

These annual exhibitions each year are largely attended by the people of the mining districts, who come here for no other purpose (there not being any outside attractions) than to devote their time to the State Fair.

We should certainly like to see a working exhibit of mining machinery, and will furnish all the assistance possible to promote this interest. No charge is made for power or space, and, as transportation is free, the only expense attendant on exhibits from San Francisco is drayage at both ends and a few days' time in arranging exhibits at Sacramento.

As the mining interest is again prominent in this State, we hope to see an extensive exhibit of mining machinery at the State Fair this year. Very truly,

EDWIN F. SMITH, Secretary.

Sacramento, Cal., July 19, '97.

What Mr. Smith says of the State Fair as a place for exhibiting is quite true, and especially for exhibiting whatever will interest the miners, for from the mountains every year come a great many people from the richest mining districts of the State, and they are about the only class of people who have money to spend in these times.

This matter is well worth the favorable attention of manufacturers of mining machinery. Mr. Smith proffers suitable space for exhibition, will furnish free power, and such an opportunity should be embraced.

Rainfall and Temperature.

The following data for the week ending 5 A. M., July 21, 1897, are from official sources, and are furnished by the U. S. Weather Bureau for the MINING AND SCIENTIFIC PRESS:

Assessment Notices.

ROSE CREEK MINING COMPANY. Location of principal place of business, San Francisco, California; location of works, Star, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 24th day of June, 1897, an assessment (No. 1) of 15 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room 85, Crocker building, Junction Post, Montgomery and Market streets, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 21st day of August, 1897, will be delinquent and advertised for sale at public auction, and unless payment is made before will be sold on TUESDAY, the 14th day of September 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. M. WILMANS, Secretary.

Office—Room 163, Crocker building, San Francisco, California.

BEST & BELCHER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia District, Storey County, Nevada.

Notice is hereby given that at a meeting of the Board of Directors, held on the 1st day of July, 1897, an assessment (No. 62) of 25 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, room 23, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 5th day of August, 1897, will be delinquent, and advertised for sale at public auction; and, unless payment is made before, will be sold on THURSDAY, the 26th day of August, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

M. JAFFE, Secretary.

Office—Room 33, Nevada block, 309 Montgomery street, San Francisco, California.

OSCEOLA CONSOLIDATED MINING COMPANY. Location of principal place of business, San Francisco, California; location of works, Amador County, California.

Notice is hereby given that at a meeting of the Board of Directors held on the 30th day of June, 1897, an assessment (No. 6) of 1 cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, 307 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 2nd day of August, 1897, will be delinquent, and advertised for sale at public auction, and, unless payment is made before, will be sold on SATURDAY, the 21st day of August, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

HOLLAND SMITH, Secretary.

Office—307 Montgomery street, San Francisco, California.

THORPE MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Fourth Crossing, Calaveras County, California.

Notice is hereby given that at a meeting of the Board of Directors held on the 9th day of June, 1897, an assessment (No. 7) of 2½ cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, room 44, Phelan building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 17th day of July, 1897, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on MONDAY, the 9th day of August, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

A. F. FREY, Secretary.

Office—Room 44, Phelan building, San Francisco, California.

POSTPONEMENT.

By order of the Board of Directors, the day of delinquency of the above assessment has been postponed to July 31st, 1897, and the day of sale to SATURDAY, August 21st, 1897.

A. F. FREY, Secretary.

Office—Room 44, Phelan building, San Francisco, California.

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by the hydraulic process from the May Flower Gravel Mining Co., in the May Flower Mine, near Forest Hill, Placer Co., to deposit tailings in Black Hawk Creek; from Dr. J. P. Welch, in the Pactolian Mine, near Genesee, Plumas Co., to deposit tailings in Grizzly Creek; from the Gold Bug Mining Co., in its mine near Georgetown, El Dorado Co., to deposit trilings in Canon Creek; and from E. D. Bowman et als., in the Eclipse and Boston Claims, near Onion Valley, Plumas Co., to deposit tailings in Poorman's Creek, gives notice that a meeting will be held at room 59, Flood Building, San Francisco, Cal., on August 2, 1897, at 1:30 P. M.

GOLD IN COLORADO!

Colorado has within its limits some of the greatest gold mines that has ever been discovered. In Cripple Creek in 1892 there were a few prospectors looking over the hills; in 1895 the camp turned out over $8,000,000 in gold. Leadville, the old bonanza camp and the mineral product of which made Denver what it is to-day, is becoming a big producer of gold. New inventions for working low-grade gold ores, together with the discoveries made to work rebellious ores, have opened up a field for the miners such as they have never enjoyed before, and Colorado has inducements to offer such as no other district in the world possesses, the record of the State in gold production for the last three years speaks for itself. Among the other prominent camps in the State are Telluride, Ophir, Rico, Silverton, Mineral Point, Durango, La Plata, Ouray, Saw Pit, Ironton, the Gunnison district and many others. New finds are being made and new camps are springing into existence every day. The Denver & Rio Grande Railroad, which is the pioneer road of Colorado and which has always been the miner's friend, reaches all the mining camps in Colorado. For elegantly illustrated descriptive books, free, of mines in Colorado send to

Assaying Gold
.....AND.....
Silver Ores.

By C. H. AARON.

A Standard Work.

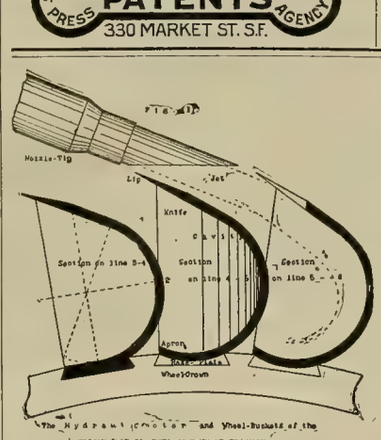
THIRD EDITION JUST OUT.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the pratical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores,") that have been "successfully popular," is written in a condensed form, which renders his information more readily available than that of more wordy writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:—Perface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assay; Examples of cupellation; Weighing of Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests of Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 126 12-mo pages, with illustrations, well bound in cloth; 1896. Price $1.00 postpaid. Sold by the Mining and Scientific Press, 330 Market St., San Francisco.



The Hydraulic Motor and Wheel-Buckets of the AMERICAN IMPULSE WHEEL COMPANY OF NEW YORK.

The CAZIN WHEEL.
PATENTED MAR. 16, 1897.
Will furnish more power per cubic foot of water used than any other water wheel in the market.

No. 1934.—VOLUME LXXV. Number 5. SAN FRANCISCO, SATURDAY, JULY 31, 1897. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

A High-Speed Battery.

The *South African Mining Journal* notices that English technical engineering journals have been commenting on a paper, "Gravitation Stamp Mills for Quartz Crushing," recently read by D. B. Morison before the North-East coast institution of engineers and shipbuilders, in which, after commenting on the characteristics of the latest pattern of gravitation stamp, the author describes an innovation of his own design which he suggests is in the only direction in which he can find an opening for improvement on existing designs.

Mr. Morison recognizes the indisputable value of the Californian stamp as at present evolved, and retains the whole battery, except cams and tappets. He thinks that in the matter of battery-box, screens, stamp-heads, shoes, dies, etc., the present mill has practically reached finality as regards improvement; and that as far as lifting mechanism is concerned, the speed attained has practically reached its limit as regards the cam. He would replace the cam by the crank, a departure by no means new, but undoubtedly capable of further refinement. Some kind of spring or buffer being indispensable with the crank-action, he has selected a piston in which water and air are confined.

The points on which Mr. Morison's design differs chiefly from the ordinary Californian stamp are these: On the top of the battery frame is a crank-shaft with five cranks at equal angles, each of which is provided with a connecting-rod jointed to a cylinder in such a way that, as the crank revolves, the cylinder moves up and down. Within the cylinder is a piston, the rod of which passes through the cylinder bottom, and constitutes the stem to which the stamp is attached. A jacket surrounds the cylinder, and at a distance from the bottom is an aperture communicating with the jacket-space; while another aperture at the top of the cylinder connects it also with the jacket. The cylinder below the lower part is filled with water, the jacket as well containing water, and above the liquid in both cylinder and jacket is an air-space. To the water is added a sufficient quantity of soap to serve the purposes of lubrication and to prevent corrosion.

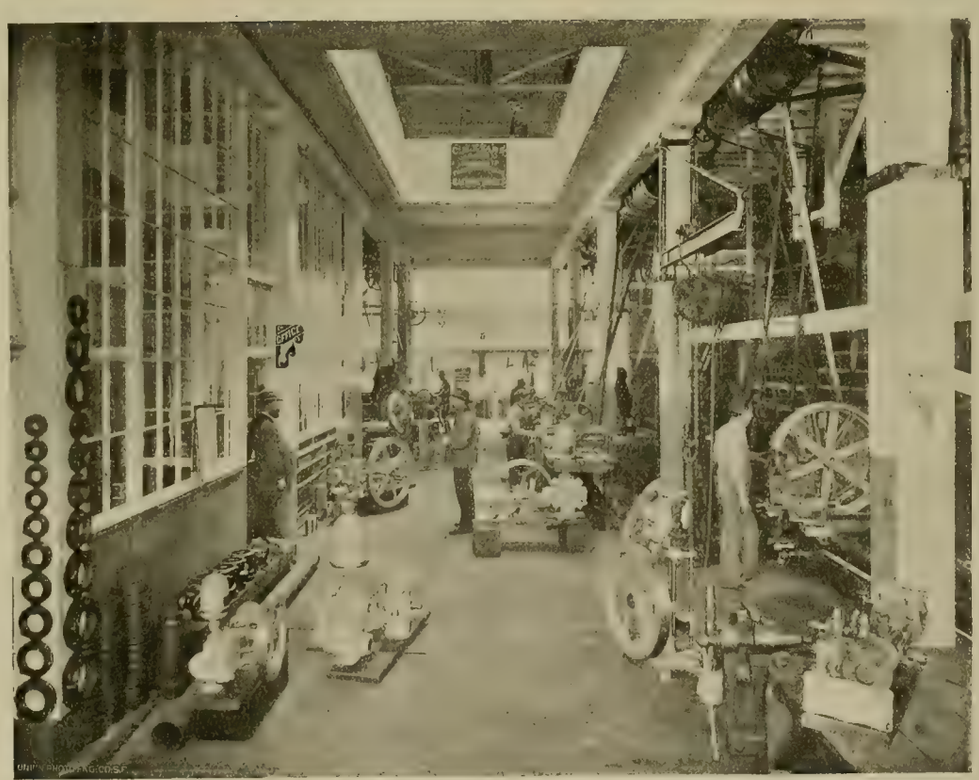
The most notable features to those who conducted the trials with this high-speed mill were: That a comparative low speed with a 900-lb. head gave, under the normal conditions of wet-crushing, 125 and 130 drops a minute; the great difference in vibration, there being no shock, as the liquid is gradually squeezed out until the resistance of the weight is overcome; absence of the usual noise, excepting that due to the blow on the dies; and an increase of 17 per cent in energy of blow per drop as compared with the cam.

The adherents of the new battery claim that faster crushing will probably mean the production of less slimes; but this probability does not, from the accounts to hand, by any means appeal to our contemporary. The wash or splash in the mortar-box due to the high speed of 125 drops is such that a much deeper screen has already been found necessary; it remains, however, to be seen whether the increase of the discharge capacity in proportion to the increase of drops is so simple a matter as it is assumed to be. The design is said, further, to lend itself to an increase in the weight of the stamp up to 1500 or 1800 lbs.—a supposition which may or may not be realized. Whatever the merits of the new design may be, it is an interesting departure from the beaten track, and deserves a thorough and impartial test under normal working conditions. Its shortcomings are likely to be found in the direction of a loss of simplicity in construction and of greater liability to get out of order, as well as in the tendency to increase the percentage of slimes, mechanical disabilities within the power of miners to overcome.

GAMBETTA MINE, MADERA CO., CAL. (*See page 96.*)

Modern Machine Works.

The accompanying engraving (the interior of C. H. Evans & Co.'s Machine Works) illustrates the advance being made along common sense lines in modern machine practice. Contrasted with the darkness, foul air, crowded space and inconvenience of some old-time machine shops, the one here represented is as the incandescent light compared with a tallow dip. Here, in connection with all the latest appliances for the work in hand, are cleanliness, good air, abundance of light and absolute order prevailing in every department. The works occupy the two floors of the new brick building Nos. 183-185-187 Fremont St., San Francisco, each floor having an area of 50x100 feet. The lower floor is concrete and carries the heavier machinery (office and salesroom showing on the left). It is lighted from the roof, as well as from the front and rear, a crane traveling its full length. The upper floor is used for draughting room, pattern shop, storage of patterns, finished work, etc. This firm was established in 1875. It does an extensive business in steam pumps for all purposes, marine engines, etc., and is well and widely known all over the Pacific coast.



INTERIOR OF C. H. EVANS & CO.'S MACHINE WORKS.

MINING AND SCIENTIFIC PRESS.

ESTABLISHED 1860.

Oldest Mining Journal on the American Continent.

Office, No. 230 Market Street, San Francisco, Cal.

ANNUAL SUBSCRIPTION:

United States, Mexico and Canada..... ....$3 00
All Other Countries in the Postal Union..... ..... 4 00

Entered at the S. F. Postoffice as second-class mail matter.

J. F. HALLORAN.....General Manager

TO THE PUBLIC.

No one is authorized to solicit business for this paper unless in possession of proper credentials and regularly numbered and stamped blank subscription receipts.

San Francisco, July 31, 1897.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Gambetta Mine, Madera Co., Cal.; Interior of C. H. Evans & Co.'s Machine Works, 93. Chain Coal Cutter; Three-Phase Vertical Triplex Pump, Driven by 5 H. P. Induction Motor; Double-Acting Horizontal Triplex Pump, 75 H. P. Induction Motor; 30 H. P. Hoist and Induction Motor, 100. Magic Patent Adjustable Die Stocks, 101.

EDITORIAL.—A High-Speed Battery; Modern Machine Works, 93. Sixth Annual Convention of the California Miners' Association; Lowest Price in the History of Silver; Unused Money in a Denver Bank; Dividend-Paying Mines in California; Klondycitis and Alaskamania, 94.

ELECTRICAL PROGRESS.—Electricity in Mining, 100. Cost of Power for Trolley Cars, 101.

MECHANICAL PROGRESS.—Adjustable Die Stocks; Importance of Leaks in a Steam Plant; Objection to the Use of Rubber; The Manufacture of Steel Barrels; Nickel-Steel for Shipbuilding; A New Fireproof Building Brick, 101.

SCIENTIFIC PROGRESS.—A Greenwich Transit; A Remarkable Patent; Fluorine Liquefied; An Ocean of Liquid Air; Surpassing Man in the Ratio of Brain Weight to Body Weight; The Extreme Degree of External Atmospheric Heat; Patterns on the Finger Tips Unchangeable, 101.

MINING SUMMARY.—From the Various Counties, of California Nevada and Other Pacific Coast States and Territories, 102-103.

THE MARKETS.—Eastern and Local Markets; Mining Share Market; Sales in San Francisco Stock Board; Notices of Assessments, etc., 114-115.

MISCELLANEOUS.— Concentrates, 95. Mines of the Gold Belt; Transmississippi Congress, 96. The New Labor Law; Report of the De Lamar, Idaho, Mining Co.; Ingenious Signal Bell Arrangement, 97. Treatment of Low-Grade Ores by Concentration, 98-99. Temescal Tin Deposits; "Further Contributions to the Geology of the Sierra Nevada, 99. Coast Industrial Notes; Personal; Recently Declared Mining Dividends; Recent California Mining Incorporations; Commercial Paragraphs, 105. List of U. S. Patents for Pacific Coast Inventors; Notices of Recent Patents, 115.

"TEN MILLION DOLLARS is lying unused in a single Denver bank." So says a Denver paper. 'Tis unfortunate that there should be idle men and idle money, each only needing the co-operation of the other. The circumstance illustrates that the increase in the production of gold is no assurance of an increase of money in circulation, or of money at all, for that matter. The mining of gold is simply the production of a commodity, just the same as the production of anything else. It will continue just as long as there is a market for it; and, whether it will go into the arts, in watch cases, chains and gold-bowed eyeglasses, or into gold dollars and pounds sterling, will depend entirely upon the demand for those things. Money gets into circulation through the demands of business, not through the production of gold. It is the revival of business that will set money in circulation, not the minting of money that will create this business prosperity.

IT is a common impression abroad that few California mines pay dividends because little public notice is made thereof. The fact is that, unlike other places, there are comparatively few incorporated mines, the bulk of them being private partnerships or individual enterprises, and, like any other private business, the annual net sum realized after paying expenses is a dividend. There are thousands of such dividend-paying mines in California. As a matter of fact, the best paying properties in the State are among the least heard of. This doesn't do much to advertise the State's mining resources, but it always was the custom and probably always will be. Last week the writer of this paragraph asked the principal owner of a mine that has been a steady monthly dividend payer for many years: "Is the Golden Lyre still productive? I haven't heard of any dividend in the last three months." "Bigger and better than ever," was the reply, "but Wells-Fargo's agent has particularly requested that no news be given out of our dividends any more—road agents, you know." Some States advertise the fact that paying gold mines are being worked therein. California carefully conceals the fact wherever practicable.

Klondycitis and Alaskamania.

The most senseless rush in the history of gold mining is now being made to the borders of Alaska and the British Northwest Territory. Inflamed by the receipt here of a few thousand ounces of gold of less aggregate value than the annual product of one California county, there has been for the last two weeks a frantic effort on the part of thousands to get away. All sorts of crazy projects are started up, and in addition to the men who have gone on regular and irregular steamers, there is a general furbishing up of everything in the way of sail or steam craft in this port for the conveyance of thousands of others. Some of the projects are suicidal; some of the advertisements murderous in effect. It is gravely promised by advertisers in the daily papers that men will be taken to Dawson City and supplied with one year's provisions for $200—$150—$125. Those who have temporarily lost their heads accept these announcements.

Last week this paper gave due warning regarding this matter—a warning unnecessary to nine-tenths of our readers but of value to many unacquainted with the danger of the trip and wholly ignorant of where they propose going, the unusual risk attending the journey, or the extreme uncertainty of success.

Granting that everything said and sung about the Yukon gold fields is so, it must be considered that there is a speedy limit to available ground; all in Circle City and adjacent thereto have rushed in; letters received at this office from Alaska mining companies say there is a general hegira from other Alaska mining districts; in addition have already gone from northern ports—Seattle, Tacoma, Portland, etc., all who could. What possible chance, then, can the California contingent have, and what remote show is there for those who yet contemplate going?

The cause of the present excitement is evident. Prevalent hard times have much to do with it. Then, in no part of the world is it easier to create a stampede. Such seed falls on fertile ground in California. There was a rush to the Humboldt county beaches in 1851, to eastern Peru in '54, to Kern river in '55, a hegira to Fraser river in '58. Between April 20th and August 9th of that year, as given in "Prices Current," there sailed from San Francisco 23,488, and as many more would have gone but for the adverse reports the returning miners brought. In '59 came the Washoe excitement, and again in '63 and later years came renewed rushes to far-off regions, all ending, mostly, in bitter disappointment. Throughout these years California, as to-day, was best of all. No matter how wild the story, or great the yield, the every-day record of the State as a gold producer equaled the story elsewhere. At Carson Hill, Calaveras county, in '54 was found a 195-pound lump of gold; on August 18, 1860, at the Monumental mine, Sierra county, was unearthed a 133-pound mass of gold and quartz, sold to R. B. Woodward of San Francisco for $21,635.52; from the same mine in '69 was produced another mass weighing ninety-five pounds; in 1871, on Kanaka creek, Sierra county, a 98-pound chunk was found and at Rattlesnake creek, Sierra county, the same year was found one weighing 106 pounds. Duplicate statements can truthfully be made concerning Nevada, Tuolumne, Placer, El Dorado, Trinity, Shasta and other California counties, and throughout the nearly fifty years since gold was first discovered here is the glittering record. Last year six locations in Amador county yielded $1,074,000; twelve mines in Nevada county produced $1,266,000; ten others in Tuolumne, Calaveras and Shasta, $2,707,000. Over twelve thousand million dollars in gold has been authentically ascertained to have been produced by this State, not counting the untold millions of which no record was ever kept.

The knowledge of such great gold finds in this State adds to the willingness to believe the probability of their recurrence in the far north, and thousands who in these dull years have found it difficult to win even a competence are eager to be first in a field where the old days of '49 seem likely to be duplicated. The rigors of that region must be considered, and every possible precaution taken against disaster.

The Klondyke discovery unquestionably is but the first of many rich strikes that will be made in the Yukon basin, both in Alaska and in Canada. It is, indeed, within the possibilities that the annual gold yield of the country will equal that of the early California and Australian days. Yet gold is not to be picked up there indifferently by the expert and inexpert. Men cannot go there with no capital but their physical strength and secure gold as it was secured by the same class of men in California and Australia. The Klondyke itself is a small branch of the Yukon river, and contains an area of placer ground which, though rich, is far too small for the thousands that are traveling toward it. They must strike out and explore for new placers. In this the extravagant theories that have been advanced to account for the presence of the gold are a distinct impediment to successful exploration, and should be discarded. The country is too difficult, the climate too severe, and the value of time there too great, for the expenditure of the enormous energy which has covered other gold mining districts with mining works in places where commercial gold values were demonstrably impossible with or without the costly but useless works. There is no occasion for this expenditure of time, money, and even life itself, in this kind of waste work in the Yukon gold fields. The deductions and experience resulting from the failures and successes of the mining of the last half century in California and elsewhere are a safe guide to the avoidance of avoidable failures. Making intelligent use of this fund of available knowledge, the proportion of successes should be large.

The conditions in the Yukon would seem to indicate organized co-operative work of large companies as likely in the long run to produce a greater average of successes than possible by individual mining. Not only is it possible to cover more ground in prospecting by organized co-operation, but the economy of exploitation can be very much increased by working several claims together as one.

In conclusion, it is suggested that any one contemplating departure should weigh well the situation, take all obtainable facts; should not create an atmosphere in which to flap the wings of fancy, but consider is he fitted for the adventure; can he see it through, and, after all, is he not better off in this favored clime than he possibly could be even with gold amid the terrors of that region?

We would not be understood as decrying Alaska. There is gold there, plenty of it, and the country will be a good one for the adventurous for years to come. But to go there from here this season is unwise. A good many poor fellows will suffer, starve and die. Later on those things will be better understood.

THE lowest price in the history of silver was reached for that metal this week, due, it is said, to heavy sales for American account. From the 17th to the 22nd inst. were shipped from New York to Europe 1,497,000 ounces; to the 9th and 16th, 2,478,000 ounces, making a total of 3,975,000 ounces for the first three weeks of this month. On the 26th inst., New York government assay bars were quoted at 59 cents, which made the silver in a standard silver dollar worth 45.63 cents, as against 45.70 cents in 1894. The London quotation on the 28th for fine silver was 26⅜ pence; during March, 1894, it touched 27. The New York price that day was 57⅜ cents for pure silver. On the 29th it steadied a little, being 57½ in New York and 26 7-16 in London. It is believed that the bottom has been reached, and that silver will now gradually appreciate in value.

THE announcement elsewhere of the sixth annual convention of the California Miners' Association is of more than ordinary interest to the mining industry of this State. The five successive annual deliberations of that organization have been of value. The meeting next October will not be second in importance to any of its predecessors. It is none too soon for the several county organizations to discuss the selection of delegates, the measures to be acted upon and the policy to be pursued. The association has made very few mistakes, has been fortunate in its administration and uniformly successful, and has the confidence of the commonwealth. Considerable valuable work has been done by its committees during the year and a good deal comes up for consideration at the coming meeting.

Concentrates.

AUSTRALIA is shipping gold to the United States.

THE field work of the State Mining Bureau has ceased.

THE Clark road law has been declared unconstitutional.

THE June gold export from the Cape, South Africa, was £985,728.

A LARGE amount of annual assessment work has been done this month.

THE mineral production of Montana for 1896 aggregated in value $50,732,099.13.

THE Copper Queen mine at Bisbee, Arizona, is now producing 1000 tons per month.

"EVERYTHING is cheaper these times" except gold and transportation to Alaska.

DAWSON CITY, ALASKA, has a newspaper, the Yukon *Nugget*, Scott & Carr, publishers.

THE June production of copper in this country was the largest on record—19,658 tons.

BRITISH COLUMBIA has sent its first consignment of copper matte to Swansea, Wales.

THIS paper is weekly seen by nearly every mining man in this west half of America.

A STRIKE of cinnabar is reported by J. C. Henry at Walnut Grove, Yavapai county, Arizona.

THE Le Roi Mining Company has decided to locate the company's smelter at Northport, Wash.

SIX gold-washing machines are expected to be in operation at Olinghouse, Nevada, within two weeks.

ON the 3rd prox. Australia will send $1,000,000 gold to San Francisco, the first consignment of the kind.

THE gold miner continues to be the only one sure of a market for his entire production at the highest price.

IT is calculated that the net earnings of the Boston and Montana Copper Co. this year will be $2,500,000.

COLORADO papers again declare that this year, sure, that State's gold yield will exceed that of California.

IT is now three months since the lost "Blue Bucket" mine, in eastern Oregon, was rediscovered for the thirtieth time.

NEXT Saturday's issue of this paper will have an interesting article on the Yukon, written from a scientific standpoint.

BUT 163 ounces of platinum were produced in the United States—that is, in California—in '96. The commercial value was $944.

C. W. PAULY of San Diego, Cal., is the receiver of the Golden Cross mines, San Diego Co., at a compensation of $400 per month.

THE next annual convention of the California State Miners' Association will be held in this city, beginning Monday, October 18, 1897.

FROM the most authentic sources obtainable it is estimated that to January 1st, '97, Tuolumne Co., Cal., produced $215,000,000 gold.

LIKE all other parts of the world, the June product of the East Indian mines was 25% in excess of that of last year, being 32,008 ounces.

A WEST AUSTRALIAN assayer, who recently discovered telluride, argues that mustard gold is an infallible indication of telluride at greater depth.

THE sale is reported of the Golden Chest, Dora, Katie Burnett, Joe Dandy and Paymaster properties at Murray, Idaho, to G. V. Bryan for $300,000.

SOME of the newspaper correspondents who went to the Klondyke took carrier pigeons, on which they will depend for speedy transmission of news.

DURING the week three steamers have left this city loaded down with passengers for the Yukon. The craze continues and much suffering is inevitable.

THE exact value of a ton of gold is $602,927.23. When you sell a ton take nothing less for it. The gold coin of the United States is worth $18.605 per ounce.

A BILL has passed Congress creating the office of surveyor-general for Alaska at a salary of $2000. Two land districts will be immediately created there.

BRITISH COLUMBIA mining papers are urging the immediate appointment of an inspector of mines, which office was created by the recent legislative assembly.

"ALL the gold in the world could be put within the walls of a room 20 feet square." So could all the silver in the world were the ceiling sufficiently high.

THE French Government are sending two mining experts to British Columbia to investigate the reports circulated in France of the great resources of the Province.

THE nickel mines in Cottonwood canyon, Lovelock, Nevada, have resumed operations under the management of C. P. Turner, who has an electrical process to reduce the ore.

ABOUT as much is at present being put into gold mining in this State, in work, machinery and development, as is being taken out; the profitable outcome will be manifest later on.

ALL who go to Klonkyke are not crazy. Three newspaper men left last Wednesday on the Excelsior, who are paid $10,000 and their expenses. There is a method in their madness.

WELLS, FARGO & Co. will establish an express office in the Klondyke, Alaska district, at the earliest opportunity, charging $8.50 per $1000 for transportation of gold, including insurance.

THE assessment rolls show an increase in aggregate value in every mining county in this State and a decrease in some of the agricultural counties, a direct reversal of the facts in former years.

THE Sierra Co., Cal., supervisors refused B. A. Cardwell a franchise for a toll road from Meadow Lake to Sierra City, so he has determined to build it anyhow. Fifty men are at work constructing it.

SECTION 671 of the Civil Code of California, which took effect July 1, 1874, provides that "any person, whether citizen or alien, may take hold, and dispose of property, real or personal within this State.

IT is none too soon for the Government to begin getting ready the relief expedition that will be inevitably called for to succor the mutable many now crazily heading for the frozen swamps of the Yukon.

VERY little hydraulic or other mining machinery for Klondyke, Alaska, has so far been ordered from this city. The apparatus in use is of the crudest kind, and is likely to continue to be for some time.

AT the Golden Feather, Butte county, Cal., the manager says they have turned the river successfully, and it is all running through the canal. The claim is now practically drained, and he is preparing for sluicing.

THE work of running the boundary line between Idaho and Montana is under charge of E. T. Perkins Jr., who is now at Sand Point, Idaho; headquarters at Spokane, Wash. The work will be made by the U. S. Geologic Survey.

A TUNNEL nineteen miles long has been located, extending from Colorado City, Colo., to and four miles beyond Cripple Creek. The estimated cost is $9,000,000. The proposed tunnel is to be 8x8 feet and is to be driven 15 feet a day from each end.

E. E. MATTESON, who till quite recently was living in Grass Valley, Cal., is said to be the first person to use a canvas hose and nozzle in putting water on gravel claims, and is locally considered to have been "the inventor of hydraulic mining."

THE differences over the use of the water of Spring creek between the Garlick Electric Power Company and the Mountain Copper Company, Shasta Co., Cal., have been adjusted and several mines and mills which have been shut down will start up this week.

THE Alaska-Treadwell mine, on Douglass island, Alaska, paid its 33rd dividend, a $75,000 one, on the 28th inst. It originally cost $150. Nearly $1,000,000 has been spent developing the mine. The ore averages $8 per ton, the average cost of milling is $1.15 per ton.

IN the suit of a French syndicate against E. L. Giroux and P. Griffin for "salting" a mine the jury at Baker City, Or., returned a verdict in favor of the syndicate for $4000. Griffin made a written confession, in which the plot and modus operandi were detailed.

THE Geiser family, which developed and worked the Bonanza mine, near Baker City, Or., has sold it to J. M. Patterson of Pittsburg, G. Crawford of New York, N. P. Hayes of Philadelphia and J. S. Wallace of Denver for $750,000, $50,000 forfeit being paid to bind the bargain.

AT the Broken Hill Proprietary, Australia, 28,151 tons of ore were treated for the four weeks ending June 24th, and the output from the refinery was 406 ounces of gold, 629,435 ounces of silver, 1580 tons lead, 45 tons antimonial lead, the copper matte containing 39 tons copper and 43,486 ounces silver.

THE fifth annual report of the California Debris Commission shows that the commission since its organization has received 311 applications to mine and has granted 238 permits. The only serious accident during the year was the breaking of the Manzanita mine dam, when 130,000 yards of material escaped.

THE Canadian Government proposes to exact a royalty of 10 per cent on claims in the Yukon with a monthly output of $500 or less, and 20 per cent on any claim yielding above $500 annually. This, in addition to $15 registration fee and $100 annual assessment, and every alternate claim to be reserved by the Government.

ACCORDING to returning miners from Peru the Klondyke gold is but a small affair in comparison with the newly discovered gold fields in the States of Cuzco and Pima, in that country, where, it is gravely stated, "gold in a free state is being taken out by the ton." Several Peruvian towns are reported depopulated by the rush.

"WHY did you come back with a little $8000 pile, when you could have stayed and made so much more?" was asked a returned Klondyker this week. "I wanted to get something to eat, and was all broke up in health," was the answer. Just what the unsuccessful, sick and hungry men who couldn't come back are going to do, is another story.

THE Alaska gold find so far differs in two important respects. Ordinarily, when a discovery is made, there immediately pops up reminiuisances of alleged discoveries in the same place in '58 or '64, and the local papers say: "Meanwhile, let no one come expecting work." In this case those two incidents are not accompaniments.

WEST AUSTRALIAN gold exports during June,'97, aggregated 53,348 ounces, valued at £202,725, as compared with 59,111 ounces, valued at £224,624, exported in May. The gold export from Western Australia during the six months ended June 30 amounted to 265,314 ounces, against 114,324 ounces in the corresponding period of last year and 281,263 ounces for the whole of 1896.

MAJOR HEUER of the U. S. Corps of Engineers is detained in Cincinnati, O., and may not take up his official duties here before October, '97. The California Debris Commission, as at present constituted, consists of Col. Chas. R. Suter, Major C. E. L. B. Davis and Lieut. Herbert Deakyne, at Room 59, 809 Market St., San Francisco. Lieut. Deakyne is practically in charge of the work of the Commission.

THE extensive mica beds near Tres Piedras, Taos county, New Mexico, will be worked by a Chicago stove company. The mica district covers about 3000 acres and was discovered six years ago by Col. J. H. Cribben of Chicago. Mica in commercial quantities is a scarce article, the whole United States product of 1896 being worth but $57,041. In 1887, 70,000 pounds were produced in this county worth $142,500.

A BILL recently passed the French Legislature putting duties on lead ore, and lead in pigs, bars and sheets to the amount of 30 cents per 100 pounds. The usual consumption of lead in France is 80,000 tons, while the home product only amounts to 9000 tons. Mining engineers claim that, with higher duties, the home product might be increased to 33,000 tons. Others, however, claim that the valuable mines are worked out, and that out of 184 patents only 28 are or could be worked at a profit.

THE management of the Quincy Mining Co. has under consideration the building of an electrolytic smelting plant at Houghton, Mich. The Quincy ore, as is generally understood, is very rich in silver, running sixty ounces to the ton of copper ore. Under the present system of ore treatment a very large percentage of this silver is practically lost. Under the electrolytic process this silver would be separated from the copper and in consequence the earnings of the company would be materially increased.

OVER $80,000 was taken out of a little "pocket" last week—not in Klondyke, but near Sonora, Tuolumne county, California. There is no "rush" there, it is too close by; it is too steady and regular a circumstance; it is too easily reached; the climate is too fine; the fruit too luscious; the air too balmy; the sky too serene. Were that $80,000 to have been taken out in two and one-half days 4000 miles away in a frozen swamp in the shadow of night and the north pole, amid snow and ice and semi-starvation, there might be a "rush."

AN EXCHANGE after telling you you can get into a good, safe mining proposition at bedrock rates by the use of good, ordinary business judgment, adds: If you go in with them and want to succeed do not put an incubus around their neck by sending a sick relative, a lame uncle, a one-legged brother-in-law, some played-out life insurance agent, or a broken down song-and-dance man from the East to manage the mine. If you do your money is lost every time. First get a mine, then get a good practical miner, pay him a good salary and give him a sufficient fund to pay all bills promptly.

AS USUAL the MINING AND SCIENTIFIC PRESS was first with facts regarding the Klondyke mines, publishing the main point and a description of the manner of working, in the issue of March 20th, 1897, from a scientific miner on the spot. It is seldom this paper calls attention to these things, but in this regard it is also in order to note that in a great many instances it is not until after authentic accounts of matters in the mining and scientific world have been copied by Eastern papers from these columns that more adjacent contemporaries discover the facts and copy the copied accounts, usually crediting the Eastern publication with the statement that originally appeared herein.

A PRESCOTT, ARIZONA, *Courier* reporter asked a miner a few days ago for news about his mine. The miner replied that he did no newspaper mining, but worked in the ground; which is good, as far as it goes, but 100 men might work in the ground for ten generations and, were it not for the newspapers, no one outside of their immediate neighborhood would ever hear of it. They might have the best prospect on earth, but no purchasers would come and no outside investment would be at hand, because the outsiders would never hear of it, without the use of printers' ink to advertise the fact. Colorado owes its prominence in the mining field as much to newspaper advertising as to any other cause. Not to let the world know that you have a good prospect is to "hide your light under a bushel." The newspaper man expects no direct pay for publishing good news about the prospect; he expects to put money into circulation by attracting outside capital to buy that prospect and work it, and, if he can do this, everybody will prosper. If he is not allowed to do it, few prospects or mines will be sold, nobody will prosper. This is the whole thing in a nutshell.

THE Executive Committee of the California State Miners' Association met on the 23d inst. The committee appointed at the last previous meeting to confer with another committee from the Anti-Debris Association reported favorable progress. On motion the report was adopted and the committee instructed to continue on the same lines. The secretary read a communication on the same subject from the Sacramento Chamber of Commerce committee to that body, which was endorsed. On motion a committee was appointed to consider the subject of dredgers. The delegation to the Transmississippi Congress made a report, which appears in full on page 96. The time for the next annual convention was fixed—Monday, Oct. 18—and in connection therewith the secretary brought up the matter of money. Very little money had been received from the various county organizations. Last year Nevada county had paid in nearly $1400; this year, $250. Placer county last year $900; this year, $250. The Association is out of debt, but money is needed for current expenses. There is at present no salaried officer, but the coming convention requires provision for necessary expenses. It being represented that a mistaken idea appeared to prevail among some valley residents that the Association was willing to aid or connive at evasions of the law, in direct contradiction to the spirit and purpose of the Association, the following resolution was adopted: WHEREAS, An erroneous impression seems to have been created in certain quarters respecting the purposes and objects for which the California Miners' Association was organized; therefore, be it *Resolved*, That this committee calls especial attention to section 2 of article I of the constitution of the above Association, which sets forth the objects of the Association, as follows, to-wit: "Section 2. The objects of this Association shall be to protect, develop and foster the mining industry of California in all its branches." Further *Resolved*, That the California Miners' Association will in no manner aid or encourage any mining in violation of any law or the lawful decree of any court.

A STATE LAW which went into effect March 16, 1872, ordains that "it shall not be lawful for any corporation, association, owner or owners of any quartz mining claims within the State of California, where such corporation, association, owner or owners employ twelve men daily, to sink down into such mine or mines any perpendicular shaft or incline beyond a depth from the surface of 300 feet, without providing a second mode of egress from such mine by shaft or tunnel, to connect with the main shaft at a depth of not less than 100 feet from the surface. It shall be the duty of each corporation, association, owner or owners of any quartz mine or mines in this State, where it becomes necessary to work such mines beyond the depth of 300 feet, and where the number of men employed therein daily shall be twelve or more, to proceed to sink another shaft or construct a tunnel so as to connect with the main working shaft of such mine, as a mode of escape from underground accident or otherwise. And all corporations, associations, owner or owners of mines as aforesaid, working at a greater depth than 300 feet, not having any other mode of egress than from the main shaft, shall proceed, as herein provided. When any corporation, association, owner or owners of any quartz mine in this State shall fail to provide for the proper egress as herein contemplated, and where any accident shall occur, or any miner working therein shall be hurt or injured, and from such injury might have escaped if the second mode of egress had existed, such corporation, association, owner or owners of the mine where the injuries shall have occurred shall be liable to the person injured in all damages that may accrue by reason thereof; and an action at law in a court of competent jurisdiction may be maintained against the owner or owners of such mine, which owners shall be jointly or severally liable for such damages. And where death shall ensue from injuries received from any negligence on the part of the owners thereof, by reason of their failure to comply with any of the provisions of this act, the heirs or relatives of the deceased may commence an action for the recovery of such damages as are provided by an act entitled an act requiring compensation for causing death by wrongful act, neglect or default, approved April twenty-sixth, eighteen hundred and sixty-two."

Mines of the Gold Belt.

Written for the MINING AND SCIENTIFIC PRESS by W. H. STORMS, M.E.

The great gold belt in California extends from Kern county on the south to the Oregon State line, those mines lying south of the Tehachapi mountains not being considered as forming any portion of the main auriferous belt.

While those mines south of the Tehachapi may be contemporaneous in origin with those of the gold belt, they are separated from the latter by the Sierra Nevada mountains and are geologically distinctly different. Those great orographic movements, to which the fissures of the Sierra Nevada region may be attributed, evidently have nothing in common with those movements which have fissured, crushed and contorted the numerous mountain ranges which lie scattered about the southern counties of the State.

More particular consideration will be given those mines occurring in that portion of the gold belt lying in the counties of Madera, Mariposa, Tuolumne, Calaveras and Amador, including the great system of auriferous veins commonly known as the mother lode and also the prominent mines of the east lode.

The name "mother lode" was applied in early days to a line of prominent quartz outcrops beginning in the southern portion of Mariposa county and extending in a direction somewhat west of north through Mariposa, Tuolumne, Calaveras, Amador and El Dorado. The best paying mines, as a rule, are not those of large and prominent outcrop along this belt, but are found in either parallel fissures or in off-shoots from the main lode. The name "gold belt" seems much more appropriate and comprehensive than the term "mother lode," and in time doubtless the latter will become obsolete.

General Geology.—The general geological features of the gold belt have been repeatedly described by numerous writers, the most complete being "The Geology of the Mother Lode," by H. W. Fairbanks, in the tenth report of the State Mineralogist of California, and "The Geologic Atlas of the Gold Belt," by the United States Geological Survey.

Throughout the region of the gold belt we find, generally speaking, narrow strips of black slate, limestones, quartzites, mica schist, and other metamorphic rocks, associated with broad or narrow areas of basic rocks, mostly diabase, diorite and serpentine, and in the more southerly portion with granite. There are also many dikes of acid type, ashy-gray in color, and ranging in composition from diorite to micro-granite. Some are coarse-textured and others are felsitic. These latter often contain light greenish scales of chlorite, and probably represent a rock intermediate between diorite and felsite, or perhaps other rocks of micro-granitic type. This is not remarkable, when it is considered that the granite of the Sierra Nevada is nowhere known to be a *true* granite, but is as much entitled to be called diorite as granite. This complex composition has led to the name "grano-diorite," given by the United States Geological Survey. Our granite is made up of all the essential constituents of both granite and diorite.

In a general way the granite follows along the line of the gold belt, though at greatly varving distances. It is usually found in pretty close proximity to the east lode, and in Tuolumne county is the "country rock" of many of the leading mines near Carters and Soulsbyville. In the southern part of Tuolumne county and in Mariposa county large masses of grano-diorite are found between the east lode and mother lode, the gold-bearing veins of the former being inclosed in slate rocks of the Calaveras formation, and the latter in either the black slates of the Mariposa formation or in amphibotite schists, and frequently associated with serpentine.

In Mariposa county large granite masses extend several miles to the southwestward across the strike of the slates, but, contrary to the common belief, do not abruptly "cut off" all the slates and metamorphic rocks, for these latter extend in long, narrow strips between the granite masses far to the southeastward into Madera and Fresno counties, and, possibly, farther. When the metamorphic rocks do abut against granitic masses in Mariposa county, the evidence of contact metamorphism may be very plainly seen. The rocks are crushed, brecciated and are often found contorted to the westward, appearing to have been thrust aside by the intrusion of the granite.

Near the line of Madera and Mariposa counties there are five belts of slaty, or schistose rocks, extending into the granite in a southeasterly direction. In the west, near the San Joaquin valley, is a belt of schists, slates and quartzites, intruded by many dikes, both basic and acid, reaching from the region about Hornitos, through the Buchanan copper mines and beyond. This belt varies from twelve miles in width at the north to three or four miles at the south. Its western and northern boundaries, as far as exposed, are the quarternary deposits of the San Joaquin valley. Eastward a granite area eight to twelve miles in width separates this west slate belt from a second slaty strip, which extends from four miles east of the town of Mariposa, near Big Spring, southeastward through Grub Gulch, Coarse Gold and the vicinity of Hildrethville, in Madera county. The eastern border of this schistose strip is much disturbed, slates and schists being inter-stratified with granite dikes, diabase, etc.

These granite dikes appear to unite in a solid mass northward, and a long tongue of granite extends several miles toward Mount Bullion. Still farther east a third area of schists extends from the region about Snow creek and Buckingham mountain, in Mariposa county, southward through Potter Ridge district, in Madera county. This strip is usually narrow—a mile or thereabouts in width—and on Potter ridge is bounded on the west by diabase. East of this the granite again separates the schists from another metamorphic area consisting of black slates, phthanites, quartzite and limestone (Calaveras formation of the United States Geological Survey). These rocks are much disturbed, crushed and contorted. On the east side of the middle fork of the Merced river, near the Hite mine, a great lens of granite, a mile in length and half a mile in width, appears to be entirely surrounded by slates and schists. Lying eastward from this region is an area of granite and highly metamorphic rocks, the relations of which could only be made clear by a geological map.

The interesting feature of these long arms of metamorphic rocks, which extend southeastward into the granite, lies in the fact that in each of them are found gold-bearing quartz veins, some of which have produced large amounts of gold, and others, undeveloped, give promise of yielding handsomely.

Madera County.—The so-called mother lode does not extend into Madera county, but the gold belt does. Quite a number of writers have declared that the mother lode extends through Grub Gulch, Coarse Gold, etc., but this is not the case. The mines of these camps and those on Potter Ridge are as distinctly different from anything on the mother lode as possible. In the Grub Gulch, Potter Ridge and Coarse Gold regions there are two distinct types of veins. There are fissure veins which occur in granite, and also in slate or schistose magnesian rocks, and when in these latter have a strike and dip across the inclosing rocks. These veins usually have well-defined walls; are narrow, seldom exceeding 24 inches, and frequently carry a high-grade sulphide of iron, sometimes associated with arsenic; sulphides of lead, zinc and copper also occur. Much of the quartz is crystallized; calcite is of frequent occurence and not infrequently small greenish scales of a magnesian mineral occur, much resembling the Mariposite of the mother lode; and, by the way, the occurrence of Mariposite is the only thing, either mineralogical or geological, in which the mines of Madera resemble those of the mother lode. Among the mines of this type may be mentioned the Gambetta, at Grub Gulch, carrying a good grade of ore, and having the peculiar features above described.* The Bullion mine, at Grub Gulch, is also of this type, but differs from the Gambetta in occurring in schistose magnesian rocks which have an easterly dip. The vein conforms with the schists in strike, but dips westward, the angle of intersection being about 90°. Some of the quartz in this little vein is high grade and some of it worthless. The Lillie mine, about two miles east of O'Neal's, is also of this type and occurs in granite. It has been worked with profit to a depth of 400 feet.

Most of the mines of Madera county differ from those just described and form the second type of veins referred to. These occur in fine-grained mica slate; conform nearly with the slates in both strike and dip and are often found associated with granitic dikes. The quartz occurs as an infiltration, saturating the slates and sometimes forming solid masses of quartz, but usually the slaty structure of the original rock may be very plainly seen. The shoots occur in a series of lenses, sometimes following one another in a straight line. In this case one wall is often found well defined, the fissure evidently being one of displacement as well as of fracture. More commonly, however, the quartz lenses, while following a general trend, lie at an angle, the ends sometimes overlapping. Again, several lenses of varying sizes are found in a zone several feet wide, and not only the quartz but the slaty material of the zone are mined and sent to mill. Of this type of mines there are a great many examples. Among them are the mines of the Savannah group; the Starlight, on the same lode, the Fresno Enterprise, and nearly all the mines about Coarse Gold.

Mining operations in Madera county are not in a very flourishing condition and have not been for a long time. Still, I believe that there are a number of mines in that county in the prospective stage of development which will pay if carefully operated in the proper manner. Some of the gold-bearing zones are wide, and, though of low grade, are free milling, and with favorable conditions as to water, wood, etc., should pay well.

There are two large streams in this county and a number of small ones which will furnish abundant power, and both compressed air and electrical plants could be installed here to advantage. The section has been the field of some of the most unfortunate and ill-advised investments, but these facts need not and do not diminish the actual value of the mines.

Never having visited the mines of Fresno, Tulare or Kern counties, I can make no particular mention of any of them, but from such information of an authentic character as I have been able to obtain, they differ in no important particular from those above described.

Soulsbyville, Cal., July 17, '97.

Transmississippi Congress.

At a meeting of the Executive Committee of the California Miners' Association, held in this city on the 23rd inst., the following report of the delegates from that body to the recent Transmississippi Congress at Salt Lake City, Utah, was made by Tirey L. Ford, and on motion was adopted and the delegation thanked for their action:

To the Chairman, Officers and Members of the Executive Committee of the California Miners' Association.—GENTLEMEN: The undersigned, delegates to the recent session of the Transmississippi Congress held at Salt Lake City, Utah, appointed by authority of your honorable body, beg leave to submit the following report:

In obedience to your instructions, your representatives succeeded in securing the endorsement by the Transmississippi Congress of the proposition to establish a new executive department to be known as the Department of Mines and Mining, with a secretary thereof who should be a member of the President's Cabinet. The resolution embodying this endorsement was drafted by your representatives, and after its presentation by one of your representatives was unanimously endorsed by the Congress.

The Congress further authorized the appointment of a committee of five to urge the necessary legislation upon the Congress of the United States. The president of the Congress appointed the following delegates upon such committee: Ford of California, chairman; Patterson of Colorado, Richards of Idaho, Lawrence of Utah and Dorsey of Nebraska. This committee was authorized to consult with a similar committee of five appointed by the recent Gold Miners' Convention held at Denver, Colorado.

Your representatives further succeeded in securing the endorsement of the following resolution, to wit:

Resolved, That this Congress earnestly requests the Congress of the United States to make additional appropriations for the construction of restraining barriers for the protection of the Sacramento and Feather rivers in California in manner as set forth in The River and Harbor Act of 1896; and further

Resolved, That the Congress of the United States be earnestly requested to make an appropriation of not less than five hundred thousand dollars for the purpose of dredging and otherwise improving the Sacramento and Feather rivers, which work is imperatively needed and cannot with safety be longer delayed.

Your representatives further secured the endorsement of a resolution requesting the Congress of the United States to thoroughly examine and revise the Federal mining laws. This action your representatives deemed advisable in view of the effort now being made by the California Miners' Association to secure a revision of the Federal mining laws.

At the request of your representatives the Congress also urgently requested the Commissioner of the General Land Office to reverse the ruling of his predecessor in relation to the character of land containing petroleum and other mineral oils, the request of the Transmississippi Congress being that the Commissioner of the General Land Office should delare that petroleum and other mineral oils should be declared minerals and that the land containing them should be declared mineral land, and that such lands should be open to location as other placer mining ground and, furthermore, should be excepted from railroad grants the same as other mineral lands.

Your representatives further secured a request from the Transmississippi Congress that the Federal mining laws should be so amended as to include within the list of minerals embraced within such laws petroleum and other mineral oils, all hydrocarbons, slates, building stones and other minerals.

Your representatives are unable to present with this report a complete list of the minerals included in the above reference, owing to the loss of the original copy of the resolution introduced in that behalf by Delegate Keyes of California. The official proceedings of the Congress, however, which will soon be published, will contain complete copies of all the foregoing resolutions.

In conclusion, your representatives beg leave to say that the thanks of the California Miners' Association are due to the entire California delegation to the Transmississippi Congress, consisting of twenty-six members, for their unanimous and ardent support of the matters urged by your representatives.

Respectfully submitted,

W. S. KEYES, per T. L. F.
DAN T. COLE.
TIREY L. FORD.

Delegates from the California Miners' Association to the Transmississippi Congress at its session held at Salt Lake City, Utah, July 14, 15, 16 and 17, 1897.

The New Labor Law.

In response to sundry requests herewith is published the new labor law passed at the last session of the California Legislature:

SECTION 1. Every corporation doing business in this State shall pay, at least once a month, each and every employe employed by such corporation, in transacting or carrying on its business, or in the performance of labor for it, the wages earned by such employe during the preceding month: *Provided, however*, that if at the time of payment any employe shall be absent, or not engaged in his usual employment, he shall be entitled to said payment at any time thereafter upon demand.

SEC. 2. A violation of any of the provisions of Section 1 of this Act shall entitle each of the said employes to a lien on all the property of said corporation for the amount of their wages, which lien shall take preference over all other liens, except duly recorded mortgages or deeds of trust; and in any action to recover the amount of such wages, or to enforce said lien, the plaintiff shall be entitled to a reasonable attorney's fee, to be fixed by the court, and which shall form part of the judgment in said action, and shall also be entitled to an attachment against said property. An unrecorded deed shall be no defense to such actions.

SEC. 3. That on the trial of any action against such corporation for a violation of the provisions of this Act, such corporations shall not be allowed to set up any defense for a failure to pay monthly any employe engaged in transacting or carrying on its business the wages earned by such employe during the preceding month, other than the fact that such wages were not earned, except a valid assignment of such wages, a set-off or counter claim against the same, or the absence of such employe from his usual employment at the time of the payment of the wages so earned by him.

SEC. 4. No assignment of future wages, payable monthly under the provisions of this Act, shall be made to the corporation from which such wages are or may become due, to any person, on behalf of such corporation, for the purpose of evading the provisions of this act, and all such assignments are hereby declared to be invalid.

SEC. 5. No corporation shall require, and no employe of such corporation shall make, any agreement to accept wages at longer periods than as provided in this Act as a condition of employment.

SEC. 6. All wages earned by any employe engaged in the service of any corporation in this State shall be paid in lawful moneys of the United States, or in checks negotiable at face value on demand.

SEC. 7. Any corporation violating any of the provisions of this Act shall be subject to a fine not exceeding one hundred dollars, or less than fifty dollars, for each violation, the same to be imposed by any court in this State having jurisdiction of offenses in which the penalty does not exceed a fine of one hundred dollars; said fine to be paid, by the judge or magistrate before whom a recovery may be had under the provisions of this Act, into the general fund of the treasury of the county in which said conviction may be had.

SEC. 8. This Act shall take effect and be in force from and after the first day of April, eighteen hundred and ninety-seven.

Approved March 29, 1897.

On July 2, 1897, the Superior Court of Mendocino county sustained the constitutionality of the above.

Report of the De Lamar, Idaho, Mining Co.

The following data is given as to the cost of mining and milling at the De Lamar mine, in Idaho, in the annual report made by Mr. Dwight B. Huntley to the company. The total cost was $11.14 per ton, but in this must be taken into account the fact that at the mine wood is $9 per cord, mining timber 18 cents per foot, lagging (5 feet long) 9½ cents each, and freight hauled fifty miles by wagon and pack animals.

Mr. Huntley assumed charge in October, '96. The report is for the year ending March 31st, '97.

The following are results of milling operations:

Mill in service (40-stamp basis)	290 days 4 hours.
Wet tons crushed	44,948 tons.
Dry tons crushed	40,453 tons.
Assay value of ore:—Gold, 0.7035 ozs. @ $20 = $14.07	
Silver, 7.8615 ozs. @ 65c = 5.11	
	$19.18.
Percentage saved according to assay	72.16%.
" " " bullion returns	71.35%.
Number of ounces pure gold produced	18,557.906 ozs.
" " " silver "	276,026.28 ozs.
Total value of gold and silver	£117,035 19s 2d.

Of shipping ores sent direct to the smelters there were produced 115.553 tons, yielding $43,101.57, or $373 per ton, of the value of £9104 18s 10d. The total product of the mine was thus £126,140 18s, obtained at a cost of £92,629 5s 1d. The cost per ton of obtaining the above results, including development work and all expenses, was $11.14, as compared with $11.64 the preceding year. Included in the foregoing is the cost of obtaining the shipping ore, viz., $23,757.59, or 59 cents per ton on the total production. The average price obtained for silver was 65.85 cents, compared with 66.53 cents the previous year. The ores treated have yielded 18,558 ounces gold and 276,026 ounces silver; of the total value recovered the gold represents 67.75 per cent and the silver 32.25 per cent, against 63.61 and 36.39 per cent last year. The mill ran during the year on a 40-stamp basis 290 days 4 hours, and the ore crushed per stamp per day was 3.48 dry tons. The production of shipping ore was 115 tons, averaging $373 per ton, compared with 193.807 tons, averaging $468.31 per ton, last year. As has been frequently pointed out would be the case, the supplies of this ore obtainable in the present known ground have been on a steadily diminishing scale. In the early part of the year a strike occurred among the miners and laborers for higher wages, which was granted after a stoppage for about five weeks. In February last wages were again reduced to the old terms, as regards miners. The additional cost to the company in wages alone, while the advance lasted, was about $13,000, besides the labor incurred in effecting necessary mine repairs when working was resumed. Mr. Huntley discusses fully the question of milling ore reserves, which he estimates at 9350 tons first-class and 101,500 tons second-class ore. Progress has been made with the Pelatan-Clerici installation. The large oblong tank first erected having failed, the General Gold Extracting Company was allowed to erect small circular tanks, which on a ten-ton scale have proved quite successful, and are now being completed to a capacity of fifty tons as originally proposed. The costs in connection with the failure of the oblong tank are being borne by the General Gold Extracting Company out of accruing royalties. The board are daily expecting advice of the completion of the whole plant. [This plant was completed June 1st, '97.—ED. M. & S. P.]

Mr. Huntley continues: The De Lamar mines have contained large, rich and continuous ore bodies, extending from near the surface to about the tenth level; then a barren zone has been encountered, although the veins continue of good size and seemingly identical in general characteristics with those parts nearer the surface. This condition is not an uncommon occurrence at other mines. That the ore in a vein does not occur in one body is the rule rather than the exception in most mines. Hence I believe it reasonable to expect that we shall find other ore bodies with deeper development. I cannot see into the earth, and, with present knowledge, will not prophesy either of large, new ore bodies or of barren areas beyond the present workings. But I believe it good mining policy to continue prospecting in your claims for considerable distances, both in depth and laterally, from the present openings which have yielded so largely.

Shipping Ore Reserves.—The known bodies of shipping ore in the parts of the mine known as the "silver stopes" are exhausted; still, we may expect to find from time to time bunches of this ore which will more than pay the expense of the few men now employed in this department.

MILLING DEPARTMENT—TABLE OF RESULTS FOR THE YEAR.

Number of wet tons crushed	44,948.23 tons.
" dry " "	40,453.41 tons.
Average assay value of ore milled:—	
Gold, 0.7035 ozs. @ $20 = $14.07	
Silver, 7.8615 ozs @ 65c = 5.11	
	$19.18.
Percentage saved according to assay	72.16%
" " " bullion returns	71.35%
Number of Dore bars produced	164 bars.
" ozs. pure gold produced as per bullion returns	18,557.906 ozs.
" ozs. pure silver produced as per bullion returns	276,026.28 ozs.
Value of the gold (realized at $20.67 per oz.)	$382,284.70
" silver (realized at $0.6585 per oz.)	181,770 39
Add for residues, etc., realized	5,364.13
	$569,419.22

This includes the ore worked by the Pelatan-Clerici process and the bullion obtained therefrom.

Mill was in operation during the year (40-stamp basis)	290 days 4 hours.
(Time lost during the strike, 42 days)	
Ore crushed per stamp per day	3.48 dry tons.

COST OF OPERATION.

The average mining cost, for the year, including its proportion of departmental charges and incidental expense, the costs in the prospecting department, and all mine labor and supply expense, has amounted to	$ 5.30	per dry ton.
A further sum of	0.59	" " "
must be added to the above as the cost of mining and marketing shipping ore.		
The average milling cost for the year, including its proportion of departmental charges, etc., labor, supplies, repairs, and all other mill expense has amounted to	4.49	" " "
The cost of extraneous expenses, etc., the large items of which are:—		
Taxes	$3,500	
Insurance	5,000	
F. Haggerty—Compromise of suit for damages by man injured in mine	2,500	
Annual assessment work on claims	1,000	
has amounted to	0.76	" " "
Total cost	$11.14	" " "

This is a reduction of $0.50 per ton on last year, and had it not been for the strike a very much larger decrease in cost would be shown.

SUMMARY.

	Dry Tons.	Gross Product.
Shipping ore department	115.553	$ 43,101.57
Milling department	40,453.410	569,419.22
Miscellaneous revenue	.....	3,205.05
Grand total	40,568.963	$615,725.84
Yield per dry ton		$15.17
Cost " " "		11 14
Average profit per dry ton		$ 4.03

Milling Ore Reserves.—In a report, November 20th, 1896, upon the condition of the property, I gave a full statement of the workings and the ore reserves of the several veins. That report is so recent it is not necessary to repeat its details here. I estimate the following as approximately the tonnage of the reserves on March 31st, 1897:

	1st Class Tons.	2nd Class Tons.
Wilson and Hamilton veins	3,600	15,000
77-foot vein	5,500	79,000
Other veins	250	1,500
2nd class ore dumps (estimated value at $9 per ton)	....	6,000
Totals	9,350	101,500

The first-class ore is that valued above $14 per ton; the second-class ore is that valued between $14 and $4, and will probably average $5 per ton. These are wet tons, and contain about 10 per cent moisture. For the above values gold is counted at $20 and silver at 65 cents per ounce. As considerable of the second-class ore will assay $6 to $9 per ton, with occasional bunches of even high grade, a part of the second-class ore can be counted at a higher average value than before stated. But the tonnage of that part would be only a small proportion (possibly ⅓, ¼, or ⅕) of the total amount. It is not possible at the present time to give the second-class values and tonnage more closely than as above. In my opinion, with the present local conditions and processes the lower grades of the second-class ores cannot now be profitably worked. But it has been the experience of most Western mining camps that if large bodies of ore exist—even though low grade—somehow, after a time of idleness or of experiment, the prices and processes become adjusted to the ore, and a small profit is realized. This will probably be true also at De Lamar. To sum up, the present conditions show that the milling department has worked the first-class ore faster than the prospecting department has developed it.

Tailings.—The company also own 50,000 to 70,000 tons of tailings, assaying $5 to $7.50 per ton, which are stored in a reservoir about two miles below the mill. These can be reworked at a profit, but neither the process nor the means of transportation have yet been decided upon.

ANALYSIS OF COSTS PER TON OF ORE TREATED IN THE MILL FOR THE YEAR ENDING MARCH 31, 1897.

Labor.	Amount.	Per Ton, Dry. Cents.
Superintendence and foremen	$10,056.25	24.86
Crushermen	3,440.01	08.51
Batterymen	3,930.80	09.72
Tankmen	7,774.55	19.22
Panmen	5,253.00	12.98
Pan helpers	4,614.74	11.41
Repairmen	2,231.85	05.52
Retortmen	1,348.00	03.33
Engineers	2,835.00	07.01
Firemen	1,955.27	04.83
Machinists	3,571.43	08.83
Blacksmiths	1,330.00	03.29
Watchmen	3,886.06	09 56
Carpenters	3,396.37	08.39
General labor	2,840.37	07.02
Wood and teams	2,455.90	06.07
Oiler and iron scraper	799.20	01.97
Assayer, proportion	1,839.50	04.05
Storekeeper, "	1,527.25	03.78
Office expenses, "	2,123.96	05.25
Incidental expenses, "	613.53	01.51
Total, as per revenue account	$67,603.04	$1.67.11

Supplies.	Amount.	Per Ton, Dry. Cents.
Chemicals	$ 8,109.67	20.05
Lubricants	452.16	01.12
Illuminants	299.28	00.74
Fittings	148.62	00.35
Castings	9,805.94	24.24
Iron and steel	125 60	00.31
Lumber	808.32	01.99
Coal and Charcoal	1,559.19	03.85
Belting	505 93	01.25
Quicksilver	29,030 34	71.76
Salt	4,912.50	12.14
Fuel	39,930.68	98.71
Bolts and nuts	92.88	00.23
Tools	145.56	00.36
Pipe	59.72	00.15
Sundries	3.773.78	09.33
Assay office supplies, proportion	955.85	02.36
Stable supplies, "	1.501.14	03.72
Office and incidentals, "	672 93	01 66
Freight and expressage, "	9,525.00	23.54
Stationery and printing, "	196 63	00.48
Telegrams and postages, "	633 42	01.57
Legal expenses, "	927.08	02.30
Total, as per revenue account	$114,167.22	$2 82 21
Insurance, proportion	4.380.00	10 83
Extraneous expenses, "	6,594.36	16.30
Freight and charges on bullion, "	7,272.85	17.98
Total	$132,414.43	$3.27.32
Labor		$1.67.11
Supplies		2.82.21
Total mill cost, as per revenue account		$4.49.42
Sundries		0.45.09
Total cost per ton		$4.94.41

Ingenious Signal Bell Arrangement.

TO THE EDITOR:—At the Magalia drift mine, Butte county, considerable difficulty was experienced in making the underground signal bell work successfully. This bell consisted of the ordinary steel triangle, operated by a bell cord or iron wire running through the tortuous gangways of the mine, and worked satisfactorily for about a thousand feet. As the distance increased and the curves became more numerous, the friction made it difficult to give the proper signals.

Recently an 8-inch electro-mechanical gong was put in and works very satisfactorily. The gong strikes one for each contact and will give 300 or 400

blows before it is necessary to rewind it. The metallic circuit is complete, about 2600 feet long, and made of No. 12 Habershaw rubber-covered wire. As the mine is very wet, particular attention was paid to the insulation. The ordinary porcelain knobs, attached to the timbers by screws, are used for insulators.

At present a battery consisting of four Hercules cells is amply sufficient and is arranged in a dry place near the underground hoist. An ordinary push button, placed in a waterproof case near the face of the mine, closes the circuit. A. D. Y.

Magalia, Cal., July 25, '97.

Treatment of Low-Grade Ores by Concentration.

The above is the title of a paper read by E. B. Kirby of Denver, Colo., at the recent meeting of the International Gold Mining Convention in that city. The following is a condensation of the article:

It is well understood that most ores of the precious metals are composed of rock with mineral crystals distributed through it. Those minerals present in any particular ore may comprise one of several out of a large list. As a matter of fact, there are four which are so common and prevail so universally in mining districts that few mills have to deal with any others. These minerals named in order of frequency with which they occur are pyrite (iron sulphide), blende (zinc sulphide), galena (lead sulphide), and chalcopyrite (copper and iron sulphide). Each of these minerals may contain both gold and silver, but pyrite and chalcopyrite are the common carriers of gold, while galena and blende have a special affinity for silver. It is also well known that in unoxidized or sulphide ores the gold and silver contents are not distributed uniformly through the mass, but are generally confined to these mineral crystals. By crushing the ore and separating out the valuable crystals from the waste material or gangue its value is concentrated into their small bulk. This will bear the expense of shipping and smelting, or of treatment by the more expensive processes.

Concentration milling is, therefore, the most important of all processes applied to low-grade gold and silver ores. It is of the same fundamental importance here as in the field of simple lead, copper and zinc ores. It is of more general application than any other process, and by one simple treatment, performed at the mine, it gets rid of the mass of valueless gangue. The cost ranges from 20 cents to $1.50 per ton, according to the capacity of the mill and the system employed. It is, therefore, the cheapest of all processes, with the single exception of free gold stamp amalgamation, which costs from 35 cents to $1.25 per ton and produces a product in the form of bullion which requires no further treatment. The more expensive processes of pan amalgamation, barrel chlorination, cyanide and smelting entail an expense per ton of ore which greatly exceeds that of concentration. The latter will always maintain its superiority in cheapness, and also in its range of application. The other processes find their special field in the treatment of concentrates, or of high-grade ore, or of ores which are of exceptional character, and do not yield their values to the simple operation of concentration, or free milling. The gold ores of Mercur, or of Cripple Creek, or the quartzite ores of the Black Hills, together with the oxidized lead and heavy sulphide ores of various districts, are illustrations of the latter class.

Before mining men it is unnecessary to dwell upon the extent of our resources in low-grade ores of gold and silver. All realize the opportunities they present for the future application of capital. The majority of these ores can be utilized only by concentration milling. As costs lower and extraction improves they will be gradually brought into use. But the extreme economies in mining and milling can only be secured by operating with modern skill upon a very large scale, and this requires a large capital. Hence, these resources are not waiting for the invention of some new and magic process. The process is already at hand. According to the skill and capital with which it is applied, it can now be made to yield almost any results within reason.

The more recent processes like barrel chlorination and cyanide, together with their various modifications, have developed so rapidly within a few years that they have attracted great attention. Much has been written and published about them, and the mining world is already well informed upon the latest methods, results and costs of each one. Concentration, although of more importance and more widely applied, has not progressed in such a startling way. The general mining public have, therefore, had less information upon its present development.

In crushing ore for the process, it must be broken fine enough to free the mineral crystals from the gangue. For most ores the size necessary for this purpose is quite small, so that the crushing unavoidably produces a large percentage of flour or slime. Moreover, this slime generally contains the richest minerals present in the ore, because these are more soft and pliable than the quartz. Slime requires the most elaborate and expensive machinery for its treatment. It has to be handled more slowly and is subject to heavier losses than grains of larger size. The problem always presented, therefore, is how to crush so as to liberate all the mineral, but at the same time to avoid a large slime production.

These objects are secured by making use of one or both of the two following methods:

1. The ore is subjected to an operation of part-crushing, which is repeated several times. After each operation the grains which are small enough are sifted out.

2. The ore is crushed to a size somewhat larger than that necessary to liberate all the included material, and the oversized grains are then subjected to a rough concentration on jigs. This takes out the liberated mineral and thus promptly withdraws most of the values from the danger of further crushing. The impoverished grains are then crushed again to the proper size and concentrated.

Each of these methods calls for a more complicated and expensive crushing plant. How far their advantages outweigh the cheapness and simplicity of crushing to the final size in a single operation, is always a question for calculation and experienced judgment. In general it is to be noted that American mills differ from those of Europe in showing a marked preference for the more simple plan.

The grains of the crushed mass range in size from the crushing limit of, say, one-quarter inch diameter down to microscopic flour. They possess two properties, and only two, upon which it is possible to operate. These properties are size and specific gravity. It is, therefore, necessary to operate first on one and then on the other. Strictly speaking, it is impossible to effect any separation by acting upon both at the same time. For instance, a grain of pyrites is heavier than quartz, if the two grains are of the same size, and it will therefore fall more quickly in water. But it is not heavier than a very large quartz grain, and, if two such unequal grains fall together, the quartz will fall more rapidly.

Hence, in order to make a separation, it is always necessary to perform two distinct operations in succession upon the crushed grains. The order adopted is not an essential matter, and concentration is therefore effected either by sizing and then sorting, or, on the other hand, by first sorting and then sizing. According to one plan, the grains are first divided into a number of different sizes. Each size is then subjected to the sorting effect of a fall in winter, which separates all the quick falling mineral grains from the slow falling rock. By the reverse method the grains are first sorted into a number of classes, each of which includes those grains which fall in water at the same velocity. It takes a large grain of the light quartz to fall at the same speed as a small grain of the heavy pyrites; so that in each equal falling class the quartz grains are all of larger size than the pyrites grains. The subsequent operation of sizing, performed on each class, separates the large grains from the small ones and completes the concentration.

These well known principles are simple enough and the two operations required do not seem difficult. Nevertheless, there is a great variety in the machinery and apparatus for performing each one. In practice the work of a concentrating mill is rarely confined to these two simple operations. It is complicated in various ways. If one operation is not done well, those which follow it suffer. Imperfect work, therefore, often makes it necessary to repeat the series. There is a large class of grains in which the crushing has failed to break the mineral from the rock. The grain, therefore, has an intermediate specific gravity and does not find its proper place. Other grains have peculiar shapes, which alter their rate of fall in water. Such middling products must be provided for and require special treatment. Most ores are more difficult than the simple case of quartz and pyrites. The differences in specific gravity are slight, or it may be necessary to separate several minerals not only from the gangue, but also from each other.

For the operation of sizing grains, screens are naturally employed whenever it is possible to use them. In practice screens do not work well on grains smaller than coarse sand. Inclined plane sizing machines are, therefore, used for all fine material.

Machines of this class have an inclined plane over which a very thin sheet or film of water is made to flow. This sheet of water is only one-twentieth of an inch thick and moves most rapidly at its upper surface. At the bottom, where it is in contact with the inclined plane, the water flows more slowly on account of friction. When grains of different size are treated the large grains, resting on the inclined plane, reach into the quick-moving part of the stream and are rolled down the slope. The small grains lying in the slow-moving region, close to the bottom, roll more slowly or not at all. The small grains which thus remain upon the inclined surface are either allowed to accumulate, as in hand or intermittent buddles of all kinds, or they are removed automatically by various methods. In one class of machines percussion or jerking movements are applied to the table. They cause the deposited grains to crawl out of the way and thus discharge themselves. In revolving buddle and belt machines the surface itself moves slowly from under the depositing current and thus carries its deposit to the discharging point.

All these appliances, when used according to the scientific principles of concentration, are sizing machines, and the grains which deposit upon them do so because of their smaller size, and not because of their greater specific gravity. In order to secure good results from them it is, therefore, necessary to treat only grains which are equal in falling and in which the mineral grains are consequently all smaller than those of the rock. It follows that they cannot do good work, unless the preliminary sorting has been well done.

The second fundamental operation of sorting is performed either by hydraulic classifiers or by jigs. There are two leading varieties of hydraulic classifiers. Those of one kind sort by allowing the grains to fall in a deep on-flowing stream of water. This deposits the quick-falling grains near its head and carries the slow-settling grains further on. Each class of grains is, therefore, deposited at a different point. Another type of classifiers subjects the grains to a series of rising currents of different velocity. Each of these is adjusted so that grains of a certain falling speed will sink through it while the others are carried on.

The jig, though a simple machine, is remarkably efficient; and, unlike classifiers, it does its work very perfectly. It is most remarkable for the fact that, like a jack knife, it can be applied to a variety of uses. It will either sort or size, according to the way it is used. Moreover, it can be made to do good sorting on grains which vary greatly in size. The complex laws of jig action have been the subject of elaborate scientific investigations which are not within the province of the limits of this paper. The greatest American improvements in concentration, however, are based upon certain methods of utilizing jigs. It is, therefore, necessary to refer briefly to the main features of their action.

Mining men are familiar enough with the machine itself, which, in its present form, is very simple. Two to four flat stationary sieves, arranged in a row, are partly submerged in a box or tank of water. The stream which conveys the grains to be jigged is led upon the first sieve of the series and flows along the row to the point of discharge. By means of large pistons applied to the water in the box, it is caused to pulsate or rise up and down in rapid succession through the apertures of the sieves. At each pulsation the entire mass of grains resting upon the sieve is suddenly lifted up a short distance by the water, and is then allowed to fall back upon the sieve. The more rapid falling grains gain a little upon the others during each fall, and finally reach the bottom of the mass. Grains too large to pass the sieve accumulate upon it and are discharged by simple devices. Small grains which pass through the sieve fall into the body or "hutch" of the jig and are drawn off below as "hutchwork." The slow-falling grains accumulate at the top of the mass and are carried off by the on-flowing stream. For some purposes it is necessary to have the water sink down again after each lift. The fast-falling grains are thus drawn down more rapidly by its quick suction. For other work this down suction is injurious. The machine is then so arranged that it will merely give a series of sharp lifts, after each of which the water either falls back slowly or remains stationary.

The jig is applied to three classes of work:

1. It is used to sort grains of the same size, and in this case each jig is fed with one of the sizes produced by the screening apparatus. When such equal sized grains are jigged the quick falling mineral grains promptly descend to the bottom of the mass.

2. It is used to size the grains of an equal falling class which are delivered to it from a hydraulic classifier. In order to accomplish this work each sieve is provided with a permanent bed or layer composed of large grains of heavy mineral. The interstices between these large grains have much the same effect as a sieve. The small or mineral grains descend through them against the rising currents and finally pass into the hutch.

In the German system of concentration the use of jigs is restricted to the two aforesaid operations. There is, however, a third way of using jigs known as the English method of jigging. This is because it was most extensively practiced in the mining districts of Great Britain, and attracted attention because of the remarkable results of the old-fashioned hand jig. American practice has taken up and improved this method of jigging and made it the basis for one of the most efficient modern systems of concentration.

In this method the jig is not fed with grains which have been previously either sized or sorted. On the contrary, it treats the entire mass of material just as it comes from the crushing machinery, and includes grains of all sizes and all specific gravities. A heavy bed of coarse grains is kept upon each sieve and the water pulsations are arranged so as to give a downward suction after each lift. It is found that those grains which are too large to penetrate the interstices of the bed are near enough to the same size to separate very well upon it. The sands and slimes

which do enter the interstices are subjected to peculiar laws of fall and of suction which prevail in such restricted channels. The result is that the mineral grains of greatest specific gravity pass through into the hutch, while the others are driven back and carried off in the tailings. The action of currents in these interstitial spaces has a very singular effect. They lessen the influence which differences in grain size usually have upon their falling speed. In consequence it becomes possible to thus operate at once upon the specific gravity of grains which differ very greatly in size. The very finest slime, however, cannot be concentrated in this way, and must be separated and treated by the usual methods.

The hutchwork concentrates which have been made with such an apparent disregard of size are not very clean, and require another treatment in order to yield a pure product. This is done by the simple plan of repeating the same operation with some slight differences in its details. The impure hutchwork from the roughing jigs is delivered continuously to finishing jigs placed at a lower level. These complete the work and produce clean concentrates.

But one class of machinery remains for consideration, and this is important, because it has found its chief use in the stamp mills of the West. It is, therefore, the basis for what might be termed the stamp mill system of concentration. This class includes vanners, bumping tables, and shaking and jerking tables, of many designs. They are intended to treat only finely crushed material like sand and slime. They do excellent work on assorted grains. Moreover, they do not perform a single fundamental operation, like sizing or sorting. On the contrary, each machine performs two operations in succession, one of which might be termed "settling," while the other is an imperfect zig-zag, generally called "washing." Machines of this class maintain a flat shallow stream of water, which flows down an inclined surface. This stream is not a thin sheet or film, as in the zig-zag machine previously described, but it is from one-half to three-fourths of an inch thick. The crushed material is generally treated as it comes from the stamps and without any preliminary sorting. As the grains settle out of the stream, they are prevented from packing and are kept in a semi-fluid condition by shaking, bumping or jerking movements imparted to the inclined surface. The effect is rather complicated. The quick-falling grains, whether large or small, tend to work to the bottom of the mass, while the small grains tend to sift down through the interstices of the larger ones.

There is no clear or definite separation, but as a final result most of the mineral grains sink beneath the top layer and accumulate near the bottom. This enriched bottom layer is gradually drawn out from under the settling stream. This is effected either by the gradual travel of the surface or belt, as it vanners, or by the crawling action of the grains themselves, caused by the bumps or jerks. The concentrates thus produced by this "settling" operation are impure and have to be cleansed by "washing." This is done on the same machine just before discharge, generally by a thin sheet of water applied in jets. The precise effect of this "washing" varies with the movement and the surface used, and is too complex for analysis here. In most cases it is a quick and imperfect sizing. Although each of the aforesaid operations is imperfect in itself, the two in succession effect a very satisfactory concentration upon fine crushed and unsorted grains.

When machines of this class are fed with equal falling grains produced by a hydraulic classifier, they then become very efficient sizing machines and the concentration is greatly improved. When acting upon sorted grains the settling operation causes the small grains to work through and under the large ones. The final quick washing by a thin sheet of water upon the inclined plane of the machine is, of course, a sizing action, and in this case it is not complicated by the presence of unsorted grains. Vanners, which are the best known of these machines, have found an extensive use for treating sorted grains in complete concentrating mills.

Gold and silver stamp mills operate upon ore which either contains free gold or silver in forms which will yield to the process of amalgamation with mercury. But very few ores found at the present time are strictly free milling, and as a rule part of the values are contained in sulphide crystals. It is, therefore, generally necessary to supplement amalgamation by the concentration process.

Amalgamation requires very fine crushing, and therefore furnishes material very difficult to concentrate. Moreover, there are many stamp mills which are designed solely for concentration, in which this fine crushing has been adopted because the minerals are finely disseminated through the ore. When such fine material is to be concentrated the standard German system for treating sands and slimes, if properly designed, will generally secure the best extraction. At Western mills, however, simplicity of plant is a very important matter. The general preference is, therefore, for machines of the class just described which have the advantage of giving good working results on unsorted or poorly sorted material.

In many cases this desire for simplicity has been carried too far. These machines save more and have greater capacity when they are fed with properly sorted grains. To introduce hydraulic classifiers in a mill causes some complications, particularly when the mill has not been built for their use. The plant also requires more attention and skill. There are few cases, however, when the increased saving will not more than offset these disadvantages. When hydraulic classifiers are adopted, it then becomes a question whether the standard German sizing machines are not best for these sorted grains. Here opinions differ. Rittinger percussion tables, belt percussion tables and revolving buddles now become rivals of the Western vanners, bumping and shaking tables. It may be well to observe that upon most sorted grains both classes of machines do good work. In treating the very finest slime, however, the inclined plane sizing machines, when properly adjusted, appear to have the advantage.

In reviewing the standard machinery and operations of the process, the Missouri and the stamp mill systems have been described. The other two are now easily understood.

The German system is the one most generally used, even in this country. In this system all large grains are first carefully sized by screens. Each of the many sizes is then sorted on a jig. The smaller grains, from sand-size down, are, on the contrary, treated by reversing these operations. They are first sorted by hydraulic classifiers, and each class is then treated in a sizing machine designed for it. Those classes which include the large sands are put through jigs, which are operated as to size, instead of sorting the grains. The fine sand and slime classes are treated upon the standard inclined plane sizing machines, such as Rittinger percussion tables, continuous belt percussion tables and revolving buddles.

The German system requires a complicated plant, which has a comparatively small tonnage for the money invested. The cost per ton is also great, but against these faults it presents the advantage of effecting a closer saving than other systems. It is also preferred for difficult work; when the differences in specific gravity are slight, or when several minerals have to be separated, not only from the gangue, but also from each other.

The Lake superior system was evolved to treat great quantities of ore with a more simple plant. The ore is crushed by steam plants, each head having a capacity of 300 tons daily. The grains, both large and small, are at once sorted into equal falling classes by hydraulic classifiers. Without entering into the peculiar details of Lake Superior jigging, it is sufficient to say that each class of large grains is put through a jig, whose principal function is sizing. This action is complicated somewhat on account of the fact that the preliminary sorting is not very perfect. The concentrates discharged from the hutches of these first jigs are not all pure. Some of the hutchwork is therefore treated again upon finishing jigs set at a lower level. The fine slime and sand classes are sized on revolving buddles, as in the German system. In some mills the hutchwork from the roughing jigs is sorted by hydraulic classifiers before it goes to the finishing jigs.

The mill of the Calumet and Hecla mine has a capacity of 6000 tons of ore per day, and the cost is under 20 cents per ton. This system has also supplanted the German at the copper-silver mines of the Anaconda Company in Montana and also at the Butte reduction works. The Anaconda concentrating plant has a capacity of 6000 to 7000 tons daily.

This system, together with that used in the Missouri lead and zinc regions, is specially adapted to ores which concentrate easily and do not require fine crushing. Constant improvements are being made in their efficiency, and on suitable ores they may yet rival the German system in close savings. It is impossible to discuss the numerous technical points, which determine the question of choice, but it is well to call attention to the fact that the Missouri system is specially adapted to many gold and silver ores of the West. It is, therefore, sure to find a more extended use in this field. A plant of the most simple description applied to suitable ores will give satisfactory results. Through the Missouri mining districts numerous cheap but money-making mills may be seen, which include only a crushing plant and two to four jigs.

Irrespective of the system used, there is a radical distinction between American and European mills in the fact that the latter are intended to save all that is possible out of an ore. There is plenty of capital for elaborate and expensive plants, which will accomplish this purpose, and they are not run at the high pressure which prevails here. American mills are built for a different purpose. In our mining regions capital is scarce, while there is a superabundance of ore. The problem presented is always how to make money most rapidly out of the limited amount of capital which happens to be at hand for mill building. In general, it is most profitable to handle a large tonnage at the sacrifice of close savings, and mills are therefore arranged for this purpose. Even when designed to extract a high percentage of values, it is afterwards generally found best to crowd the machinery beyond its normal capacity, at the sacrifice of its efficiency.

Generally speaking, therefore, the tailings losses of well-designed American mills do not result from any lack of knowledge or skill. The principal losses occur in two ways: In the mineral crystals which remain included in the coarse grains and in the imperfect concentration of the fine sand and slimes. The first loss can only be remedied by re-crushing and re-concentrating the coarse jig tailings. The second loss may be prevented by the use of more elaborate machinery for treating the fine material. Each remedy calls for more capital, and, when this is available, it is generally found better to use it for increasing the entire mill capacity, instead of perfecting these details.

In conclusion, it may be said that the selection of the best system for any particular ore, and the question of how elaborate and perfect the mill shall be, are matters which call for careful judgment. Any error here results in a failure to secure the best paying mill for the money invested. Moreover, in no process is it so necessary to fit the mill to the ore. No two ores break alike, or require the same outfit of machinery in each department of the mill. The selection and arrangement of machines and apparatus, the percentage which will be saved and technical details too numerous to mention all depend on the special character of the ore. In modern mill designs all these metallurgical questions are settled before building, and both the results and the cost of a mill may be known as accurately beforehand as in the case of any ordinary factory.

Temescal Tin Deposits.

In the July number of the *American Journal of Science* H. W. Fairbanks has two papers, the first describing a striking case of contact metamorphism on Black mountain, of the El Paso range, a spur of the Sierra Nevada mountains, extending easterly into the Mojave desert. This is illustrated by a figure showing the diabase dike, with a slaty zone adjoining, of hard, firm rock, into which the soft tufa has been baked. The second paper describes the tin deposits at Temescal, southern California. The tin deposits here lie nearly in the center of a rudely semi-circular area of granite about two miles in diameter and connected on the east with the great body of similar rock extending indefinitely in that direction. The sedimentary rocks along the edge of the granite area consist of quartzite, mica schist and conglomerate of unknown age. A part, at least, of the slates and limestones of the Santa Ana range are Carboniferous. The semi-circular area of granite and portions of the adjoining porphyry has been fissured in a general northeast and southwest direction along almost innumerable lines, and a black vein matter deposited. The veins are generally small, varying from one-fourth to a few inches in thickness, but in the case of the main tin-bearing vein an enormous size is reached at Cajalco Hill. As the hill is approached the veins become larger and finally culminate in this elevation, which is about 300x250 feet in diameter at the base. The veinstone of which it is mostly composed rises in prominent and bold croppings. With one or two unimportant exceptions, the material of which this, as well as the other veins, is formed consists wholly of tourmaline and quartz, with which the tin ores are locally associated. The larger veins, and the Cajalco in particular, are very irregular in size, sometimes appearing to be mere bunches in the granite. A few hundred feet northeast of the hill the vein has narrowed to 6 or 8 feet, and it is here that the large body of tin was first discovered and the main shafts sunk. A slide prepared from one of the smaller veins, which in the hand specimen appeared to consist wholly of tourmaline, showed bunches of tourmaline crystals radially arranged and imbedded in interlocking quartz grains.

In "Further Contributions to the Geology of the Sierra Nevada," by H. W. Turner (17th Ann. Rept. U. S. G. S., 1896, 521–1076), Table mountain, near Oroville, Butte county, Cal., is illustrated in an excellent plate. The deep, steep-sided canyons that have been cut into the uplifted mass of the range often have benches on their slopes, caused by landslides. These, with the falls in the streams and the inaccessible character of the canyons, may be taken as features of a youthful stage of geographical development. Associated with them as indications of recent uplift are occasional fault scarps, still steep and bare, one of these being shown in a plate. Of a little greater age are the fault-block lake basins, now drained by filling with sediments and cutting down at the outlet, Meadow valley, Nevada county, being of this class. Mohawk valley, first holding a Pliocene lake in a fault basin, was afterwards obstructed in Pleistocene time by fragmental andesite flows. Much of the volcanic material, once broadly spread over the Sierra area and now greatly dissected since its regional uplift, is shown to be fragmental, coarse and fine, less or more stratified. It is compared in origin to the mud flows of modern volcanoes. The flows came from the crest of the range and ran for fifty miles on the comparatively gentle slope of the then low-lying region. The "hog-wallow" mounds on the valley plain and margin of the foothills are also described and illustrated.

Electrical Progress.

Electricity in Mining.

The comparatively recent developments in the manipulation of alternating current electricity have, in broadening the whole field of electrical application, extended the use of the current also in the mining industry and given to the mine operator a system extremely efficient and flexible both in its distribution and adaptation. The alternating current possesses one great advantage, among others, which no other system presents, in the ease with which the voltage may be varied. This is done by means of transformers, and allows the electricity to be transmitted at a high voltage, and, consequently, cheaply over long distances, to be transformed down at the point of utilization. It also allows of the use of motors which, equally effective in their performance with direct current motors, are free from commutators and moving contacts, and consequently from sparking, as well as from other shortcomings.

To the mine operator the alternating current system, or rather a modification of it, known as the three-phase system, offers special advantages. Mines many miles apart may be operated by current generated at a single central point, situated where it can be procured and distributed most economically. The electricity, transmitted at a suitable high voltage, on reaching the mine mouth, is reduced in pressure and the wires taken down the shafts carry a low voltage current only. It can then be used not only to drive the mine machinery, but also to light the arc and incandescent lamps on branches from the same main circuits at even a lower voltage than that used for the machines. In case continuous current is required in lieu of alternating, as for the operation of mine locomotives, the alternating current can be converted into continuous in a rotary converter, and the voltage of the latter current regulated to the necessary pitch for the new use. Furthermore, although three wires are used with the three-phase system and two with the direct, the cost of the three wires is one-quarter less than that of the two wires, allowing the same loss in transmission and using the same initial voltage.

The development of electric mining machinery to be operated on the three-phase system has been carried forward vigorously by the General Electric Company, and, convinced of the advantages of the system, while recognizing the need of propaganda, it equipped a large freight car as a central three-phase station with boiler, engine, alternator and station equipment complete. This was held ready for installation at the mouth of the mine of any operator desirous of investigating the economy and efficiency of the system. The installation made, station and mine apparatus were left with the operator. He was then placed in a position to watch both generating and operating machinery and judge for himself. This car was never long out of requisition. To the cutting of coal by machinery the three-phase system seems peculiarly suited. The chain coal cutter illustrated shows the latest type—a stationary frame and traveling carriage carrying the motor, driving gear, feed gearing and cutting chain. The motor is an induction motor laid on its side. It has neither commutator brushes nor moving contacts, and as it cannot spark can be used in gaseous or dusty mines where a spark might result in a costly disaster. The windings of the motor are stationary coils embedded in metal and protected from injury, and as these coils are separately formed and insulated they may be readily removed and replaced. The motor is entirely enclosed and, no starting box being necessary, complete control is given by a simple enclosed switch. The motor stops work the moment it is overloaded, and the machine is thus subjected neither to strain nor breakage. The shaft of the motor is vertical and runs at a low speed, allowing the chain sprocket wheel to be driven by a single reduction spur gear, thus avoiding on the main drive both worm and bevel gears. The feed gearing is driven by a worm at the lower end of the armature shaft. The backward thrust of the feed gearing is taken by a single rack, so located as to compensate largely for the side thrust of the chain as it cuts the coal. Into this rack mesh two pinions, one for the forward and one for the backward motion of the carriage. The reverse lever at the back of the machine throws clutches in or out of these gears, and is so arranged to throw automatically when the end of the cutter travel is reached. A characteristic feature of this cutter is the small amount of gearing employed and the reduced number of wearing parts.

The chain is arranged to take three shapes of bits, each form cutting grooves about 1½ inches deep, separated from the next groove by a ridge of coal which is broken down by the links. The cut is about 4 inches high by 36 inches wide, and the bits, made in the form of an arc of a circle, can be set out as required. This gives a great advantage in sharpening, as no part of the bit except the cutting edge needs redressing, and all of the steel may be used up. The chain is built to stand the strain and the vibration of the cutter. The bit links are of a tough phosphor-bronze and the strap links are steel drop forgings of such shape as to bring all the strain directly upon the solid forgings and not on the rivets.

In rooms where the proper clearance can be obtained, this coal cutter can be shifted or moved from the first position ready for the second cut in an average of two minutes, it being understood that the props are away from the face, the floor reasonably smooth and the face of the coal properly squared. The time of loading and moving the cutter from room to room will average about fifteen minutes, provided the rooms are adjacent. The time required for setting the bits will average ten minutes. The cutter has in favorable coal, where other conditions were rather unfavorable—such as roof, props, track, etc.—been able to average eight cuts or runs each 36 inches wide per hour, or at the rate of 240 lineal feet per ten-hour shift. The conditions can scarcely be so unfavorable that it will not always be able to average at least four runs per hour.

An approximate idea of the number of machines required for any particular mine can be obtained from the following formula, which gives the tonnage output:

$$\frac{(\text{Number of ft. face per 10 hr. shift}) \times (\text{depth undercut}) \times (\text{height coal})}{27 \text{ cu. ft.}} = \text{Number of tons run of mine coal.}$$

To reduce this to lump coal, the percentage of fine coal that passes through the screens from pick-mining is ascertained. The percentage of lump from the machine will then be 25% greater than when produced by pick or hand

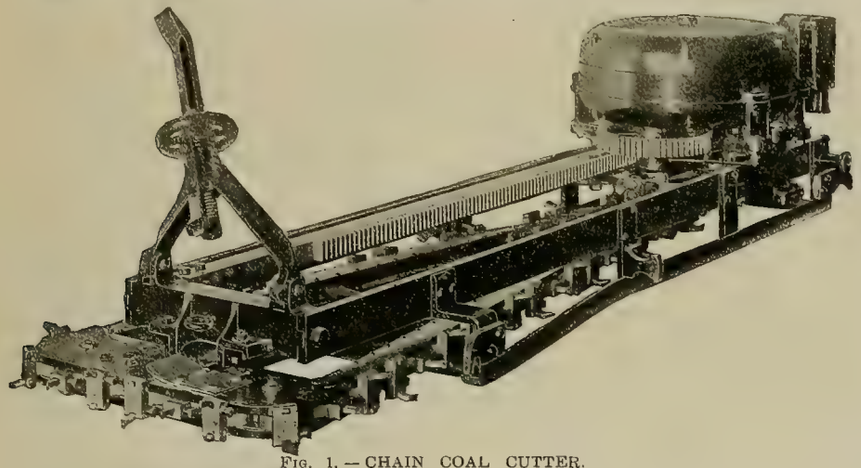

Fig. 1.—CHAIN COAL CUTTER.

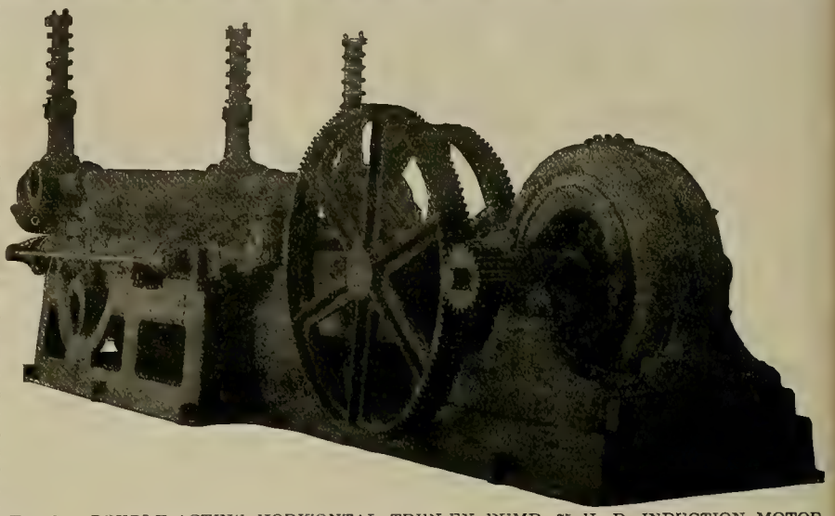

Fig. 3.—DOUBLE-ACTING HORIZONTAL TRIPLEX PUMP, 75 H. P. INDUCTION MOTOR.

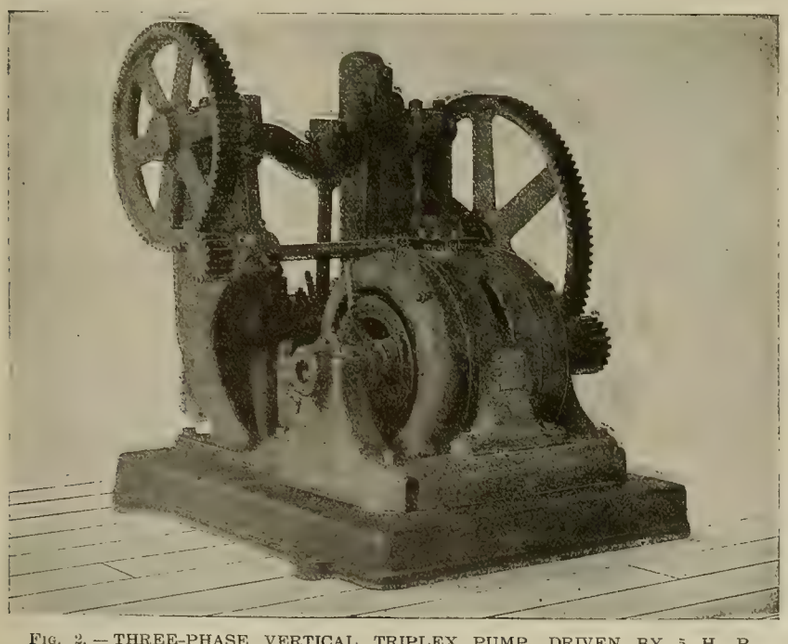

Fig. 2.—THREE-PHASE VERTICAL TRIPLEX PUMP, DRIVEN BY 5 H. P. INDUCTION MOTOR.

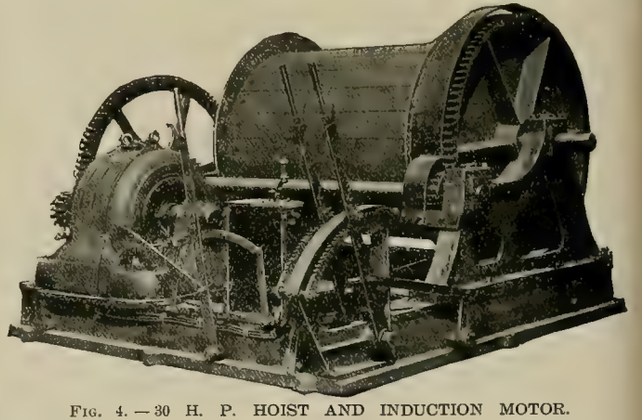

Fig. 4.—30 H. P. HOIST AND INDUCTION MOTOR.

abor. The amount of powder to shoot or break down the coal is also largely decreased. Any coal that would require ordinarily an 18-in. cartridge to break down, will require when the same coal is properly undercut with the machines, an 8-in. cartridge for the same or a greater amount of coal.

Accompanying the cutter is the electric mining pump, which presents the great advantage of portability, which renders the electric pump superior for mine work. With an electric pump the pump-shaft is free from all machinery. It contains only the conductors and discharge pipes. Indeed, the three-compartment shaft so common in mines, one for pumping and the other for hoisting, can by the use of the electric pump be reduced to two, as the discharge pipes and wires which occupy so little space can be placed in one of the hoisting compartments. Furthermore, the three-phase pump requires no attention beyond an occasional oiling, and needs no attendant to start or stop it. It can be operated by a switch from the engineer's office at the mine mouth.

There are different types of electric mine pumps, but the three-phase pump presents features of excellence similar to those noted in the coal cutter. Our illustration shows a Knowles 4 in. by 6 in. vertical triplex pump, with a capacity of sixty gallons a minute against 300-foot head. It is driven by a sparkless induction motor of 5 H. P. capacity mounted on the same bedplate as the pump and driving it through a double reduction. The weight of the motor and pump complete is about 2480 lbs. Another type of of three-phase pump is shown in Fig. 3. This is a Knowles 7½ in. by 12 in. double-acting horizontal triplex pump, having a capacity of 600 gallons a minute against a head of 200 feet. The motor is also of the sparkless induction type, but of 75 H. P. capacity and the outside dimensions of the combination of motor and pump are 9 feet high 6 inches wide and 25 feet 6 inches deep. This mine pump is now in use in Mexico.

This description of three-phase mining machinery would be incomplete without an illustration showing the application of the induction motor to the hoist. Fig. 4 is rated at 3300 pounds at 200 feet per minute. The drum is 4 feet in diameter and 5 feet between flanges. It is fitted with friction clutch and usual hand brake and is stopped, started and reversed by a cylindrical switch or controller. The lever at the left of the controller is connected to the resistance switch by a cam, and is used for short-circuiting the resistance in the armature as the motor comes up to speed. The motor is a standard General Electric 30 H. P. motor, with the denomination of 8–30–900.

Generally speaking the use of electric mining machinery reduces materially the amount of deadwork, and, in the case of the cutter, reduces the amount of haulage. These two factors alone result in a decreased cost of mining, and although it is difficult to state the extent of the saving, the practical operator will be able without effort to realize the benefit derivable from the use of electric mining machinery. Beyond those already mentioned the following may be enumerated: Ventilating fans may be placed in any part of the mine and be driven by motors; partitions can be lighted by incandescent lamps; the coal can be hauled by electric locomotives and all with no greater encumbrance in the mine workings than some small wires strung on porcelain conductors out of sight, almost on the roofs.

Cost of Power for Trolley Cars.

The annual report of the Railroad Commissioners of New York and Massachusetts contains a table for nearly all of the street railway properties that shows the cost of the electric power required to run a car one mile under average conditions of load, etc. The table gives the number of cars owned, the car mileage per year and the cost of the electric power per car mile and per passenger. Of the nineteen companies operating less than 250,000 car miles, four are obtaining power at a cost of less than two cents per car mile, six between two and three cents, five between three and four cents, one between four and five cents, and three at more than five cents; of the five companies operating over 5,000,000 car miles per year one obtains the power for less than one cent per car mile, three between two and one cents, and one between two and three cents; other similar figures are also given between these limits. The Brooklyn Heights Company has the cheapest power, 0.86 per car mile, followed by the Binghampton with 0.94: the cost of power for the Massachusetts roads includes repairs and depreciation of the station plant, which is not the case for the New York roads.

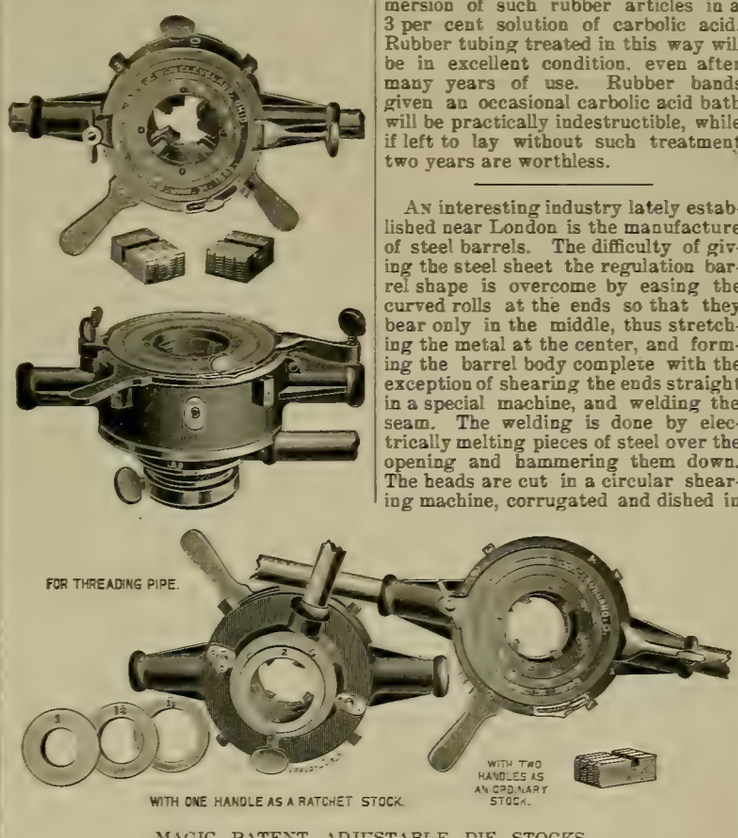
Mechanical Progress.

Adjustable Die Stocks.

The Magic patent die stocks, herewith illustrated, combine several mechanical principles in a way that will commend them to the machinist.

They are claimed to be lighter and stronger than some other makes.

Each tool is warranted to stand the hardest usage required of a threading tool. The dies are made of tool steel,



MAGIC PATENT ADJUSTABLE DIE STOCKS.

are quick opening and can be instantly released from the work without running back over the finished threads. The patent gauge enables the operator to cut any number of threads of the same size with one adjustment; also enables any inexperienced person to make exact duplicates. The dies and guides are self-centering and adjustable to variations in fittings without hammer, wrench, screw driver or other tools. One set of guides adjusts for all sizes the tool will thread, thus insuring in every case, whether over or under size, a perfect center of the work to the dies, and makes it possible to produce a perfectly straight thread. The stocks can be fitted with dies of special threads, or with brass and bolt dies. There are no loose bushings with the stocks which cannot be found when required. The cut-off is practical, combining two tools in one. The cut-off blade can be quickly removed and sharpened on a grindstone. The manufacturers say theirs admits of "the quickest and simplest method of putting the dies in the stock, without lifting covers or contending with other devices which consume time. Put the dies in the slots as far as they will go, and you are ready for work." Long-continued use does not affect their reliability and ease for operating.

Parke & Lacy Co., 21 and 23 Fremont street, San Francisco, are the sole agents for this coast.

THE importance of leaks in a steam plant is brought out with distinctness by the following: A square inch of area will discharge one-seventieth of a pound of steam per second for each pound absolute of pressure. Suppose a station to have 125 pounds guage, 140 pounds absolute pressure, then a square inch of area would discharge two pounds of steam per second or 7,200 pounds an hour, which at the standard rate of thirty pounds per hour per H. P. is 240 H. P. How many leaks does it take to aggregate a square inch? In a small station the unsuspected leaks assume a large proportion of the steam produced.

ONE of the greatest objections to the use of rubber is its quality of crumbling or breaking after it has been used for a while. Many methods of preventing the breaking of rubber articles have been suggested, but the most reliable seems to be the least complicated, i. e., the occasional immersion of such rubber articles in a 3 per cent solution of carbolic acid. Rubber tubing treated in this way will be in excellent condition, even after many years of use. Rubber bands given an occasional carbolic acid bath will be practically indestructible, while if left to lay without such treatment two years are worthless.

AN interesting industry lately established near London is the manufacture of steel barrels. The difficulty of giving the steel sheet the regulation barrel shape is overcome by easing the curved rolls at the ends so that they bear only in the middle, thus stretching the metal at the center, and forming the barrel body complete with the exception of shearing the ends straight in a special machine, and welding the seam. The welding is done by electrically melting pieces of steel over the opening and hammering them down. The heads are cut in a circular shearing machine, corrugated and dished in a 400-ton hydraulic press, and secured in place by a ring of metal, which is welded to both the end of the barrel and to the head. The bung bosses are also welded on. The welding by the Bernados process requires no skilled labor, and but moderate power is needed to supply the current.

AT the conference of the Institution of Civil Engineers in London lately, in the course of a discussion it was strongly brought out that nickel steel is the coming material for shipbuilding, provided its cost can be made satisfactory. For this, it was said that new deposits of nickel must be discovered and the cost of its metallurgy must be reduced.

A NEW fireproof building brick will shortly be placed upon the market. The block is composed of pulverized stone, marble, coal cinder or sawdust mixed with magnesia and two secret chemicals. The composition in liquid form is poured into moulds of the desired size and the "setting" follows by chemical process, no baking being required.

Scientific Progress.

A Greenwich Transit.

At the Greenwich Observatory the transit circle consists of a large telescope, the outside of which is not unlike a great cannon, being of solid iron, and is supported by trunnions which allow the telescope to be elevated or depressed, to point north or south, and to make a complete revolution, but never to diverge from the north and south line. Its field of view is large, admitting a great amount of light, thus fulfilling its purpose, viz., that of noting the exact time at which stars and planets pass south and north of Greenwich. Upon looking through this telescope is noted what seems to be a vertical row of iron bars at equal distances from each other—they are, however, spiders' webs, the center one, passing through the focus of the object glass, being the meridian line. By observing the time, therefore, at which the "clock stars" pass over these web lines, or "wires," as they are called, is sidereal time regulated.

A REMARKABLE PATENT has just been granted by the German Patent Office. It is for making rubies. M. Gin, the patentee, has discovered that by volatilizing alumina in an electric furnace in conjunction with certain coloring substances the vapors, upon cooling, become rubies of any desired size and indistinguishable from the natural ruby. The artificial ruby has the composition, form, color and hardness of the natural ruby. It is well known that by passing a suitable and sufficient current of electricity through carbon, enclosed in an iron rod, very small diamonds have been made. They are not of commercial value on account of their smallness and of the difficulty of recovering them from their matrix. M. Gin's success with volatilized alumina suggests great possibilities in the artificial production of diamonds and other gems. In this connection it is interesting to learn that the British Patent Office has allowed a patent for making gold, and that in the United States Patent Office is pending an application for a similar patent.

FLUORINE has been at last liquefied. It becomes liquid at —185° C., is clear yellow and possesses great mobility. At this low temperature silicon, carbon, sulphur, phosphorus and reduced iron previously cooled in liquid oxygen and then placed in an atmosphere of fluorine, do not become incandescent, and the iodine of potassium iodide is not displaced by fluorine. Benzene and turpentine are, however, decomposed with incandescence when the temperature rises to —180° C., showing the great affinity of fluorine for hydrogen. Note is made of the fact that when fluorine is passed through liquid oxygen a white flocculent precipitate is formed, which, when filtered off, deflagrates with great violence as soon as the temperature rises. It would seem to be a compound of fluorine and oxygen, and is being further investigated.

ACCORDING to Prof. Dewar, when the earth freezes and all forms of life disappear, there will float above the present ocean of water, long since changed to ice, an ocean of liquid air 33 feet deep on the average.

AMONG the animals which surpass man in the ratio of brain weight to body weight are the following: Among the Rodentia squirrels and mice, among the Primates many old and new world monkeys.

THE extreme degree of external atmospheric heat which can be endured for any time has never been determined, but as high as 400° to 600° F. was endured by Chabert on experiment.

It is said that the patterns on the finger tips are not only unchangeable through life, but the chance of the finger prints of two persons being alike is less than one chance in sixty-four billions.

Mining Summary.

CALIFORNIA.

Alpine.

For the first time in twenty years, writes our Alpine county correspondent, Alpine county is moving in mine development. Mr. Packard, representing the Michigan company that has taken hold of the Leviathan copper mine at Monitor, will put men to work on the mine.

Amador.

C. D. Canon, part owner of the Daisy mine at Pine Grove, and Andreas Bros. have bonded that mine, through C. H. Wilson, to a Denver syndicate headed by C. H. Wolcott, for $30,000 for one year, payable in monthly installments. The company will thoroughly develop the property.

W. Craib has the Krueger & Vaughn mine bonded, and is virtually the owner of it. This mine is known as the two first south extensions of the Amador Queen No. 1, which extensions were worked in 1852 by an arrastra. Three years later, 1855, the output, which ran $7 to $8 per ton, was milled, but at that early period before improved methods were introduced such rock would not pay, and the work, except so much as was necessary in order to secure a patent on the claim, was given up. He is cleaning out the old abandoned shaft, which was put down in 1854, preparatory to sinking deeper. In doing this he will go down from 150 to 160 feet.

The *Record* says the new 40-stamp mill at the Argonaut is going up and the company expects to have the stamps dropping some time in September. The runs from ore crushed at the Zeile mill have proved dividend-paying. The Amelia, formerly the Muldoon mine, is sinking; a new hoist is being built and other improvements of a permanent nature.

The Jackson *Dispatch* reports the Monte Cristo mine is being worked by Mr. Dillon. At first it was intended to run the mill with water power, but the water failing, steam was resorted to, which has delayed the start.

It is the intention of the men having the Muldoon mine bonded to sink the shaft 1000 feet and then drive a drift north and a crosscut to the east. They are going down on the ledge, and the shaft will be put down the desired depth as rapidly as possible. The easterly crosscut will be the width of the ledge. A steam hoist is now being put up over the shaft.

Supt. McLaughlin of the Iron Mass says that the shaft has been put down 48 feet since the 3d of July. Sinking goes on.

The Zeila Chlorination Works have started up again, and now the whole plant of the mine is in operation. The Zeila is one of the institutions of that county, and it makes a material difference in the prosperity of the community whether it is at work or idle.

Butte.

Frick & Pratt of Chicago have bought all the machinery of the Palo Alto mine, including the batteries, Burleigh drills, etc., and will remove the same to Granite Basin and rebuild the mill on the Robinson mine.

At Enterprise J. Carlisle is now putting five more stamps in his quartz mill and will then have ten at work. He will have about twenty-five men in a short time. The Denver mill is still idle. The Red Point mine is still being worked. Mr. Champion was up from San Francisco a few days ago. If he does not sell the mine he will put in a 25-stamp mill. A new tunnel is being run on the Pactolian mine near Hurleton. Twelve men are employed at the Crystal Peak mine. The rock is paying well.

Register: There was delivered last Monday an engine for the Banner mine, capacity 250-horse power, weighing over eleven tons. Mr. Evans, the superintendent, is placing this for sinking 2000 feet.

The *Mercury* gives a list of Butte county mines and their yield for 1896. The names of the mines are left out. The term "county mines" means gold sent to other counties from Butte: Bangor, $15,000, 1400, 4000; Bidwell's Bar, $1000; Berdan's, $11,000.25, 75, 17,800, 1700, 900, 500, 600, 300, 400, 3500; Berry Creek, $20, 20, 125, 128, 50, 500, 100; Brush Creek, $3000, 500; Butte Meadows, $200; Cherokee, $1100, 75,000, 3000, 500; Chaparral, $9000; Clipper Mills, $400, 300, 400, 250, 5000, 1000; Concow, $75, 5000; Coutolenc, $10,000, 3000; Enterprise, $1950.68, 500, 600, 1200, 3850.90; Forest Ranch, $1500; Henry, $45,000, 2000, 600; Hurleton, $12,000, 1468, 15,000; Inskip, $1800; John Adams, $4460, 11,245.40; Lumpkin, $600, 3000; Lovelock, $260, 500, 1200, 2481.29; Magalia, $71,405.73, 5000, 10,000; Mooretown, $200; Merrimac, $3000, 500; Nimshew, $10,032, 2525.65, 3000; Oroville, $40,000, 35,000, 135,000, 10,000; Palermo, $600; Powelliton, $850, 199 50. 2000, 500; West Branch, $600, 450, 300, 750; Wyandotte, $200, 175, 400; Yankee Jims, $250, 100, 230, 1000, 2000; county mines, $148,679. Total, $744,316.

Calaveras.

The poles and wires of the California Exploration Company's electric line are in position as far as the Kentucky House, a distance of seventeen miles from the plant on the Mokelumne river. Mokelumne Hill and San Andreas have been wired for lighting purposes, and the company expects to have everything in active operation by August 1st.

Chronicle: At San Andreas the Stevens mine was recently bonded to P. L. Schumann, the owner of the Paragon group of mines at West Point. The water has been pumped out of the old shaft, which was 100 feet deep, and sinking continued for 25 feet farther, when the ore was tested. The test went $20 per ton. The shaft will be sunk 300 feet deeper as soon as the machinery can be hauled to the mine.

Flattering reports come from the Golden Hill mine, one of the California Exploration Company's properties, situated about two and a half miles west of this town. At a depth of 240 feet in the shaft the vein is 7 feet wide, and a sample of the ore in a recent test went $140 per ton.

The Fellowcraft mine near San Andreas, owned by Provard, Lewis and others of Oakland, was bonded about a year ago to some Eastern parties. The bond expired and the mine has reverted to the original owners, who are now reopening the property.

Preparations are being made to sink a shaft 500 feet deep on the J. R. mine at Old Gulch. A tunnel will then be driven from O'Neill's creek to tap the ledge at a depth of 350 feet. Grading for an 8-stamp mill was completed last week and the machinery is now being hauled to the mine. Good milling ore is being taken out from what appears to be a "blow out" from the main ledge. The property is owned by a stock company, of which Ballard of the Rawhide mine in Tuolumne county, Dyer of San Francisco, Budd, Thompson and McDougald of Stockton are the principal stockholders.

Kern.

The Rand group employs thirty men. The Garlock mill is crushing ore therefrom. The Wedge and Kinyon mines are still milling good ore.

A coal mine four miles northwest from Garlock, with a vein about 18 inches thick, has been sold for $15,000.

Randsburg *Miner*: There are ten tons of coal on the dump at the coal mine, the vein is growing thicker and the coal better as depth is attained.

The last fifty-six tons of Kinyon ore milled produced $8445.21, and the tailings, which assayed $19 per ton, were sold for $600, making a total of $9045.21. G. B. Kinyon & Sons shipped out thirty-eight and one-half pounds of gold bullion last Sunday as the result of a recent run. This makes the product of the mine $15,000 for the month.

The Little Butte No. 1 shaft is now down about 280 feet and the ore averages clear across the ledge, at the foot of the shaft, a little more than $43 per ton.

Los Angeles.

In the northern part of Los Angeles county there is a good gold section. The Red Rover mine, near Acton, has the deepest shaft in the county, work having been extended to about 600 feet. A 10-stamp mill is running rock.

Mariposa.

(Special Correspondence).—It is announced that the Merced Co. will abandon the Malvina mine on August 1st, and the work of stripping the lower levels of everything movable has already begun. This mine has been considered the best of the Cook properties, and a large amount has been expended on it in exploration work with indifferent results. The development includes a three-compartment shaft 1000 feet deep, crosscutting the ledge at the 200, 400, 600, 900 and 1000 levels, with more or less drifting on all but the latter level. A winze also extends to the 600 level, and a tunnel 3000 feet long connects the workings with the mill. A great deal of stoping has been done from the 600 level up, large quantities of the broken ore still lying where it fell. The shafthouse of iron is the largest in the State and the engine one of the finest. While the vein, which has ranged from 3 to 20 feet in width, carries streaks of rich rock, it has thus far not been possible to mill it at a profit, one month's run under Capt. Couch running as low as $1.65 per ton, according to published reports. The closing of this mine, following closely that of the Louisa, leaves only the Mary Harrison mine in commission. Some exploration work is to be done on the Dahlia, adjoining the Mary Harrison, in the hope that a body of good ore may be uncovered. Though few people believe either the Malvina or Louisa has been thoroughly tested, it is not thought the present company will make any further attempts to develop them. The history of the company for the two and one-half years of its existence has been a remarkable one, and the gossip over its peculiarities of management has discredited every legitimate mining enterprise in Mariposa county until recently. The statement of one of the purchasing syndicate, made at the time to a San Francisco reporter, that "they would show the California people some things about mining," was not an empty boast.

Coulterville, July 27th, '97.

Nevada.

Fifty pounds of quartz taken from the Plumbago mine, above Moore's Flat, was pounded out in a hand mortar this week and yielded $5800.

Dana Harmon, superintendent of the California mine, God's country, has a tunnel which taps the ledge at a depth of about 800 feet and gives nearly 1000 feet of backs. One hundred tons of rock crushed averages from $10 to $15 per ton, some of the ore going as high as $45. A new 20-stamp mill will be erected, with provision for adding twenty more later on. It will be the deepest working ever done in that section.

Union: In the 500-foot level of the Reward a ledge is being stripped which averages 9 inches in thickness. There is a streak running fully 60 per cent sulphurets, and which will yield about $225 per ton. Superintendent Gribble has nearly 200 sacks of this ore sacked up, and will ship it to the smelter. On the 400 level, which is their drain tunnel, they had this same ore, so that in striking it in the 500 they are sure of 100 feet of backs.

Transcript: Ore recently taken from the Montana mine in Willow Valley district assayed $274.61 per ton. The work of sinking the shaft is going ahead.

Placer.

The Pioneer mine produced $14,156.08 in June; expenses $5,100, net earnings $9,056; 650 tons were crushed, average yield per ton $21.77; nine tons of sulphurets were saved, not included, which will mill from $85 to $90 per ton gross. The company has lately purchased 160 acres of timber land, paying $3.25 per acre.

Plumas.

The *National-Bulletin* reports that the water has been pumped out of the Thistle Shaft mine, but that the mouth of the tunnel is nearly filled with sand and timbers. It is estimated that two months' time will be required to put the mine in shape for active work. Men are being put on.

Sacramento.

The report from Folsom regarding the striking of a rich pocket in which thirty-one ounces of gold was taken out in one panful or less of dirt, is corrected by the statement that the gold weighed thirty-three ounces, and was taken out in Sacramento county, nine miles south of Folsom, at what was known in early days as Wall Town. It sold for $575; very good pay for a half day's work.

Shasta.

The new strike near the Gladstone mine, French Gulch, is described by the *Free Press* as lying 150 feet east of the Giant tunnel and 150 feet east of and parallel with the Bull ledge, upon which most of the work in the Gladstone has been done. A layer of black soil about a foot deep covers a layer of decomposed quartz and earth 3 feet in thickness and very rich. Underneath this lies the main ledge, which is 4 feet wide and well defined. Its course is east and west, and has been uncovered a distance of 75 feet along the surface, but neither end of it has yet been found. The top soil carries no value, but the decomposition material yields $15 per ton in gold. A tramway has been built along the side of the mountain, and the decomposed ledge matter will be carried to and worked in the mill. The new discovery will be prospected at various depths by running tunnels from the old workings, and, if the ledge carries sufficient values, it will be crosscut at a depth of 450 feet by a tunnel 250 feet in length. It is expected that the mill will be in operation by August 10th, at which date it is expected that there will be 300 tons of ore on the dump.

A. B. Paul, manager for Dr. W. H. Garlick, the Ohio capitalist, has ordered the employes of the Garlic electric plant at Bull's Bar, near Copley, to go to the site of the Brumfield dam on Spring creek and rebuild the dam, it having been recently destroyed by the employes of the Mountain Copper Company during a squabble over the water rights leased by the company from Garlick. The rebuilding of the dam will mean the resumption of operations at the power plant, and, consequently, at the Hart mill and mine in Old Diggings, which have been compelled to lie idle ever since the power plant was closed down, as they were entirely dependent upon that source for motive power.

The London Gold Tunnel Company, operating at Mule mountain, seven miles from Redding, claims to have cut through four well-defined fissure veins, all of which made a creditable showing, as most of the vein matter runs high in gold. The veins thus far encountered are from 4 feet in width and upward. The tunnel is now passing through a large ledge of gold-bearing quartz, which is said to be over 100 feet in width. This company is running a crosscut tunnel to cut the whole formation of Mule mountain upon which the mines are located.

The gasoline hoisting plant at the Evening Star mine, in Old Diggings, was placed in operation Thursday. The ledge is 2 feet in width and carries rich gold ore, which is being hauled on wagons to Redding and then shipped by rail to the smelter of the Mountain Copper Company at Keswick. Wm. M. Fitzhugh is the owner of the property. He proposes to sink the shaft to a depth of 300 feet.

Miner: The Mountain Copper Company have engineers surveying for a railroad to their Windy Camp properties. The company is now experimenting with a new furnace for roasting powdered ore. They have a great deal of this ore on hand, and if it proves successful they will erect a great many more. They are also hauling down about eight trains loaded with ore a day, which is more than they have ever brought here in the past. Last week the *Miner* noted that the Mountain Copper had fired up a third furnace, giving employment to about sixty more men. It ran just one week, when the company was compelled to close it down for want of men. This occurred Thursday night, but Friday morning a sufficient force was secured to start up again. Hardly a day passes that the company is not seeking help, and there is not an idle man in the camp, except from choice. Men who are willing to work, and will stay with the job, find no trouble securing employment in and about the smelter. There are no soft berths, however, but the pay is good and the employment steady, so there is no excuse for idle men in this vicinity.

Searchlight: The Niagara mine, of which R. E. Henley is superintendent, has undergone complete reorganization, and is starting up with good prospects, with about twelve men employed.

Sierra.

The Craycroft hydraulic cleanup for a short run this season was $11,519.60.

Siskiyou.

Reports from the Lower Klamath to the *Journal* state that that section of Siskiyou presents a lively appearance at present, owing to the large number of men who are employed in the mines in that section. The Minetta B. mine employs quite a force on Thompson creek, in operating the plant at that property, and the Klamath Flume and Mining Co. also have a number at work in their mill, and will employ many more during the summer and fall months, in completing their ditch and flume, and in getting their mine in shape for work. The new deal which has just been consummated, about twenty miles below Happy Camp, whereby a Chicago capitalist secured a large tract of mining ground, and which will be developed on an extensive scale, will also be the means of employing a good force.

The mines in the Salmon river country this season are producing well, and that section will no doubt contribute its usual amount of gold to the product of the county, which will probably reach over a $1,000,000 this year. While many of our miners are ready to rush off to Alaska, where prices are high and hardships of all kinds have to be endured, there are still large tracts of mining ground in Siskiyou county, which will yield handsomely if worked in a systematic and faithful manner.

The Distlehorst dredger is now at work at the lower end of W. D. Walker's place, Klamath river.

The Katie May mine on Greenhorn will soon be in shape to take out a large quantity of ore, which it is expected will be even richer than what has been taken out previously, and that was in the neighborhood of $100 a ton. The running of the tunnel which has occupied their time for a number of weeks will tap the ledge lower down.

There are still numerous good placer mining claims on the rivers in this county, as is shown by the successful operations of the claims on the Klamath. A great deal of ground that was worked in early days was gone over in such a superficial manner that it pays to work it again. Some of the old claims on the flats west of Yreka have been worked over several times.

Trinity.

The Altoona mine has finally been unwatered. Last April miners working in the lower tunnel struck water, which rose several hundred feet in the shaft. For nearly four months pumping machinery was kept working constantly, and the mine is now again in condition for work, which will be resumed at once. The property is one of the best quicksilver mines in the State.

The Brown Bear mine near Deadwood has 150 tons of sulphurets awaiting shipment to the Selby Refining Works. The large freighters who are busily engaged in hauling in the LaGrange piping are also employed to bring out the sulphurets, thus given an opportunity to realize on both trips.

Hall City, where the recent mining discovery was made, reports an assay representing 200 feet across the vein, with an average return of between $4 and $5 per ton. The ore is free milling and could, it is figured, be handled at $1 a ton.

Journal: The mine of J. A. Koons of Lower Trinity, will be fitted up with a hydraulic and all modern improvements and will be operated next winter.

It is reported that in taking up the sluice boxes in the Bussell mine preparatory to deepening the bedrock cut and the placing of new sluices, some $600 was obtained in amalgam, which had leaked out of the old sluices and was a loss to former proprietors, who had no idea of it being there.

Tuolumne.

The Providence mine, on the north fork of the Tuolumne river, fifteen miles from Sonora, has been bonded. The shaft is down 140 feet.

West and Richards have re-named the Easton mine as the Yellow Jacket. Drifting is being prosecuted north and south at the 200-level. The Sonora *Democrat* reports that the rock mills $30 per ton.

At the Grizzly a hoist is being placed over the new shaft, now down 400 feet, to the bottom of the old workings. From this point on operations will be in virgin ground. The vein, cased in by metallic slate, carries a width of from 3 to 10 feet. The mill clean up shows from $8 to $12 per ton of ore run through.

At the Tarantula the compartment shaft is down 170 feet. J. D. Redding is shortly expected at the mine, when arrangements will at once be completed for the erection of a steam hoist.

At the Black Oak the main shaft is near the 700-level, and three shifts sinking as rapidly as possible. Two new cyanide plants will shortly be added to the one already in operation, one of which will be on the agitation plan and the other leeching. This will give large cyanide works and insure a saving of 90 per cent. Another six drill air compressor is being put in and will be at work next week. The 200 tons of ore shipped monthly to Selby's for reduction give returns of from $88 to $100 per ton. The mine is looking better than ever before, and the ledge shows a strong and solid 12 feet of quartz from wall to wall.

The Arbona has just completed its new 10-stamp mill.

Superintendent Johns of the Continental is having the site for a 5-stamp mill graded out.

The Porto Fino, owned by William Sharwood, shows a vein of from 10 to 12 inches that mills from $25 to $50 per ton in free gold; the sulphurets give an average return of $150 per ton.

The Seminole group of mines, comprising ten locations, in the East Belt, will shortly be operated. The mine is being managed by Col. J. L. Coles.

Independent: The Mustang mine near Summersville has been bonded. A 10-stamp mill will be erected on the property within sixty days.

At the Trio improvements continue. The foundation for the big engine has been laid. The large air compressor will soon be placed in position.

G. Stayton is arranging to have the Badger mine near Rawhide reopened and work pushed.

At Arrastraville Cullers & Rozier crushed twenty-four tons of ore taken from the Little Beauty mine that showed up $1800.

At Tuttletown the mines continue to show up well and more men find employment. Part of the Churchill mine has been sold to the McGinn Bros. The mine will now be systematically developed.

Yuba.

G. W. Smethurst of Brown's Valley has finished crushing a trial lot of ore from his mine, "The 78," which yielded a return of about $50 per ton. The Webb mine is running

wenty stamps. On the Pennsylvania the water is out below the 600-foot level and work s rapidly progressing downward.

NEVADA.

The Dexter Mining Company has about concluded to put in a new mill at its mine at Tuscarora.

The White Pine *News* says F. Paul has shipped another carload of silver-lead ore from the Ontario mine to the Selby Works.

From Alum creek, ten miles from Hawthorne, is reported the discovery of a ledge assaying $16 to the ton. S. A. Knapp and J. W. Yerington, the principal owners are making a mill test to ascertain the importance of the find.

The sheriff has attached the property of the Gold Creek, Nev., Mining Company, including the sluice-boxes containing gold just ready to be cleaned up, to cover an indebtedness claimed of $3900 by Correy Bros. A bond was subsequently furnished and the attachment released.

Eureka *Sentinel*: Messrs. Carr and Rader, who represent heavy capital in Kentucky and Indiana, made an examination of several of our mines during their visit last week and found them to be all that had been represented. Their interest at present centers mainly in the Barton, Altoona, and the Oriental and Belmont Consolidated. They do not wish to undertake further developments alone, but desire the co-operation of the present owners. They will take the majority portion, however, of those mines, agreeing to put up hoisting works and necessary machinery, and will sink 500 feet on some one of the mines, running levels at every 100 feet, so as to prospect thoroughly. This is the most important part of the arrangement now being crystallized, and if all parties can agree work will be commenced within sixty days.

STOREY COUNTY.

The new strike in the Sierra Nevada mine shows a vein of ore assaying, $40 per ton in gold, has been found in east crosscut 5, started from the northeast drift at a point 444 feet north from the Layton tunnel. The crosscut is into the ore about 8 feet and samples gave the above assays. New discovery is regarded as important, not only because of its gold ore, but occurring in unexplored ground.

Carson *News*: The V. & T. is putting in a sidetrack to the old Nevada mill tailings. As soon as the the track is completed the work of hauling the tailings to the Empire cyanide plant will be commenced.

OREGON.

The Black Butte mine, the heaviest quartz mine in Grant county, has closed down for the season on account of the mill failing to work satisfactorily. The mill was hauled a hundred miles last year from Heppner over mountains at big expense.

The Virtue mine, near Baker City, is now producing $20,000 monthly.

Capt. Nash has bonded the Golden Standard mine in Galls Creek district, owned by H. D. Kubli and Hon. E. B. Watson, for $125,000. John Daggett of San Francisco and other California capitalists are interested in the bond.

Superintendent Meizer of the North Pole mine has brought to Baker City seventy-five pounds of gold, equal to $18,000. This is the heaviest cleanup of that mine thus far, and it was made in about three weeks' time, says a Baker City dispatch. The burning up of the boarding house hampered mining operations there somewhat. The gold bricks will be held for Alexander Baring's inspection. He is the London owner, and is expected here early next week.

The *Times* says there is renewed activity in mining in southern Oregon, due perhaps to the abundant water supply of the past season. The annual cleanup season holds surprises for the most sanguine owners, and all who own mining property in southern Oregon look upon it as decidedly more valuable then it was considered in past seasons. The result is a boom in mining locations, and numerous prospective sales of valuable properties.

Journal: W. S. James of Gold Hill, Nev., has bonded the Albany group of mines of eight claims, Mt. Reuben district, for $25,000 within one year from August 1st. Mr. James will do considerable development work.

The Horn-Silsby-Tucker mine, on the Illinois, is sold to Mrs. Wilder and S. F. Hayward for $20,000. The new owners will extend and enlarge the ditch.

WASHINGTON.

The Methow Mountain Mining Company, owning the Anchor group of claims on Squaw creek, has a letter from W. J. Moore, foreman of the works, with forty pounds samples from the tunnel being driven directly under the ledge, showing values in copper 6.5, 5.3 and 4.6 per cent to the ton.

The discoveries of ore in Washington capable of reduction by the cyanide process has caused the representatives of several different processes to send represensatives here to investigate, says the Spokane *Review*. One of these is Thomas Hart of Montana, who has returned from the reservation, where he went under instructions from Prof. J. E. Clennell, who is in charge of Charles Bros.' cyanide plant at Salt Lake City. "I believe the mines at Eureka will be a great success under the cyanide treatment of the ores," he says. "The rock is nearly pure silica. I brought out a ton of samples mostly from the workings of the Republic, for treatment by the Siemens-Halske process at Salt Lake, and the ore was shipped from here this morning."

BRITISH COLUMBIA.

The Pilot Bay smelter has been bought by the Omaha & Grant Smelter Company of Denver, Colo., and Omaha, Neb. Its capacity will be increased by two stacks, and the company will operate it as a custom smelter for treating Slocan and Rossland ores. The plant of the Pilot Bay smelter consists of two 80-ton stacks and a concentrator, with a capacity of from 300 to 500 tons per day. The concentrating machinery was brought from Butte, where it had served in the old Butte smelter. At one time 120 men were employed in the plant, but at the time it closed down only 65 men were working. The original company erected a brick building 60x120 feet, in which it was intended to place refining machinery, but the machinery was never installed. There are several fine residences on the smelter company's ground, which in all includes 140 acres on Pilot bay, about midway between the upper and lower ends of Kootenay lake and opposite the outlet. Considerable money was lost by the company that attempted to operate the smelter, owing to the low grade of the ore of the Blue Bell mine, which is about all it ever treated. On June 19th, '96, the smelter shut down, and since then not a wheel has turned.

(Special Correspondence).—Vancouver aldermen are very timid in considering the numerous smelter schemes laid before them. The statement is made that the promoters of some schemes advanced have been cold blooded bonus hunters whose aim is to secure valuable rights that they might sell them to the highest bidders in England or the United States. The last man who asked for a bonus was Mr. Symons, representing Rothschild and others in England. On being refused he said that his company meant business. They were going to build in September a smelter costing $600,000. There are half a dozen firms figuring on a smelter, but there is little hope of one being built this year.

The Boundary Falls mine will be worked all summer, high values being obtained, but the ore is getting harder and a mill will not be erected. When the railroad being promoted from Columbia river to Penticton goes through the company will be almost able to load ore on to the cars from their dump direct.

The Alpha Bell, adjoining the Golden Cache and containing the same ledge, has struck free milling rock with visible gold on this extension.

On the Surprise claim belonging to this company free milling rock of good quality has also been struck.

The last shipment from the Providence mine, Westminster district, on the edge of Harrison lake, close to Westminster City, yielded returns from the smelter which place the mine on a paying basis at once.

The stock of the Athabasca of Nelson has doubled in value of late owing to the excellent reports received. Eighteen men are working in on the property. Buildings have been erected to accommodate thirty men.

On the northern coast the Blue Bells mine is attracting attention. A shipment was recently made to the smelter which went well in gold and copper. This is good news for the Phillips Arm district where the mine is situated, as the ledge of the property is over 90 feet wide and there is an apparently huge body of ore in sight.

(Special Correspondence).—Rossland is improving in production. Five mines are making shipments—Le Roi, War Eagle, Center Star, Iron Mask and Kootenay & Columbia. This, together with recent transfers, tends towards a firmer feeling. There are plenty of paper companies whose treasury stock has not succeeded in placing their properties on a shipping basis, but their failure is not extraordinary, considering the surface indications.

In Nelson division there has been wonderful activity. The newly recorded locations of this one division amount to over 100 a week. There is a distinct advance in the matter of development and shipment. Heretofore the great and almost solitary mining feature of this division was the Hall mines and their smelter. Trial shipments are beginning to come in from the smaller properties, with fair results, and the common siliceous ores of this section are very acceptable to the local smelter, which is now refining its matte to a value of about 97 per cent copper and a total value of between $500 and $600 per ton. A train load of this product, consisting of 160 tons, went eastwards to England recently.

There is also an increased activity in Ainsworth, owing partially to the closing down of the neighboring Pilot Bay smelter last year.

The divisions of Nelson and Ainsworth adjoin that of Slocan. The mineral bearing country continues without much partiality over the borders of each division, and the rich silver finds of the Kokanee and the gold of the Alpine are on the boundary lines of these divisions along the summit between Kootenay and Slocan lakes.

Concerning the Slocan division, it may be said that there was a slight tendency towards booming it last winter and spring. Prices have been paid too high for legitimate mining. A good deal of property changed hands whilst under the snow. The properties bonded at high figures have in a few cases been dropped. This has left a bad impression with outside investors. The Slocan will continue its course as aforetime after this little adventure, packing out its richest ore in small lots and paving the way towards the time when wagon roads will become a necessity.

A great deal of interest is being taken in the Lardeau country, both from the east by way of Kootenay lake and Duncan river and by way of Arrow lakes and Trout lake from the west. This is a country of great ore bodies and will be a flourishing camp when transportation facilities are much improved. The chief agents of development in this section are the Horne-Payne Company, who are now developing the Broadview, Silver Cup, True Fissure, Old Sonoma and Sunshine, and constructing concentrators at the town of Ferguson, near the junction of the north and south forks of the Lardo.

In Cariboo creek section there is a fair amount of interest and some considerable amount of development going on. Prospectors are working through this range between Slocan and Arrow lakes, but without much result so far.

Several of the old-time Slocan prospectors have returned from Fort Steele and East Kootenay country, stating their preference for the more limited field at home. The ranks of the prospector are grown very large this season. The whole Province promises to be overrun by them; but so far no new fields of especial merit have come into view. However, the rainy weather has almost totally blocked prospecting for the past six weeks.

IDAHO.

G. W. Ruckman has men operating at the Ruckman mine, twenty-nine miles from Huntington, Or., with 7-inch pipe and a hydraulic giant No. 1. He has a current wheel of 12 feet diameter in the Snake river. There is a reservoir 650 feet from the river at an elevation of 100 feet.

Hailey *Times*: Messrs. Anderson and Wickham, chemists of the American Cyanide Company, are at the Camas No. 2 mine to make ready for the new machinery that is coming from California and from Denver. This consists mainly of new bottoms for the tanks and of assay furnaces. To put this machinery in place and to make other preparations will probably take thirty days. The works will continue in operation until freezing weather, as the cyanide solutions freeze at the same temperature as water.

UTAH.

Mercur *Mercury*: Actual work has been commenced on the grade for the Golden Gate mill and the fact has enthused the whole camp. Everything is bustle and activity, the population is increasing by jumps every day, and if there is an idle man in camp it is from choice and not necessity. The *Mercury* last week gave a list of the contracts awarded to that date for the great Golden Gate mill. Since then a number of other important awards have been made, among them one for electricity for motive power, lighting, etc., which goes to Nunn Bros. of the Telluride Transmission Company of Colorado. This company contracts to deliver 300 H. P. by December 1st, and 800 H. P. if desired by Capt. De Lamar. It is understood that the company, which is well heeled financially, will construct a large power plant at the mouth of Provo canyon, and bring in enough electricity over a steel wire or cable to supply not only the large quantity contracted for by Capt. De Lamar, but all the other mines and mills in the district as well, and to furnish light, heat and power for the town also. According to the contract the plant must be in operation by December 1st, otherwise the electric company is to forfeit a large cash deposit. The Messrs. Nunn left for the East at once upon the securing of the contract in order to arrange the preliminaries prior to the commencement of actual work. The contract for the excavation for the mill and the stone work has been let to Rhodes & Thompson, who are to have the site excavated and the masonry ready to support the steel structure in forty-five days from the letting of the contract, and they are to forfeit $250 per day for every day it takes them to do the work beyond that limit. Work was commenced on this contract Sunday, and over 100 men are now at work thereon. The contract for the extension of the railroad was also let to the same parties. The extension starts just this side of the divide and the terminus is at the millsite, above the east shaft. Work was commenced on the grading last Friday, and the branch is to be completed in twenty days from date. From sixty to seventy-five men and twenty teams are employed at present. The mill will be 300 feet wide and 390 feet long. It commences just above the east shaft and continues almost up to the first summit. It will be the biggest mill of the kind in the world, and its construction will alter the looks of all that part of the camp.

MONTANA.

Old-timers say Alder gulch produced $100-000,000 in gold. Virginia City, the old capital of Montana, was located there. It was discovered in 1863, and $30,000,000 in gold was taken out of the sand the first year the mines were worked. In 1866 the Archie McGregor Company secured $2,000,000 in ninety days off of Montana gulch. They bought all the beer kegs there were in the country, put the gold in the kegs, hired twenty men with Henry rifles, built Mackinaw boats and floated down the Missouri river. Last Chance gulch, where Helena is situated, for many years never failed to take out as much wealth as the entire Alaska country has so far taken.

The *Inter-Mountain* says the Gold Ring claim at Butte, adjoining the Mayflower on the northwest, has been leased and bonded to M. Wetzstein and Lee Eisenberg of Livingston for $150,000, of which it is said $2000 was paid down. It is supposed that the deal was made in the interest of W. A. G. Berkin and other English capitalists who recently took a lease and bond on the Sunrise and Celebration claims for $100,000.

The *Miner*, referring to the Blue Bird property, says it is rapidly being dismantled and everything of value that is portable is being carted away. The Boston & Montana Co. recently purchased the immense gallows frame and an agent of the concern has been busy for several months disposing of all machinery and loose material about the plant.

The Boston & Montana Co. has a force of about eighty men employed at the Anderson mine and some extensive drifting is being done along an ore body which was exposed before the bond and lease was secured.

At a depth of 1500 feet in the Bell shaft of the Anaconda mine, the miners are engaged in breaking down ore from a ledge of copper glance running as high as 75 per cent in copper and very high in gold. It is said that a great deal of this ore is sacked and shipped direct to the Eastern refineries.

SOUTH DAKOTA.

Rapid *Journal*: A rich pocket was struck in the bottom of the main shaft in the Keystone mine Friday, about 2 feet thick and the ore, it is claimed, was fully one-half gold.

COLORADO.

A stamp mill with 100 tons capacity is to be built in High Park, four miles from Cripple Creek, by a Chicago syndicate. B. I. Brooks will be in charge. There is supposed to be an immense amount of low-grade ore there.

The Consol company at Summitville has the machinery for the mills. The *Prospector* is told by Superintendent Kirby that it will take $100,000 to put the property in shape.

Republican: The expenditure of $1,000,000 in the construction of new railroads for the Cripple Creek district is in these days of general stagnation in railroad building a sign of the times that indicates the confidence the camp has won among capitalists. The Cripple Creek District Electric Railroad has placed its $500,000 bonds, which guarantee its completion, and the work of grading and track laying is already well under way. The girders are circling Gold hill from Poverty gulch at a rate that promises that cars will be run before the end of the year. A contract for a large section of the electric railway from Canyon City has been let, and those familiar with the business arrangements of the promoters say that the money necessary for its construction and equipment has been raised. In addition to these surface roads, the announcement by the projectors of the Pike's Peak mining and railway tunnel that they have raised a guarantee of $12,000,000 in London for their enterprise seems to indicate that the fame of Cripple Creek is sufficient to draw capital from its hiding.

The district in and around Georgetown and Silver Plume is showing up well in gold. In the celebrated Griffith mine, the workings of which are almost within the corporate limits of Georgetown, lessees are working on a vein of solid iron and copper pyrites 15 inches in thickness. A mill return of two carload lots of twenty-four tons each returned as follows: One carload returned 3¾ ounces gold, 58 ounces silver, 6½ per cent copper and 18 per cent lead to the ton; the other carload, which was taken from another portion of the vein, returned 2¾ ounces gold, 61 ounces silver, 7 per cent copper and 20 per cent lead to the ton. On the Georgetown tunnel level there is a large body of ore disclosed for several hundred feet, which runs well in gold. As depth is obtained on this famous property the gold values seem to increase. On the Hood, which is a continuation of the Griffith, a mill run was had that returned 8 9-10 ounces gold to the ton.

At Silverton Grabowsky, who purchased the Fisher mill, will have the necessary machinery to put the mill on a modern working basis and has men clearing out the flume and putting the buildings in repair. The old overshot wheel is to be supplanted by a turbine motor, which is expected to double the power and afford sufficient power should Cement creek get low in the fall. The mill is situated about two miles from Mr. Grabowsky's mines, but as it is a down hill pull the quartz can be delivered for $1 per ton. The Gold Tunnel & Railway people have ordered their plant of drilling machinery and ground is being excavated for the tunnel buildings. The Sampson has repaired the old Huson tramway and the management declares it to be as good as new. The boarding house and mill buildings, that during years of idleness had become very dilapidated, have been repaired and everything is ready for new machinery. A force of men has started a shaft in the lower level of the mine, and will push it down 100 feet. The ore taken out will be stored at the mill until it is ready to run. It is not known whether the mill will be started this season or not, as the company propose to spend their money first on development. The smelter, which has been shut down for repairs for the last two weeks, will blow in next Monday. During the interval many train loads of sulphide ore have arrived from Red mountain, and all the bins are choked with mineral.

NEW MEXICO.

The Mills Tunnel Company has incorporated in Santa Fe; T. B. Mills, Las Vegas; G. A. Rothgeb, Elizabethtown; D. B. Merry, Victor, Colorado; J. H. Thompson, Bucyrus, Ohio; O. B. Steen, Denver, Colorado; to do a general business in mining and milling ores and buying and selling mines and smelting, operating the same, etc.; capital stock, $1,000,000; principal office, Elizabethtown, Colfax county.

It has been definitely decided that an ore purchasing and sampling works will be established at Algodones, and the cash for this enterprise has been deposited. The capacity of the works is to be 100 tons a day, and the machinery and lumber for the same are to be on the ground within ten days, providing accommodations can be had from the railroad company. The sampling works will turn the line of travel and ore to Algodones, so that when a smelter is established the first 100 tons or so of ore can be supplied from the sampler.

New Mexican: Since the sale of the placers between Hillsboro and Kingston there has been a noticeable increase in the operations in that district. Prospectors are finding their way into the hills and are working with good results. The deposits in the Mimbres mountains are an immense fissure in a porphyry formation, the ores bearing gold, silver and copper, the greater part being free milling.

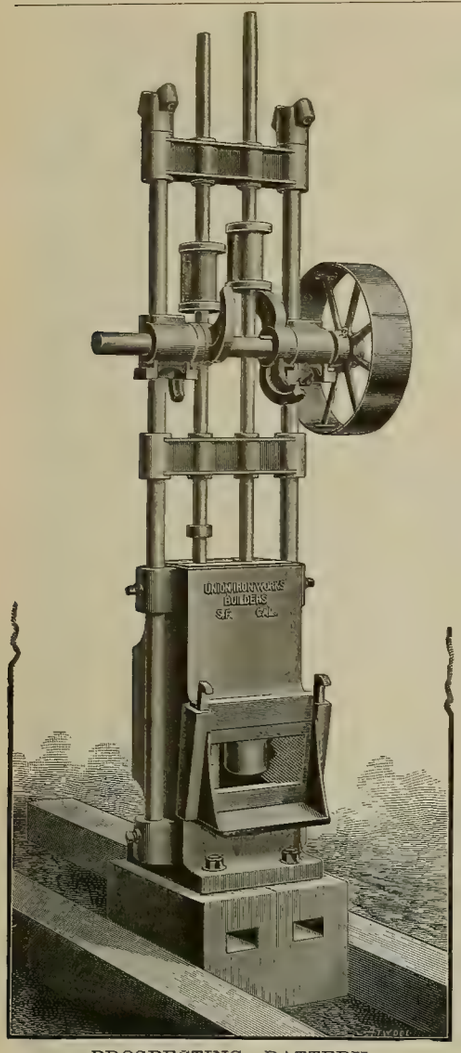
Near Grafton considerable development work has been done, the ores found in that vicinity being in a lime quartz and are free milling. The principal properties in this district are the Great Republic group, Emporia and Ivanhoe, all patented and having from 500 to 1000 feet of work done on each. The ores are rich in gold and easily treated.

ARIZONA.

Four gold quartz claims in Peoples Valley, thirty miles from Prescott, have been sold by Sinclair and Walloth to Dr. Underwork of San Francisco for $20,000.

MEXICO.

Pittsburg capitalists have organized the Mexican Sulphur Co. and under a concession from the Mexican Government will develop sulphur deposits in the Cocopah country and ship the product to the United States.



PROSPECTING BATTERY.

UNION IRON WORKS,

222 Market Street, San Francisco, Cal.

THIS : :

Two-Stamp Self-Contained Battery

IS DESIGNED BY

THE UNION IRON WORKS

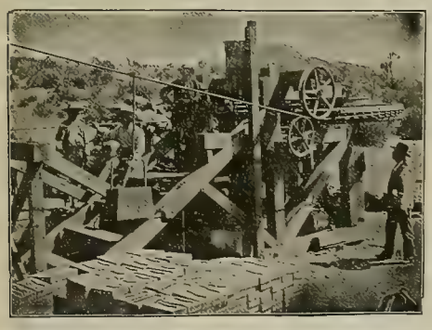
Expressly for Prospecting Work.

It was awarded First Prize at the recent Mechanics' and Manufacturers' Fair, where it was in daily operation, crushing ores from various mines throughout the State.

Weight of stamps, 275 pounds each; capacity of battery, determined by actual work, 200 pounds per hour, through a No. 7 slot-punched screen.

Entire battery weighs about 3000 pounds; heaviest piece, mortar, weighing 1200 pounds.

Can be taken apart and transported to any locality.



THE HALLIDIE ROPEWAY

Stands pre-eminent for the transportation of Ore, Fuel and other materials over mountainous and rugged country.

Parties desiring to remove large quantities of Sand, Gravel, Earth, Ore, Rock, to construct Dams, Levees or Embankments, etc., can do more efficient work at less cost by the

Hallidie System of Ropeway Transportation

Than by any other known system.

Coast Industrial Notes.

—Numbers of four-legged mules are being shipped to the Klondyke from California.

—Fontana & Son of San Francisco are this week canning cabbage for the Uitlanders in Alaska.

—About 250 shingle mills in the State of Washington are working at full capacity to fill Eastern orders.

—There is now long distance telephone communication between San Francisco and San Diego, Cal., over 600 miles.

—The California Asphaltum Company at Ventura made its first shipment of asphaltum last week to Alleghany, Pa.

—The salmon run in the Fraser river is phenomenal. Canners are refusing to accept salmon offered at 3 cents each.

—The Alaska Development Company has been organized at Seattle, Wash., to develop the coal and oil fields lately discovered in southeastern Alaska.

—The India Rubber Comany of Mexico, an English corporation capitalized at $2,000,000, is planting 5,000,000 rubber trees on its property at Pochutta, Mexico.

—Statistics compiled by the Mexican Government show that foreign capital invested in Mexico in the last four years amounts to 1,000,000,000 Mexican dollars.

—The Klondyke craze has sent up the local prices of provisions and created a "boom" in all manner of transportation to go north and freeze up with the country.

—Eastern Oregon, it is estimated, will this year produce 11,500,000 bushels of wheat, western Oregon about 6,500,000, a total of 18,000,000 bushels for that State.

—The Sumpter & Bourne Railway Company, $100,000, has incorporated to build a railway in Baker county, Oregon, having terminals at Sumpter, Bourne and Cable Cove.

—Only thirty Victoria, B. C., sealing schooners will go to Behring sea this season, compared with sixty-four last year. The low prices for last year's catch is the cause.

—Twenty-three miles of the Sierra Railroad from Oakdale toward Angels, Calaveras county, Cal., are finished. The road is to be 124 miles long and is bonded for $3,720,000.

—The Carson and Colorado railroad is 307 miles long. In 1896 the only portion earning anything was that part of the line in Nevada. The net earnings last year were $17,187.32.

—Fifteen hundred and twenty-five men working fifty-five hours a week, with a payroll of about $75,000 a month, is the showing made by the Santa Fe shops in Topeka at the present time.

—At the S. P. Co.'s Sacramento shops are being built sixty-four vestibule passenger cars, sixty-four vestibule baggage cars, 150 standard box cars and thirty thirty-ton hopper bottom coal cars.

—The Los Angeles City Water Company has offered to sell its plant to the city for $3,000,000. The city engineer reports that the value is $1,190,000, which sum will be offered by the city for the plant.

—During the first half of 1897 ninety-two miles of new railroad track were laid in California, this State standing second among the States in this regard. The estimated total mileage of new road constructed in this country during 1897 is 2000 miles.

—The Klondyke boom has been of value to all dealers in supplies. More especially is it noticeable in the hunting up of every old and new water craft along the coast. Vessels idle for years are being put in more or less seaworthy trim for the Alaska trip.

—The Comliebank, 2,719 tons register, and the Cressington, 2,660 tons, will carry wheat from San Francisco to Brazil, the first time in history that a cargo of this kind has gone from here to that part, Brazil having always depended upon Argentine for its wheat supplies heretofore.

—P. L. Packard and William A. Pratt of Wilmington, Delaware, have gone to Juneau, Alaska, where they head a party which will survey a pass from Taku Inlet on the Alaska coast to Testin lake as a railroad route for transporting miners and supplies into the Yukon territory.

—J. E. Terry, the recent purchaser of the Shasta Lumber Company's property in Shasta county, Cal., says the works are in active operation. The mill at Round mountain and the lumber camps supplying it employ about 125 men. On the twenty-seven miles of flume and at Bella Vista sixty more men are at work. The mill will cut 50 M feet daily.

—The Atchison Railroad Company will construct two 50,000,000-gallon reservoirs by damming canyons in the Arizona desert twelve or eighteen miles distant from the railroad, at a cost of $290,000. The water will be piped to the railroad. The interest on the cost of the reservoirs will be about a third of the present cost of hauling water to the tanks which they will supply.

—The Mexico, Cuernavaca and Pacific railroad construction work is being pushed. The road will be completed and in operation to the City of Mexico within three months. Nearly 5000 men are at work in the different construction camps. This will be the first transcontinental railroad in Mexico north of the isthmus of Tehuantepec. Its objective terminus on the Pacific coast is the port of Acapulco.

—The contract for the work of excavation and putting in the sub-foundation for the postoffice building at San Francisco goes to the San Francisco Bridge Company. The bids received and opened in Washington were as follows: San Francisco—Matt McGowan, $37,900; George Goodman, $41,277; J. W. McKay, $46,400; Thomas Butler, $38,898; R. A. E. Building and Construction Company, $39,990; Warren & Malley, $38,792; San Francisco Bridge Company, $36,830. Oakland—Cotton Bros. & Co., $41,998; Warren B. English, $48,868; California Bridge and Construction Company, $57,273. Chicago—L. L. Leach & Sons, $47,985. The successful bidder is to complete the work in four months.

—A. A. Dougherty has returned to Los Angeles from New York, where he delivered $250,000 worth of bonds of the Randsburg railway to the Rochester Trust Company and secured therefor the necessary funds to build the line. The work of construction will begin at once at Kramer, a station on the Santa Fe & Pacific, and will be completed to Randsburg in ninety days. Traffic arrangements have been completed with the Santa Fe.

—The Los Angeles *Times* reports the local fuel oil market showing some improvement. During last week 10,000 barrels were shipped to San Francisco, and it is claimed that this shipment will soon be followed by an equal amount. Prices are advancing toward the dollar mark, and producers claim that they will soon be receiving this price for their output. A few of the heavier producers depreciated the shipment of any oil to San Francisco, declaring that it will all be needed at home. Nobody has taken hold of the matter, but they favor the storage of from 50,000 to 100,000 barrels in iron tankage, and assert that had they this amount in such tankage at the present time the Southern Pacific railroad would take the entire amount off their hands at $1 per barrel. They add the interesting information that just prior to the recent heavy advance in oil that company was getting ready to use crude petroleum and had, in fact, changed one of its locomotives to an oil burner, and asserted that it was willing to pay $1 per barrel for oil in large quantities, but when the price was advanced to points ranging from $1.40 to $1.60 per barrel, orders were issued from headquarters to change no more engines and return to the use of coal, which was done. The sugar factories at Alamitos and Chino are beginning to draw upon the southern California oil fields for fuel supplies. It is said these factories will consume from 140,000 to 150,000 barrels during the next four months, a considerable quantity of which is suitable for refining purposes. Through the operations of leading oil men and the increase of production, refineries, distillating plants and asphaltum works have been established, and the users of motive power have been won over to the superiority of oil as a fuel, thus opening up along these lines a broad field for its consumption.

—The Dingley tariff bill passed the Senate last Saturday, has been signed by the President and is now a law. At no point in the measure is California forgotten or forced to be content with less protection than the industries deserve. Throughout the bill there is a spirit of protection to American industries, and the Pacific coast shares as it should in every point. No more favorable point was made than the placing of citrus fruits at 1 cent a pound, though the victory in the classification of Zante currants at 2 cents a pound will work almost as great good to the State's interest. On nuts there was a general advance made in the conference report. Almonds are placed at 6 and 4 cents for shelled and unshelled, and filberts and walnuts at 5 cents and 3 cents in the same condition. On apples and other deciduous fruits, 25 cents a bushel is the duty rated, with 2 cents a pound when dried. On still wines, the figures are a compromise, 40 cents a gallon being settled upon. Brandy was put at $2.25 a gallon. On olive oil there was a decided victory when 50 cents a gallon was secured, as was the gaining of 10 cents a pound on mustard. The jute schedule was one on which there was a great fight, and while the rates of the House bill were reduced 5⅞ cents a pound and 15 per cent ad valorem on both burlaps and grain bags, these are considered sufficient to guarantee the continuance of both manufacturing interests on the coast. The restoration of a $2 rate on white pine means much for the sugar-pine producers, while the duty on borax and quicksilver will give new life to them. The rebates granted on the tin manufactured into cans for fruits and salmon, and the rebate on coal used in ships in the foreign trade or plying between the Atlantic and Pacific coasts, will have a beneficial effect on the shipping interests. The sugar schedule is considered by those interested in the development of the beet-sugar industry as most favorable, and should the Senate do as it promised—give a bounty of one-quarter of a cent in winter—the conditions will be right for a great impulse being given to the interest.

Recently Declared Mining Dividends.

Kearsarge, Mich., Copper M. Co., $1 per share; payable August 10.

Homestake Mining Co., South Dakota, 25 cents per share, $37,500; July 26th.

Central Lead Co., $4000; July 31st.

Mercur, Utah, mine, $25,000; July 21st; $750,000 to date.

Portland, Cripple Creek, Col., $30,000; July 15th.

Gold Coin, Colorado, 5 cents per share, $10,000; payable Aug. 2nd: $150,000 to date.

Personal.

E. W. FOX has been appointed Land Office Registrar at Clayton, N. M.

THOS. COUCH has left Coulterville, Cal., and is at present in Salt Lake City, Utah.

A. CRISMON of Salt Lake is the new assayer at the Mammoth mill, Mammoth, Utah.

R. H. POSTLETHWAITE is superintending the construction of a new style river dredger at Smartsville, Cal.

P. J. CIRKEL, superintendent of the Yellow Jacket, has returned to Salmon, Idaho, to reopen the mine.

WM. CRAIB of Oakland, Cal., has bonded the Kreger and Vaughn mine, Amador, Cal., and will work it.

M. C. IHLSENG of State College, Pa., who been examining the Tres Amigos mine, Oro Blanco, Arizona, has returned home.

JAS. O'BRIEN, of Smartsville, Cal., has been re-elected superintendent of the Marysville & Nevada Power & Water Company.

GEORGE W. DICKINSON, formerly general manager of the Northern Pacific railroad, has gone into mining, and is now one of the Clark syndicate of Spokane, Wash.

F. W. BRADLEY, superintendent Bunker Hill and Sullivan, Idaho, mines, is visiting San Francisco. He has been examining some mining property in Placer county.

J. E. POINGDESTRE, manager Good Title mine, at Dobbins Ranch, Yuba county, Cal., is in the city to buy a 10-stamp mill. H. Pengelly succeeds J. J. Dailey as superintendent.

CAPTAIN J. R. DELAMAR and Manager H. A. Cohen arrived at DeLamar, Nevada, one night last week, having made the drive from Milford, Utah, a distance of 160 miles, in fourteen and three-quarter hours.

MESSRS. HUGHES, Mumford, VanDye and Professor Price of San Francisco are visiting the Garnett Consolidated mine, Plumas county, Cal. Mr. Hughes is president of the Garnett Company, and Mr. Mumford, secretary.

BENJ. J. HALL, one of the proprietors of the Pioneer Reduction Works, Nevada City, Cal., goes to Douglas island, Alaska, where he will relieve Emile Ott, in charge of the chlorination works of the Treadwell mine, who takes a ninety days' vacation.

THE position of assistant general freight and passenger agent of the Santa Fe Pacific Railroad at San Francisco is abolished. H. C. Bush is appointed general agent, freight department, and John L. Truslow general agent, passenger department, with headquarters in San Francisco.

JNO. D. MCGILLIVRAY of the MINING AND SCIENTIFIC PRESS goes to Alaska to report on the Klondyke mines under the auspices of the New York *Herald* at a princely salary. And this little personal calls to mind how many clever men have gone out of the editorial rooms of the MINING AND SCIENTIFIC PRESS as mining authority to all parts of the world. Indeed, it has come to be recognized that one of the certainties of an editorial position on this paper is a speedy selection to do expert work at a fee enormously in advance of what can be afforded in the ordinary daily humdrum routine of journalistic work. A year ago the then editor of this paper was offered and accepted, with the consent of the proprietors, a very large sum to make expert report on the Siberian placers, and now his successor goes to Alaska at an equally remunerative rate. And so it has been through the years. Scattered everywhere that gold is mined all over the world are men who once worked in this office, and the writer is glad to say that with one and all are maintained towards this paper friendly feelings and kindly relations undimmed by the passing years.

Recent California Mining Incorporations.

White Peak Group M. Co., Los Angeles; J. W. Wenzel, M. L. Wicks, R. H. Bradley, C. McComas, J. J. Smiley; capital stock, $1,000,000; $500 subscribed.

Naples M. Co., Santa Barbara; H. W. Mazzall, E. W. Hayward, H. C. Booth, J. R. Thermond; capital stock, $50,000; $6000 subscribed.

Franco-American M. Co., Los Angeles; F. Colas, A. L. Appfel, E. E. Lefebre, W. F. Botsford, A. B. Dessevy, W. Declez; capital stock, $100,000; $68,780 subscribed.

The Red Fox M. Co., S. F.; C. W. Mariatt, E. L. Snell, J. O. Weinstrom and A. Lind. Capital stock, $30,000; $85 subscribed.

El Dorado Con. G. M. Co., Angel's Camp, Cal.; M. Arendt, P. Johnson, D. C. Demarest, E. F. Hubler, G. F. Pasha, W. A. Bisben. Capital stock, $200,000; subscribed, $1700.

Commercial Paragraphs.

THE Mine and Smelter Supply Company of Denver, Colorado, have a contract for a double tramway 8500 feet long for the Montezuma Mining Company, nine miles from Kaslo Creek, B. C. The E. P. Allis Co. have a contract for a 100-ton concentrator. The cost of the whole will be $46,000.

JAMES LEFFEL & Co., Springfield, Ohio, have issued a neat, new Pamphlet "D," replete with numerous illustrations and descriptions of the throttling and automatic engines, with portable and stationary boilers, which they are building in a variety of sizes and styles. A copy is sent free to parties interested on application to the company.

THE Central London Underground railway has recently contracted with the Edward P. Allis Company of Milwaukee, Wis., for six cross-compound condensing Reynolds-Corliss engines, each of 1300 nominal horse power. Each engine is to have cylinders of 23 and 46 x48 inches, and will make 100 revolutions per minute. The shipping weight of each is about 300,000 pounds. They will be directly coupled to electric generators. Four similar engines are to be sent to the Government tramways of Sydney, N. S. W.

Valuable Silver and Lead Mining Property for Sale.

The property is known as the **Montezuma Silver Mining Co. of Utah;** is situated on the Little Cottonwood, Alta, Utah, comprising the "Montezuma," "Savage," "Hiawatha" and "Last Chance" locations, also the "Buckland" tunnel, 1500 feet long, and over it the "Savage" tunnel, 800 feet long, with openings connecting the tunnels. The mine is in good working order, with considerable ore in sight. The ore is rich in lead and in good demand by the smelters. For terms and any other information, address David R. Pierce, Sec'y and Treas., 210 West Larned St., Detroit, Mich.

WANTED.

Able, rugged man, as Roaster, thoroughly familiar with oxidizing dead roast of gold concentrates in Bruckner furnace. None other need apply. Address quickly, stating experience and qualifications.

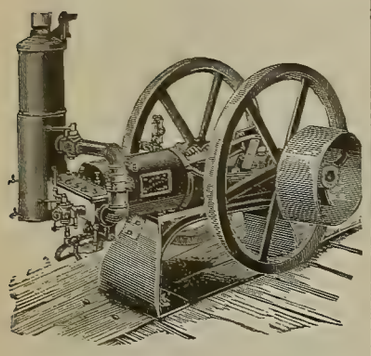
Cheap Power!



SAVE MONEY BY USING

—THE—

"DANIEL BEST"

Crude Oil Engine.

This Engine can be operated on either Crude Oil, Distillate, Gasoline, or Kerosene. **It is the cheapest power on earth** and is not tied to any one kind of Oil, but can use any kind that will make gas and is not handicapped by being compelled to use a certain Oil. Do not forget this when in need of an Engine.

We guarantee our Engines to work perfectly on California Crude Oil, or Distillate, or any other kind of gaseous Oil; we however prefer CALIFORNIA CRUDE OIL, from Coalinga, Fresno county, for the reason that gas from Crude Oil will produce more power from the number of feet of gas used than from any other Oil, and it is also a natural lubricant as well, the valves being always lubricated sufficiently to prevent them from sticking, thus assuring greater durability of the working parts than it otherwise would be in using dry gas. And another advantage we claim is, that danger from explosions is reduced to a minimum, there being no accumulation of gas, but is used by the Engine as fast as it is generated and hence is absolutely safe. The following is a test that we made with one of our Five-Horse Power Crude Oil Engines, running ten hours on the different gas oils:

California Crude Oil,	40 grav.,	7⅛ galls. at	5c..	$.37½
Distillate	40 "	7⅛ "	5c.,	.80
Domestic Coal Oil	40 "	7⅛ "	12½c.	.83¾
Gasoline	74 "	8¾ "	15c.,	1.31¼
City Gas		1000 feet.		2.00

We manufacture all sizes from two-horse power up, and will guarantee that our Engines will run cheaper and are more simple in construction, have fewer parts and hence are more durable than any other Gas Engines on the market. Seeing is believing; don't take our word for it, but come and investigate for yourselves. You can always see one in operation at our works. We will be pleased to see you and will at all times take pleasure in showing them up. Our Engines are specially adapted for running well and mining machinery—in fact, for any kind of power desired. We are the pioneers and first inventors of Crude Oil and Distillate Engines. **We always lead and never follow.** Send for Catalogue and Price List of the only genuine Crude Oil and Distillate Engine made.

In the Superior Court of the City and County of San Francisco, State of California, Department No. 8. John V. Kimball, plaintiff, vs. Mabel L. Kimball, defendant. Action brought in the Superior Court, City and County of San Francisco, State of California, and the complaint filed in said City and County of San Francisco, in the office of the clerk of said Superior Court. The people of the State of California send greeting to Mabel L. Kimball, defendant. You are hereby required to appear in an action brought against you by the above-named plaintiff in the Superior Court, City and County of San Francisco, State of California, and to answer the complaint filed therein within ten days (exclusive of the day of service) after the service on you of this summons, if served within this county; or, if served elsewhere, within thirty days. The said action is brought to dissolve the bands of matrimony now existing between yourself and plaintiff, on the ground of habitual intemperance on your part for more than one year past. All of which will more fully appear in the complaint on file herein to which you are hereby referred. And you are hereby notified that if you fail to appear and answer the said complaint, as above required, the said plaintiff will apply to the said Court for the relief prayed for in the complaint. Given under my hand and seal of said Superior Court at the City and County of San Francisco, State of California, this 9th day of April, in the year of our Lord, one thousand eight hundred and ninety-seven. C. F. Curry, Clerk. By Joseph Riordan, Deputy Clerk. R. Thompson, Attorney for Plaintiff.

Springer Ore Concentrator,
Truax Ore Cars,
Rock Breakers, Hoists, Etc.

Why the Springer Concentrator is the Best:

It will do more and cleaner work than any rubber belt machine.
It weighs only one-half as much as some of the six-foot concentrators.
Is the most simple in its construction of any machine in the market, and only one-third as many pieces in it as in some of the others. Was invented by an old miner of forty years' experience handling every known concentrator on the market.
Should any piece need repairing, it can be removed without disturbing any other part of the machine.
Can be set up by any inexperienced miner.
Its distributor is perfection itself, distributing the pulp evenly over the entire surface of the belt.
Grade of shaking frame can be changed while the machine is running at full speed.
It is the strongest, lightest running and most inexpensive to keep in repair of any
Will save more of the fine slimes than any other machine.
Is cheaper than any other six-foot machine, costing only $350.00 f. o. b. cars or boat, San Francisco.
Will handle the pulp from five stamps better than any other Concentrator.
Has adjustable eccentrics, and any length of stroke can be had, thereby giving different speeds per minute.
The belt is very durable, being made of No. 3 Canvas, woven especially for the Springer concentrator.
This machine requires so little attention that one man will easily attend to a dozen of them.
It has a solid rubber flange, which no other canvas belt has.
Wear and tear upon this machine is not one-third as much as upon some of the other concentrators.

The Mine and Smelter Supply Co., Denver, Colo.

THE LARGEST STOCK OF MINING, MILLING AND SMELTING MACHINERY WEST OF CHICAGO.

PIPE, PACKING, RUBBER BELTING, AND SUPPLIES OF ALL KINDS.

SOLE AGENTS FOR **WILFLEY CONCENTRATING TABLE,**

And claim for it BETTER work than any Concentrator made, with a capacity of from 15 to 25 tons per day of 24 hours. It is simplicity itself. No moving belts or intricate parts. Any one can learn to operate in an hour.

For confirmation of all of the above we refer to Henry Lowe, Puzzle Mine, Breckenridge, Col.; Mary Murphy Mine, St. Elmo, Col.; W. E. Renshaw, Mayflower Mill, Idaho Springs, Col.; H. E. Woods, Denver, Col.

WILFLEY CONCENTRATOR.

FINCH & CAMPBELL, GENERAL MANAGERS. WALLACE, IDAHO, June 18, 1897.

The Mine and Smelter Supply Co., Denver, Colo.—GENTLEMEN: Replying to your favor of the 8th inst., regarding my experience with the "Wilfley Concentrating Table," will state that in February last I placed in the vanner room of the Standard mill one of your tables, which has been in constant use every day since. It has been operated by the usual attendant of the vanners and has been given no special attention, and has been supplied with the same "feed" as the Frue vanners and at the end of each day's run has shown lower tailings than the vanners and produced from three to four times the quantity of concentrates of the same value per ton as any of the Frues. We have three more of the Wilfleys in the same mill, which are all doing splendid work and handling fully twenty tons each per day of silicious ore carrying about 10 per cent lead and 12 ounces silver. They are all making a remarkably close saving of values and giving the most perfect satisfaction. A very fair opportunity is offered in this mill for comparing the work of different concentrators, as we are using Harz jigs, Collom jigs, round buddles, Frue vanners, and Wilfley tables, and handling nearly 500 tons of crude ore per day, and all of the machines are given the class of work for which they are best adapted. I can heartily recommend the Wilfley to any one needing a concentrator for fine ores.
Yours very truly, EMERSON GEE, Manager Standard Mining Co.

These Tables have displaced belt tables of almost every make, as is shown by letters in our possession.

PRICE, $450.00.

Market Reports.

The Markets.

SAN FRANCISCO, July 29, 1897.

The rush of goods to Alaska has been something phenomenal, particularly the kinds suitable for prospectors who are seeking that country by thousands. The regular fall trade has not set in yet, but it is expected to begin within a fortnight. The general belief is that there will be a larger volume of goods going out than for several years past. Manufacturers report active work, with orders ahead. There is an improved inquiry for mining machinery, with figures being made on several. A 250-stamp mill is to be erected at or near Juneau. Whether the contract for the plant will be let here or at the East is not as yet decided. It is stated that other mining machinery will be required for Alaska next year, including that for a copper mine. The tariff bill becoming law is a source of satisfaction, owing to the uncertainty giving place to the certainty.

The local money market is still working easy, with the tendency in favor of borrowers. The banks do not appear to be so exacting in securities. This change has been brought about by a higher and active market for farm products, an improving market for fruits, and the gold mining industry still forging ahead. The mines in this State are giving employment to a very large increase in the number of hands, while the output is considerably in excess of last year. The demand for funds shows a steady increase. It is for crop-moving purposes. Freer advances are being made on grain than had been looked for, owing to farmers not being disposed to let go much as yet. New York advices state that the heavy demand for money with which to pay duties has not had any influence on that market, owing to the very heavy supply of available funds. The banks and trust companies were making call loans at the rate of 1 to 1¼ per cent per annum, and even at these exceptional low rates the demand was light. With the movement of crops, grain, cotton, etc., an increased call is looked for. Some gold has been exported to Europe. It is believed that more will follow.

New York Silver Prices.

NEW YORK, July 29.—Following are the closing prices for the week:

	Silver in London.	Silver in N. Y.
Friday	27 5-16	59¾
Saturday	27½	59⅛
Monday	27 3-16	59
Tuesday	26⅞	58¾
Wednesday	26⅜	57¾
Thursday	26 7-16	57⅛

	Copper.	Lead.	Iron.	Tin.
Fri.	11 00 @11 20	3 85	10 00@12 00	13 80
Sat.	11 00 @11 20	3 85	10 00@12 00	13 75
Mon.	11 00 @11 20	3 82½	10 00@12 00	13 75
Tue.	11 00 @11 20	3 85	10 00@12 00	13 70
Wed.	11 00 @11 20	3 80	10 00@12 00	13 70
Thur.	11 00 @11 20	3 80	10 00@12 00	13 70

The local bullion, money and exchange quotations current are as follows:

Commercial Loans, % per annum	6
Commercial Loans, prime	5
Call Loans, gilt edged	4@4½
Call Loans, mixed securities	5@6
Mortgages, prime, taxes paid by lender	6@8
New York Sight Draft	12½c Prem
New York Telegraphic Transfer	15c Prem
London Bankers' 60 days	$4.87
London Merchants	$4.85
London Sight Bankers	$4.88
Refined Silver, per oz., 1000 fine	57½
Mexican Dollars	46½

SILVER.—The market broke the past week 15-16d in London and 2 cents in New York—carrying prices to the lowest figure on record. In 1894 it sold at 27d in London, but recovered and sold at quite an advance on this figure. At this writing it is hard to get accurate information on the situation, but from all that can be learned it looks very much as if India's wants are being met largely from China. It is quite possible that Russia is back of it, and while China gets the name Russia is playing the game. The low prices have not so far had any appreciable effect on the export movement from New York, for it holds as strong as ever.

The steamer Doric, hence July 27, took out $137,000 of silver for Bombay, but none for China.

MEXICAN DOLLARS.—The market has been somewhat demoralized, falling to 46½ cents, but at the close it is stronger. It is said that at the lower prices there was considerable buying. The steamer Doric, hence July 27, took out 257,146 for China. Eastern advices report free shipments from New York

QUICKSILVER.—The market is steady, with only a fair call reported.

Our market is quoted at $40 for domestic consumption.

COPPER.—The market has held to steady figures throughout the week. At the close our advices from New York report a strong market there and in Europe.

Lewis & Sons of Liverpool, in their last circular received, report: For refined copper, especially high conductivity wire bars, there has been considerable inquiry from the Continent, where the consumption continues very large. Trade is improving in the United States, and should this lead to an increased home consumption of copper, as is expected, exports may fall off materially. The increased American production of 3700 tons for the five months ending May has been exported, showing no increase in American consumption, which last year was about 11,000 tons less than during 1895. Even with these increased receipts from the United States English and French stocks have decreased 3240 tons during the past half year. Imports are 8251 tons greater, and deliveries 696 tons less, to date than during the same period last year. The total arrivals in England and France for the month have been 11,134 tons, and the deliveries 12,270 tons fine. Stocks have decreased 1251 tons, and the visible supply 1076 tons.

The local market is quoted as follows:

Ingot casting, jobbing	13@—
Ingot " wholesale	12½@—
Sheet copper	—@16½
Bolt	¼ and 5-16, 20c; ⅜ and larger, 16½

TIN.—The market for pig at the East is weaker towards the close, but this was looked for owing to a falling off in the demand. Our market is unchanged, with the tone easier.

The market is quoted in jobbing lots as follows:

Pig, per lb., jobbing	—@ 15
Plate, I C coke, heavy, per box	$4 10@4 25
" " " light, "	4 00@—

LEAD.—The market has held fairly steady at the East, owing to refiners' indifference as sellers. It is quite evident that the tariff of 1½c, instead of ¾c, per pound on all lead in silver ore has not had any effect. It must have been discounted.

Our market is quoted in jobbing lots as follows:

Pig	— @ 4 50
Bar	— @ 4 60
Sheet	5 75 @ 6 00
Pipe	5 00 @ 5 25

SHOT.—The market is steady to firm. Sales are increasing.

Our market is quoted as follows:

Drop, sizes smaller than B, per bag of 25 lbs	$1 35
Drop, B and larger sizes, " "	1 60
Buck, Balls and Chilled, do, " "	1 60

POWDER.—The market is steady.

The market is quoted as follows for Hercules: No. 1, from 11¾c to 17½c, according to strength and quantity; No. 2, from 9c to 11c, according to strength and quantity.

IRON.—Imports have been quite heavy, but stocks do not show any increase owing to heavy consumption. The East reports large consumption and a free export movement, but liberal supplies keep prices steady.

AMERICAN.

	To Arrive.	Spot.
Sloss	$20 00	$22 00
Thomas	21 00	22 00
Salisbury	29 00	31 50

ENGLISH.

Barrow	$21 00	$23 00
Gartsherrie	21 50	23 00

COAL.—The market seems to have a slightly firmer tone owing to the increased duties—now 67½ cents a ton on bituminous—being in effect. Collector of the Port Jackson issued the following letter to the deputy collector July 27: "In view of the standard fixed by the new tariff of 92 per cent of fixed carbon as the line of demarkation between anthracite and bituminous coal, you will exact a deposit on all cargoes hereafter passed as anthracite from Swansea."

We quote as follows:

SPOT FROM YARD—PER TON.

Wellington	$8 00@— —
Greta	6 00@ 6 50
Nanaimo	6 50@ 7 00
Gilman	5 50@ 6 00

English, to load	9 50	@	— —
" spot, in bulk	10 00	@	— —
" in sacks	11 00	@	12 00
Cumberland	— —	@	— —

ANTIMONY.—The market is steady.

Our market is quoted at 7⅛@8¼c in a jobbing way. New York mail advices quote 7½c for Cookson's, 6⅞@7⅛c for Hallett's and 6⅞@7c for Japanese.

NAILS.—The market is lower and active.

Wire, carloads, basis per keg	
" jobbing, " "	$2 15
Cut, carloads, " "	
" jobbing, " "	2 05

BORAX.—The market is steady.

The market is quoted as follows:

Refined, in carload lots, in barrels	5
Refined, in carload lots in sacks	4¾
Powdered, in car lots	5
Concentrated, "	4¼

PLATINUM.—The market is quiet.

Our market is quoted in a jobbing way at $15 per ounce and for scrap $10 an ounce.

ZINC.—The market is steady.

Our market is quoted at 10 to 15 cents, according to thickness.

ALUMINUM.—The market is steady.

We quote in jobbing lots at 45 to 50 cents per pound for ingots.

Chemicals.

With the tariff bill law, there seems to be more disposition on the part of importers to advance prices, but liberal stocks here and dealers carrying good lines are against it at this writing. It is expected that changes in quotations will be made in a few days in chemicals most affected by the new tariff. The East does not report any material changes. One cargo of nitrate of soda has come to hand and two cargoes are on the way. It was sold for shipment to this port. Chlorate of potash is stronger at New York, as is brimstone.

SULPHURIC ACID.—The demand is fair.

We quote in a jobbing way at 1½c per lb for 66%.

ACETIC ACID.—The market is steady at 6 to 12c per pound from store for carboys, according to make.

NITRIC ACID.—Our market is reported strong from store at 6¼@7c per pound in carboys.

BLUE VITRIOL.—Our market is firmer.

We quote in a jobbing way at 4½c per pound.

SPELTER.—The market is steady.

We quote our market in a jobbing way at 5 cents a pound.

BISMUTH.—The market is firm.

Our market is quoted in a jobbing way at $1.50 a pound.

BONEASH.—The demand is stronger.

Our market is quoted in a jobbing way as follows: Extra, 4c a pound; No. 1, 3½c; No. 2, 2½c.

PHOSPHORUS.—The market is firm.

We quote in a jobbing way at 70 to 75 cents per pound.

SODA ASH, 58% (LeBlanc process).—The market is firm at $1.55 per 100 lbs. in a jobbing way.

CAUSTIC SODA, 60%.—The market is quiet at 3c per pound in a jobbing way.

HYPOSULPHATE OF SODA.—There is a fair demand at 2½c a pound from stores.

NITRATE OF SODA.—Market is steady.

Our market is quoted from store at 4c for 95%.

Mining Share Market.

SAN FRANCISCO, July 29, 1897.

The market advanced with higher prices recorded along the entire line, but towards the close a weaker tone prevailed. The action of the market indicates that it is being worked for better prices provided under assessment scores outside holders sell. Sierra Nevada has been the leader so far, but if shorts have filled and some outsiders gone long, then it is not at all unlikely something else will be taken up to advance prices to a still higher range. Sierra Nevada sold up to $1.50 on reports of an unexpected gold find on the Layton tunnel. It is needless to say that experienced miners and well-informed operators do not take any stock in the unexpected find, for its existence has been known for years. Not only has that, but still larger and higher grade has also been known. Paid writers and cappers may assert that the work is in virgin ground and that this and that was not looked for, but it is safe to affirm that every body of ore not yet developed on the Comstock is known to the money inside pool, but whether it is known to others or officials is an open question. In several of the mines large acres of ground have been blocked out, while there is not one of the mines but secret drills or secret prospecting drifts have been run, and some day the ore found in several will be uncovered for the public, provided it is not taken out before and in such a way as not to show its true value or extent. While attention is attracted to Sierra Nevada, work in several other mines is overlooked by the public. This work can at almost any time be made to strike ore which can be magnified or enlarged as best suits the purposes of the manipulator. While there is no denying that a strong and successful bull campaign can be carried out, yet it looks very much as if the moneyed pool is opposed to it at present, but what may follow later on it is hard to say, outside of stating that the market has every indication of being worked for a small sized deal, notwithstanding the very low price of silver.

Letters filed the past week from Comstock mine superintendents do not vary to any great extent from previously received letters. The work in several is being pushed in the right direction and as fast as possible, all things considered. In Utah they are still pushing north from the main west tunnel. Nothing of importance is reported. In Sierra Nevada they are going west in crossdrift No. 3, 900-foot level. They ought to be in more favorable material soon. On the Layton Tunnel level they are at work in the north drift. Semi-official advices report having passed through 9 feet of ore, assaying from $15 to $45 a ton gold. This find, it is said, is to be prospected before long. The work is practically unchanged since our last issue. Nothing of much interest is looked for yet awhile. As was expected, the southwest drift in Mexican on the 1000-foot level has been stopped, for if continued the west lode would have been struck. When stopped the face was in a favorable formation. They are stripping the drift. In Ophir they are driving ahead west crossdrift No. 3 on the 1000-foot level and the south drift on Central tunnel level. They have found $1 ore up there and will soon find an assessment down here. The latter will give the best returns. Interest in Con. Virginia is still on the wane, although many think manipulators for high prices cannot do much until this mine shows an improvement on which to advance prices for its shares. Active work is reported on the 1000-foot, 1550-foot and 1650-foot levels. There has not been any change in the character of the work or of the material encountered. There were extracted the past week thirty-one tons of ore, assaying about $35 to the ton. The joint work in Best & Belcher and Gould & Curry is the same as given last week. Nothing new comes from Savage. No work is reported in Hale & Norcross. The delinquent assessment sale lists published by the contestants for Hale & Norcross have been postponed again. The shareholders will have to foot several good-sized bills, regardless of who wins. No work is reported in Chollar. The work in Potosi has run into old grounds at one point and into old fillings at another point. They have started a north drift from the top of the raise from No. 2 west crossdrift. They may be

We have correspondents in Chicago, New York and London, and are prepared to place good gold and copper mines. Mines in California, Nevada, Arizona, and New and Old Mexico a specialty. Write us for circulars, etc. DR. STEPHEN BOWERS, Pres.; H. C. SIGLER, Sec. Corner Temple and New High Streets.

Who Sees Your Advertisement?

Is an important question. When asked for an "ad" demand proof of extensive circulation among probable purchasers.

going north to freeze shareholders out of their holdings. There is nothing new from Bullion. In Alpha they are repairing the shaft. When work is resumed, it is reported, it will not be for the purpose of prospecting the ore found on the 500-foot level. Slow work is being done in the long west crossdrift that is being run jointly by Con. Imperial, Challenge and Confidence. Nothing new is reported from it. No ore was extracted the past week by Confidence. Nothing comes to hand from Yellow Jacket regarding work in the mine, but a large number of bull points have been put out. Informed miners are watching the work in Kentuck that is being done jointly by that company, Crown Point and Yellow Jacket. From Crown Point nothing of interest comes to hand through official sources. Work in Belcher will be resumed next Monday. It is to be hoped that the short rest will put new life into the management and result in showing up the ore struck several years ago.

From the Brunswick lode our advices are practically unchanged. The joint work on Con. Virginia, Best & Belcher and Gould & Curry is on the 300-foot level. The station on the 600-foot level, No. 2 shaft, has been completed. If the work is properly done on this level mining men say that better results will follow than has the work at any other point on the lode. In Chollar extensive repairing is being done. Work is being done on the 300-foot, 400-foot, 500-foot and 600-foot levels, without any material change reported. Nearly 200 tons were extracted and milled the past week. The battery sample assay was $17.28 gold and 17.24 ounces fine silver. The usual dead and prospecting work is being done in Occidental on the 550-foot and 650-foot levels.

The market opened steady this morning, but after Call Sierra Nevada showed strength under a freer demand. Large transactions were recorded which soon sent the shares to $1.75—selling higher than Con. Virginia. The demand for the shares is said to be due to a report that on the 900-foot level west crossdrift No. 3 had struck the east clay wall of the ledge. This information imparted more strength to Union. As it has been known for years that there is rich ore to the west, advices from the crossdrift will be closely watched. It may be that the work will not be pushed far enough west to get best results, yet enough may be done to cause shares of Sierra Nevada, Union, and also Mexican to sell higher. Reports are right for the first named to sell at from $3.50 to $4.00 a share. At the 2:30 o'clock session, Sierra Nevada sold at $1.75, but the others were slightly stronger. After Call the market was a shade weaker.

The following illustrates the changes of the week:

Of Colorado mining stocks F. H. Pettingell writes from Colorado Springs, Colorado: "There is one unfortunate fact prevailing among companies who have attained partial success, and that is the salary question. True, one cannot expect the affairs of a shipping proposition to be directed without compensation, but it does seem questionable for companies in debt that have been steadily shipping for a period of years to support luxurious offices and a large salary list. We have in mind a prominent company notoriously noisy regarding its most private affairs, and equally careless as to the truthfulness of the announcement of them, who are forever and eternally parading its never-realized brilliant prospects before the public, and apparently only accomplish the regular payment of liberal salaries to a line of officials that a most prosperous financial institution would consider the limit of extravagance, and as the company referred to has for several years gracefully supported a magnificent indebtedness, it seems hardly justice to the patient stockholders."

Regarding Utah stocks, Jas. A. Pollock of Salt Lake City, says: "A change in the management of the Ajax is very likely to occur within the next thirty days, one of the heavy holdings, that of Ryan and Nebeker, having just changed hands. Awaiting this prospective change, but little work is being done at the properties. Investors will probably look with more favor upon the stock should the management get into new hands, as all differences would then be settled. Already a better feeling has occurred in the stock. Anchor continues inactive. Somewhat increased inquiry for Bullion-Beck, evidently in anticipation of an early resumption of dividends, caused the stock to strengthen materially. The mines are looking and doing quite well. From the president of the company assurances of a dividend in August have been received, but it is sometimes best to await formal action by the board. Buckeye is prosecuting development work but the stock continues inactive and weak. Mercur has paid its July dividend and the stock sold up to and even above the $5 mark, closing strong and in fair demand. While the stock did not change materially, Mammoth held firm and was in some demand. Holders have evidently determined to play a waiting game. The mill is working to full capacity. Northern light was somewhat shaded. The mines are looking extremely well and the mill continues to do good work. Its new capacity should soon be completed. Ontario also lost some of its strength, but the labor troubles having been settled a reaction should come at once, although for some reason not given, the July dividend is being delayed. At local headquarters no opinion is expressed as to the delay. Omaha was not active and prices remained unchanged. This stock is looked upon with much favor as a long hold."

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING JULY 20, 1897.

586,530.—TELEPHONE.—W. W. Beck, Sebastopol, Cal.

586,681.—BICYCLE HOLDER.—G. W. Douglas, S. F.

586,707.—OIL WELL PUMP.—F. A. Garbutt, Los Angeles, Cal.

586,843.—EGG CRATE.—J. J. Goldbaum, Tucson, A. T.

586,737.—HARROW.—G. E. Guerne, Santa Rosa, Cal.

586,727.—DENTAL TOOL.—J. W. Hard, Tacoma, Wash.

586,793.—TELEPHONE.—S. C. Houghton, S. F.

586,614.—GEARING.—W. A. McCollough, Pasadena, Cal.

586,826.—EXPLOSIVE ENGINE.—F. A. Redmon, S. F.

586,937.—MUSIC LEAF HOLDER.—O. Sell, Modesto, Cal.

586,938.—HYDRAULIC MINING GIANT.—J. P. Simmons, S. F.

586,831.—SCALE INDICATOR.—E. Stebinger, Portland, Or.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

EXPLOSIVE ENGINES.—Frederick A. Redmon, San Francisco, Cal., assignor to B. L. Ryder, same place. No. 586,826. Dated July 20, 1897. This invention relates to explosive engines of that class in which explosive gas or vapor is employed to impel the piston and produce its ultimate reciprocations from end to end. It consists in the combination of duplicate cylinders, the pistons of which are connected with a crank on a common shaft, a driven shaft operated from the crank shaft having its ends projecting directly into the explosion chambers, electrodes in these chambers and on the extremities of the driven shaft respectively so that the alternate making and breaking of contact will produce the spark for igniting the charge at the proper intervals. In connection with this is a means for opening the exhaust valves for the escape of the products of the explosion, the valve being operated from the driven shaft. The inlet or suction valves which open into the explosion chambers have spring-controlled stems and a sliding sleeve adapted by its position to limit at various points the movement of the inlet valve stem and the governor operated by the driven shaft with connections from the governor to operate the regulating sleeve.

Rainfall and Temperature.

The following data for the week ending 5 A. M., July 28, 1897, are from official sources, and are furnished by the U. S. Weather Bureau for the MINING AND SCIENTIFIC PRESS:

DEWEY, STRONG & CO.,

PATENT SOLICITORS,

330 MARKET ST., - SAN FRANCISCO, CAL.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us to give advice which will give inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address **DEWEY, STRONG & CO., Patent Agents, 330 Market St., San Francisco, Cal.**

FOR SALE.

The Following Machinery, Nearly New. Now Located in State Agricultural Exposition Building at Sacramento:

One 16x42 R. H. Poppet-Valve O'Neil Automatic Cut-Off, 100-Horse Power Horizontal Engine, built by the Union Iron Works, with Band Pulley, 22 in.x124 in. Pipe Connections and Valves complete, as it now stands.

One 22 in. Double Leather Driving Belt.

One 18 in. Union Exhaust Steam Feed Water Heater.

One Buffalo Duplex Boiler Feed Pump 6x4x6.

Two Tubular Steam Boilers, 54 in. diameter, 16 ft. long, in good order, with Furnaces, Grate Bars and Settings complete; one Injector for each Boiler, and all the necessary Checks, Valves and Gauges.

One Stack, 48 in. diameter by 80 ft. long.

For price and particulars, address

EDWIN F. SMITH, Secretary, Sacramento.

FOR SALE CHEAP.

First-Class Air Compressor (Steam Driven) and Drill, New.

Also, 3-Ton Capacity Pulverizer.

A. L. FISH, 59-61 FIRST STREET, S. F.

FOR SALE CHEAP.

Gold Wet Washing Machine,

MAIT'S MAKE.

Capacity, 8 Tons Per Day.

Good order. Can be carried anywhere by prospector.

Address T. L., this office.

Pacific Refining & Roofing Co.,

113 NEW MONTGOMERY ST., S. F.

Works, Potrero.

W. & P. ONE-PLY ROOFING.

For temporary use. Good for 2 or 3 years. Felt, Coating, Tin Caps, Nails—complete.

Per Square of 100 Feet, $1.50.

W. &. P. THREE-PLY READY ROOFING.

A permanent roof. Easily applied. With Coating, Tin Caps, Nails—complete.

Per Square of 100 Feet, $3.00.

W. & P. PARAGON ROOF COATING.

A good and cheap roof paint for wood or metal. Also for water-proofing walls, submerged or buried woodwork.

Barrels, 30c; Five-Gallon Cans, 35c.

W. & P. BLACK DIAMOND PAINT.

Unequaled for boiler fronts, stacks, pipe coating, or wherever a first-rate black paint is wanted.

Barrels, 40c; Five-Gallon Cans, 45c.

Specify W. & P. Can be Ordered of Dealers.

Gold, Silver and Copper Ores and Sulphurets

BOUGHT AT HIGHEST MARKET PRICES.

SPECIALTY, COPPER ORES.

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by the hydraulic process from the May Flower Gravel Mining Co., in the May Flower Mine, near Forest Hill, Placer Co., to deposit tailings in Black Hawk Creek; from Dr. J. P. Welch, in the Pactolian Mine, near Genesee, Plumas Co., to deposit tailings in Grizzly Creek; from the Gold Bug Mining Co., in its mine near Georgetown, El Dorado Co., to deposit trilings in Canon Creek; and from E. D. Bowman et als., in the Eclipse and Boston Claims, near Onion Valley, Plumas Co., to deposit tailings in Poorman's Creek, gives notice that a meeting will be held at room 59, Flood Building, San Francisco, Cal., on August 2, 1897, at 1:30 P. M.

Skeleton Mining Report.

NEEDED BY EVERY MINING MAN.

FIFTY CENTS POSTPAID.

Mining and Scientific Press, 330 Market St., S. F.

Assessment Notices.

ROSE CREEK MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Star, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 28th day of June, 1897, an assessment (No. 1) of 15 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room 163, Crocker building, junction Post, Montgomery and Market streets, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 21st day of August, 1897, will be delinquent, and advertised for sale at public auction: and unless payment is made before, will be sold on TUESDAY, the 14th day of September, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. M. WILMANS, Secretary.

Office—Room 163, Crocker building, San Francisco, California.

BEST & BELCHER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia District, Storey County, Nevada.

Notice is hereby given that at a meeting of the Board of Directors, held on the 1st day of July, 1897, an assessment (No. 62) of 25 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, room 33, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 4th day of August, 1897, will be delinquent, and advertised for sale at public auction; and, unless payment is made before, will be sold on THURSDAY, the 26th day of August, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

M. JAFFE, Secretary.

Office—Room 33, Nevada block, 309 Montgomery street, San Francisco, California.

OSCEOLA CONSOLIDATED MINING COMPANY. Location of principal place of business, San Francisco, California; location of works, Amador County, California.

Notice is hereby given that at a meeting of the Board of Directors held on the 30th day of June 1897, an assessment (No. 6) of 1 cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, 307 Montgomery street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 2nd day of August, 1897, will be delinquent, and advertised for sale at public auction, and, unless payment is made before, will be sold on SATURDAY, the 21st day of August, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

HOLLAND SMITH, Secretary.

Office—307 Montgomery street, San Francisco, Cal.

THORPE MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Fourth Crossing, Calaveras County, California.

Notice is hereby given that at a meeting of the Board of Directors held on the 9th day of June, 1897, an assessment (No. 7) of 2½ cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, room 44, Phelan building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 17th day of July, 1897, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on MONDAY, the 9th day of August, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

A. F. FREY, Secretary.

Office—Room 44, Phelan building, San Francisco, California.

POSTPONEMENT.

By order of the Board of Directors, the day of delinquency of the above assessment has been postponed to July 31st, 1897, and the day of sale to SATURDAY, August 21st, 1897.

A. F. FREY, Secretary.

Office—Room 44, Phelan building, San Francisco, California.

INYO MARBLE COMPANY.—Location of principal place of business, San Francisco, California; location of works, Inyo, Inyo County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 27th day of July, 1897, an assessment (No. 30) of 10 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, room 323 Phelan building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 28th day of August, 1897, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on MONDAY, the 20th day of September, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

M. A. CAHN, Secretary.

Office—Room 323 Phelan building, San Francisco, California.

MARGUERITE GOLD MINING AND MILLING Company.—Location of principal place of business, San Francisco, California; location of works, Auburn, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 28th day of July, 1896, an assessment (No. 7), of 10 cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the Secretary, at the office of the company, 237 12th street, San Francisco, California.

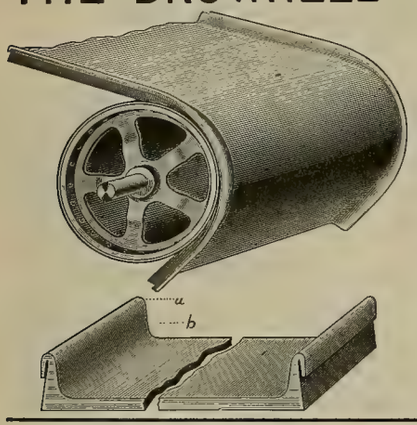
Any stock upon which this assessment shall remain unpaid on the 10th day of September, 1897, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 11th day of October, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

F. METTMANN, Secretary.

Office—237 12th street, San Francisco, California. The Secretary will also receive payments from 12 to 5 P. M. at his business office, 226 Sansome street.

THE BROWNELL "PATENT LIP" FLANGE FRUE VANNER BELTS.



It has taken years of ceaseless testing and experimenting to produce the superior belt which we now offer, with elastic flanges and pliable body reinforced with specially woven duck. Every belt is manufactured by experienced workmen, and carefully tested on machines especially built for that purpose; consequently we are to-day manufacturing the best belts that mechanical ingenuity, combined with honesty of construction, can possibly produce.

SUPT. OFFICE WILDMAN GOLD MINING COMPANY, SUTTER CREEK, AMADOR CO., CAL., Feb 22, 1897.

MR. JAS. S. BROWNELL, 132 Market St., San Francisco, Cal.—DEAR SIR: Replying to your favor of the 18th inst., will say that in the two mills operated by this company we have nineteen of your Patent Lip flange concentrator belts in use; some of them have been in constant use for the past two years and have given entire satisfaction. I know of no better flange for a side shake machine.

Yours truly, JOHN ROSS JR., Superintendent.

MEXICAN MILL, EMPIRE, NEV., March 28, 1897.

MR. J. S. BROWNELL, San Francisco, Cal.—DEAR SIR: For some years we have used three different styles of belts on our Frue vanner at the Mexican mill, and for smooth working and endurance the Brownell Patent Lip flange belt has proved its superiority over all others, and I unhesitatingly recommend it to all who are using Frue machines.

Yours truly, EUGENE MAY, Foreman.

For any information regarding Frue Vanner or Belts, call on or address

JAS. S. BROWNELL, Western Agent FRUE VANNING MACHINE CO.

(Successor to Adams & Carter.) 132 MARKET STREET, ROOM 15, SAN FRANCISCO.

RISDON IRON WORKS,

Office and Works: Cor. Beale and Howard Sts., San Francisco.

READ WHAT MINERS THINK OF THE BRYAN PATENT ROLLER QUARTZ MILL AND JOHNSTON CONCENTRATOR.

OFFICE OF THE CANDELARIA CONSOLIDATED MEXICAN MINING CO., SAN DIMAS, DURANGO, MEXICO, October 25, 1888.

RISDON IRON WORKS, San Francisco—Gentlemen: Our company has been operating three of the 4-foot Bryan Roller Quartz Mills, one of which has been running steadily for three years, one for two and one for one year. Our quartz is very hard; we crush through a No. 60 mesh screen. Our mills run 55 revolutions per minute, and each crush through 60-mesh screens 12 tons in 24 hours; through 50-mesh, 15 tons; and through 40 mesh, 18 tons. This proportion has been continuous.

One set of dies will crush from 1500 to 1600 tons.
One set of tires will crush 1500 tons.
One ring plate will crush from 2200 to 2300 tons.

The mills require very little attention. At our mill an ordinary "peon," earning one dollar per day, has complete charge.

In regard to sliming, in comparison with stamps, by reason of the discharge surface and the continuous agitation by the scrapers, a MUCH less amount of slime is created. A three years' experience teaches me that, in every respect, the mills are a complete success, and of material benefit to the mining world. They can be set up and running in forty-eight hours and can be dismounted in the same time and removed to wherever desired. Ours were packed on our mule trail over as difficult a road as any in Mexico. As a gold amalgamator it is unequaled by any mill now in existence. Yours truly,

D. M. BURNS, Superintendent.

BULLION-BECK AND CHAMPION MINING COMPANY, EUREKA, UTAH, August 24, 1895.

THE RISDON IRON AND LOCOMOTIVE WORKS, San Francisco—Gentlemen: Referring to contract made by you with the Bullion-Beck and Champion Mining Company, by which you were to furnish one 5-foot Bryan Roller Quartz Mill on four months' trial, in competition with the Huntington Mill, would say that we have made the test, and the Bryan Mill has proven so greatly superior on all points claimed, viz., capacity and economy, that we have ordered a second Bryan Mill from you and have concluded to discontinue the use of the Huntington Mill.

Yours truly, JOHN BECK, Pres.

SIMON BAMBERGER, Director. [Copy.] W. J. BEATIE, Sec't'y.

BULLION-BECK AND CHAMPION MINING COMPANY, EUREKA, UTAH, Aug. 24, 1895.

THE RISDON IRON AND LOCOMOTIVE WORKS, San Francisco—Gentlemen: In February last, in connection with the five-foot Bryan Roller Mill which we took from you to test in competition with the Huntington Mill, we also took a six-foot Johnston Concentrator to be tested with ten Frues, one end shake with four belts and one side shake Woodbury. We have been working these machines since the mill was completed, at such times when we had sufficient water.

The terms on which the test was made was that the machine doing the most satisfactory work should be accepted and the others taken out. This did not apply to the Frue, as they were purchased with the plant. In compliance with this agreement, we now inform you that the Johnston Concentrator has proved so superior over the other machines that we now order from you four more of the Johnston Concentrators. Yours truly, JOHN BECK. Pres.

SIMON BAMBERGER, Director. W. J. BEATIE, Sec't'y.

GREAT SALT LAKE AND HOT SPRINGS RAILWAY, S. BAMBERGER, President and Manager, SALT LAKE CITY, UTAH, October 10, 1895.

B. R. TAWNDRAW, ESQ., care Guyer Hot Springs, Ketchum, Idaho—Dear Sir: In reply to yours of the twenty-eighth of September, we have been using at the Bullion-Beck Concentrating Works, Frue Vanner, Woodbury and Johnston machines, side by side for the last four months; and after a thorough trial of all of them, we concluded that the Johnston Vanner was doing the most accurate work and was the best; hence, we bought four more Johnston machines and shall continue to use them in preference to any other.

You will find it the easiest regulated machine and very much easier set up than either of the other machines. We bought our machines from the Risdon Iron Works, of San Francisco, where Mr. Johnston, the patentee, personally superintends the manufacturing of them.

Hoping you will make a success, I remain, Yours truly,

[Copy.] [Signed] SIMON BAMBERGER.

THE GOLD VALLEY MINING COMPANY OF SAN FRANCISCO, C. C. McIVER, President; D. CUSHMAN, Secretary, MISSION SAN JOSE, CAL., Oct. 17th, 1895.

RISDON IRON AND LOCOMOTIVE WORKS, San Francisco—Gentlemen: We take great pleasure in having to inform you that, after a careful investigation extending over a six weeks' steady run alongside of six other concentrators, the Johnston which you put in for us was the only machine from which you could not find a loss in the tailings. It has done all you claim for it and has proved more than satisfactory. We intend replacing all our other concentrators with Johnston's, as we are convinced they will pay for themselves many times over in a year. CHAS. C. McIVER, President.

Novel Method of Cable Carrying.

Some weeks ago appeared in the Telluride, Colorado, *Journal* an account of a novel method of moving a steel wire cable, which was deemed worthy of notice. Through the courtesy of Mr. H. L. Servis, the editor of the *Journal*, a photograph of the sight as seen in Telluride was secured from Moore Bros., the local photographers, from which the accompanying illustration was engraved. It gives a graphic idea of the difficulties often encountered and as often ingeniously solved by miners all over this west half of America. The accompanying account is clipped from the *Journal* of issue July 3rd, '97:

"A Big Undertaking—Twelve Thousand Feet of Tramway Cable Packed on Mules. Telluride witnessed a novel and interesting sight yesterday afternoon, when a pack train of sixty-five mules selected from D. Dimond's herd of pack animals, loaded with the new cable for the tramway between the Nellie mine and the Telluride Power Transmission Co.'s mill, up Bear creek, were grouped on Colorado avenue for the purpose of being photographed. It is believed this method of moving tramway cables from the railroad to their point of destination originated here, and it certainly obviates the almost impossible difficulties that attend the moving of great masses of material over our mountain trails. The cable in mention was manufactured for the company building the tramway and reached here Thursday, wound on a single spool containing 12,000 feet of ⅞ steel wire rope weighing nearly 15,000 pounds. The first step was to arrange the cable for packing, and this was done

TWELVE THOUSAND FEET WIRE ROPE PACKED ON SIXTY-FIVE MULES IN COLORADO.

TRANSPORTING AN 800-POUND CAM SHAFT THROUGH A TIMBERED COUNTRY TO AN OREGON GOLD MINE.

by unwinding from the spool and recoiling it into 130 small coils of some 3 or 4 feet in diameter. These coils were tied with wire and laid about 9 feet apart. When this was done the mules were brought down from the barns at Pandora and strung along the coiled cable that stretched out over two blocks of ground. Beginning at the lead mule the packers then raised each set of two of the small coils, placed them over the saddle, to which they were firmly lashed so as not to shift from an even balance while on the trail. The work of loading the cable was completed in less than three hours, and after posing for the photographer the train of sixty-five mules with its load started for its destination on the tramway line."

The inventive genius of the American miner is further shown by the subjoined; the cut alongside depicting the conveyance through dense spruce woods of a cam shaft to the Bohemia district, Lane county, Oregon.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Twelve Thousand Feet Wire Rope Packed on Sixty-five Mules in Colorado; Transporting an 800-Pound Cam Shaft Through a Timbered Country to an Oregon Gold Mine, 117. The Caracas Warehouse of the National Association of Manufacturers; Interior View of Warehouse of the National Association of Manufacturers; Plan of Warehouse of the National Association of Manufacturers, 120. New Form of Trolley and Electric Vehicle, 124. A Non-Return Air Vessel for Hydraulic Power Conduits, 125.

EDITORIAL.—Novel Method of Cable Carrying, 117. A Free Tariff Zone in the Yukon; The Canadian Royalty on Gold Mining in the Yukon; How to Prospect in the Yukon Gold Fields, 118.

ELECTRICAL PROGRESS.—A New Electrical Invention Applied to Road Wagons; Contracts Given to Americans; The Midland Railway Company; A New Alarm System, 124.

SCIENTIFIC PROGRESS.—To Explore New Mexican Cliffs; Influence of Dissolved Metallic Salts, 124. The Compressibility of Quicksilver; Liquefied Carbonic Acid; Migration of Forms, 125.

MECHANICAL PROGRESS.—Water Power Under Pressure; What a Submarine Boat Can Do; To Preserve Boilers; A Self-Lubricating Bearing; Distinguishing Iron from Steel, 125.

MINING SUMMARY.—From the Various Counties, of California Nevada and Other Pacific Coast States and Territories, 126–127.

THE MARKETS.—Eastern and Local Markets; Mining Share Market; Sales in San Francisco Stock Board; Notices of Assessments, etc., 128–130.

MISCELLANEOUS.—Concentrates, 119. A Sample Warehouse for American Goods in Caracas, Venezuela, 120. The Alaska Gold Fields, 121. A Curious State of Things; Closing Up the Pores of Aluminum and Brass Casting; The American Bimetallic Commission; A Yukon Miner's Outfit; Tasmania's Native Population; Solution of an Electrical Problem, 122. Reduction of Zinc Gold Slimes; United States Mining Laws Applicable to Alaska; Appreciated Compliments; Scientific Discussion of the Klondyke Placers; Tenth Annual Report of the Interstate Commerce Commission, 123. Coast Industrial Notes; Personal; Commercial Paragraphs; Recently Declared Mining Dividends; Recent California Mining Incorporations, 129. List of U. S. Patents for Pacific Coast Inventors; Notices of Recent Patents, 134.

The Canadian Royalty on Gold Mining in the Yukon.

The Canadian mining laws are in many respects very much superior to ours. Requiring miners to take out a license and to pay a registration fee on locating a claim, and another for each year that it is held, they in return practically guarantee a miner's title and mining litigation is as a consequence impossible there. In the settlement of disputes there is a final authority close at hand, and disputants are assured of justice or the other thing without vexatious delay. The miners have also the satisfaction and benefit resulting from the entire expenditure of the money taken from them in fees in the construction of roads and trails and other public utilities for their direct benefit. The last promulgated laws are, however, a most surprising and mischievous innovation which has no precedent in the action of any other Government toward gold mining. In addition to the fees and charges already imposed, the Government proposes to exact a royalty of 10 per cent of the gross product of claims producing less than $500 monthly and 20 per cent where the product is over $500 a month. It is also proposed that when new districts are discovered every alternate claim shall be reserved by the Government. This last proposition is practically the equivalent of saying to miners, "You must not find new mines, for if you do we will take one-half away from you." The attempt to apply it will inevitably result in stopping exploration by taking away its incentive. In the imposition of the royalty, it is charitable to believe that the Canadian Government is suffering from a temporary loss of intelligence. It has undoubtedly been made dizzy contemplating the large fortunes made so rapidly in the Klondyke placers. It has undoubtedly become possessed with the idea that all the placers of the Yukon in Canadian territory, particularly those yet to be discovered, are equally as rich, and that it ought to have a share of the gold that is so easily to be obtained. The most moderate reflection on the history of gold mining everywhere in the world should have precluded the Government from becoming possessed of this wild, crazy idea. Gold mining everywhere gives in the end, or through a number of years, just about the same average of reward. While some few individuals make riches, more make simply good wages, and the great mass barely make a living. There is no reason to suppose the Yukon, with its terrible climatic handicap, will do more than California, more than Australia, more than Russia, or more than South Africa. The average of profit in these has ultimately come to be the same, all things being considered, and that profit is less than the royalty proposed to be exacted by the Canadian Government. Not only is it less, considering the average, but it is only of the very richest mines that any profit margin would be left after deducting a royalty of 20 per cent of the gross. This will be clearly evident on examining the published balance sheets and reports of the Transvaal mines or of the gold mines owned by English capital the world over. It is only exceptionally that the dividend balance exceeds 20 per cent of the gross output. The inevitable effect of the persistence of the Canadian Government in its royalty policy will be the abandonment of mining and exploration in the Canadian portion of the Yukon basin.

How to Prospect in the Yukon Gold Fields.

The great majority of the men rushing to the Klondyke are "tenderfeet." They have never seen a gold mine, and their comprehension of what is a gold mine is derived from a perusal of the flotsam and jetsam of the daily press. Few of them go prepared to buy claims already opened, and must locate and prospect claims for themselves. Brain-laden with absurd ideas as to the origin of the gold, and ignorant of the natural laws of its distribution, confronted in the country with the severest physical conditions under which gold mining is followed anywhere, it is impossible but that there should be many disappointments before a sufficient number of successes shall have come to accumulate the needed experience. Elsewhere in this number of the PRESS is an article on "The Alaska Gold Fields," which will repay careful reading by those intending to mine in that country. Its discussion of the geology and topography of that mining locality is the basis of the suggestions here made.

The first thing that a "tenderfoot" miner going to the Yukon from this city should do is to visit the State Mining Bureau museum and acquire as far as possible an acquaintance with the appearance of the commoner varieties of the rocks. He should so familiarize himself as to be able to recognize granite, sandstone, limestone, slate, serpentine, schist, diorite, diabase, talc, trap, dolerite, dolomite and porphyry. It is not anticipated that he could become infallible in recognizing these rocks, but he should be able to successfully recognize them in the majority of instances. The ability to recognize gold, mica, pyrite, chalcopyrite and galena is also advantageous.

On the ground, and presuming all of the possible ground of the Klondyke placers already appropriated, the attention of the miner should be first given to unproven possible ground in the valleys of streams adjacent to those in which gold has already been found and to the valleys of streams which head in the same hills or mountains as do these known gold-bearing streams. It is possible for the lode system which has enriched one stream to have been cut by the drainage basin of another, so that it has enriched that as well. In the Yukon, as elsewhere, the mountain uplifts have resulted in forming fissured and fractured zones in the rocks which have filled with the gold ores. These, if on one side of a mountain, are apt to be duplicated on the other; and, though neither can be seen, both can be inferred from the discovery of gold on one side of the drainage. It is justified to look for gold on the other side as well. As an additional guide, the gravel rock fragments in the gold-bearing stream should be compared with that being prospected. If the two contain identical rocks, and particularly if they both contain quartz, diorite, diabase or porphyry pebbles, it is worth the chance to extend the prospecting, even if the first efforts disclose no gold. When gold is found in several claims in the same valley, the direction of the line of the deposit should be noted and the first prospecting should be done in that line as being the most probable one for the placer. The gold produced by the several claims going up stream should be compared both in total quantity and size of grains. With the data of this comparison it is possible to reason out the locus of the richest ground and also to know when the lode source of the gold is being approached. Coarse gold, gold with attached quartz fragments and rough gold all indicate that the source is comparatively close at hand—that a point is being reached beyond which there will be no placer. The Russians, in their mining of the Siberian placers, failed generally to recognize the lode sources of the gold, and in many instances carried their prospecting for placers miles up stream beyond the lodes from which the gold came. There is no reason for American miners making the same mistake. Another indication of nearness to lodes is the presence of rough fragments of pyrite, chalcopyrite or galena. Even if these last do not lead to gold-bearing lodes, they may lead to valuable lodes of copper or lead.

Generally, anything heavy that is found in the mining should be determined. Silver, quicksilver, tin and nickel ores and platinum are all worth considering even in Alaska. The possibility of their occurrence should not be lost sight of, the more particularly as their discovery is only to be made by following up the stream indications. The covering of snow over the surface for seven months of the year, the covering of moss for the other five months, precludes the possibility of prospecting by the ordinary surface methods.

Where it is necessary to prospect without the guide of discoveries already made adjacent, almost total dependence must be placed on the character of the pebbles in the gravels uncovered in prospecting. If much quartz be found, even though no gold at first, it is advisable to cover the possible ground for a placer pretty thoroughly before abandoning it finally.

As a general proposition it will prove very advantageous for a dozen or more miners to co-operate in making a systematic exploration of unknown ground. Work can be done cheaper, faster and surer than by the same men acting independently. Co-operation admits of increasing the tool outfit by a blacksmith shop and drill outfit. Powder can be used and the prospect holes sunk through the frozen ground much faster than by fire. Prospecting can be spread over a much larger area by co-operation than by the same men acting each for himself. Co-operating, once the gold lead is found, the whole company are in a position to intelligently secure a valuable claim for each member and to get the claims so connected that they can be economically exploited as one property. It must be remembered that the present cumbersome method of exploitation will soon be replaced by quicker and better ones, admitting of the profitable working of the ground now left unworked and distinctly advantageous to large claims compared with small ones.

A Free Tariff Zone in the Yukon.

Not content with taking 10 and 20 per cent royalties, not satisfied with reserving half of the gold mines that may be hereafter discovered to itself, the Canadian Government is taking heavy toll in the way of duties on the individual outfits of miners to the Yukon from the United States. Assuming that such mistaken policy will be abandoned before long, the question of duties may come under consideration on its merits. If it should, the suggestion is made that both countries, for an agreed term of years, make the Yukon basin a tariff-free zone. The conditions of life are hard enough there at the best, and Government policy should be directed to lightening the burdens of miners to the largest possible extent. Till the country builds up its industries the admission of Canadian goods to our portion of the Yukon basin, either overland or by the river, could be duty free, and the corresponding privilege could be extended to American goods in the Canadian portion of the Yukon basin. The conditions are such at the present time that Canadian goods to enter its own territory must cross our territory, and our goods for our section of the basin, except by the river route, must cross Canadian territory. These conditions create annoyances and vexatious charges that benefit neither Government, nor the citizens of either. The extraordinary conditions justify extraordinary action. It will be good business policy for the action to take the form suggested, the formation of the Yukon basin into a tariff-free zone for a term of years.

Concentrates.

GOLD from Riddle, Oregon, placer mines is 23.28 carats fine.

GEORGETOWN, Cal., is being rebuilt in a substantial manner.

ALL outfits imported into Klondyke are subject to Canadian duty.

LAST Saturday was shipped from New York to Europe $3,975,000 in gold.

A BRITISH COLUMBIA mining section has been opened in the London Exchange.

SO FAR about as much gold has been taken into the Klondyke as has been carried out.

TO JULY 1st there were 1770 mineral claims recorded in Fort Steele, B. C., mining district.

THE Methow Mining Co., near Ives, Wash., report a 24-inch ledge unusually rich in copper.

WHEN the Golden Gate mill is finished, Mercur, Utah, mills can daily handle 1000 tons of ore.

OLINGHOUSE CANYON, Nevada, reports "dirt $100 to the shovelful," thus discounting Klondyke.

THE first best evidence of an international bimetallic agreement will be a rise in the price of silver.

GOLD placers easily worked are reported forty miles east of White Hills, Arizona, on the Colorado river.

FROM January 1st to July 27, '97, there was exported from New York gold to the value of $25,518,713.

THE New Zealand courts have allowed an amendment of the patent of the Cassel Gold Extracting Company.

THE purchase of the Pilot Bay smelter by the Omaha and Grant Smelting Company gives Kootenay three smelters.

JAS. TAYLOR, superintendent Mammoth mine, Summit Flat, Idaho, is about to replace his 8-stamp mill with a larger one.

PRESIDENT MYERS of the Diamond R at Neibart, Montana, is planning to build a 100-ton concentrator and two-mile flume.

THE election of officers of the California State Miners' Association will be at the annual convention in this city on Oct. 18, '97.

DURING July, 5,824,950 ounces of silver were exported to Europe from New York. Present quotations are lowest on record—55⅛ cents.

"I am going to the Klondyke to make money to develop my California property," is what three miners told "Concentrates" last week.

ASSESSMENT WORK is now in order. In case of joint ownership of adjacent claims work done upon one tending to development of all suffices.

THE old theory that Arizona gold mines didn't "go down" is being abundantly disproved in Prescott and elsewhere through the Territory.

IN the next two or three years prospectors will drift south from the Klondyke and north from Cariboo, going over that entire northern country.

THE present depreciated price of silver calls strongly to mind the conditions of '76, when for a $20 gold piece in this city, one got $19.75 in silver.

BATTLE MOUNTAIN, Nev., reports the discovery of recent copper properties there by Salt Lake men that are considered worth extensive development.

INCLUDING '97 Boston figures that copper mine dividends paid in that city aggregate over $82,500,000, approximating the Comstock twenty years ago.

DRIFT MINING constitutes one of the most promising of returns in California, as where rightly started the proportion of profit to the investment is unusually great.

NOW is the time of year when papers that do their little best or worst to discredit mining all the remainder of the year get up a "special mining edition."

THE Mountain Copper Company, Shasta Co., Cal., have relinquished the bond on the Windy Camp mines to Alex Hill. They spent considerable money in development work.

THE Gold Creek Mining Company of Nevada have, in the current issue of the Gold Creek *News*, twenty-nine notices of applications for patents. This is declared to be only a part of the company's holdings.

FROM Milford, Utah, comes a report of something new in that locality—the bed of an ancient lake to be drilled in various places to a depth of 40 feet, on the assumption that beneath the hardpan gold will be found.

THE case of Silver Peak Mining Company of Esmeralda county, Nevada, vs. L. J. Hanchett is on trial in the U. S. Circuit Court at Carson. The case is one to break a contract of the sale of the property and to recover $201,000.

THE Klondyke craze, unfortunately, adds to the already too large list of those who assume to add "Mining Engineer" after their names without possession of the necessary qualifications, striving to better themselves and best others.

EMULATING the Sutro tunnel, the proposed Pike's Peak tunnel and other gigantic bores, Florence, Idaho, proposes a tunnel to tap that camp at a depth of 3500 feet. The capital stock is $25,000,000. A special act of Congress will be sought.

SUPERINTENDENT CHAMBERS of the Ontario and Daly, Utah, mines, says regarding the low price of silver, that a drop in wages there is inevitable: "it is necessary that the miner share the distress to which the companies are subjected," he says.

A REVIVAL in nickel mining is reported in New Caledonia, Australia. Contracts for the supply of 20,000 tons of ore have been made. John Higginson and Earl Dunmore have engineers opening up copper, gold and nickel properties at the north end of the island.

A BOSTON dispatch says "fourteen workmen out of employment, led by a socialistic politician, have started to walk to the rich mines of Klondyke," which painfully illustrates the resultant inconvenience of being destitute of brains in Boston or elsewhere.

DYNAMITE is 75% nitro-glycerine, 25% infusorial earth; dualine 80 parts nitro-glycerine, 20 nitro-cellulose (gun cotton); rend-rock 40 nitro-glycerine, 40 nitrate of potash, 13 cellulose, 7 paraffine; giant powder 36 nitro-glycerine, 48 nitrate of potash, 8 sulphur, 8 resin or charcoal.

THE Le Roi Company has let the contract for the erection of its smelter at Northport. According to British Columbia papers, there is considerable indignation over the action of the Spokane company, and the belief is expressed there that the Dominion Government will put an export duty on ore. The Le Roi Company is charged with having failed to show that smelting at Northport will be cheaper than at any British Columbia site offered them. The papers accused the company of double-dealing and bad faith.

THERE is a present deplorable waste of effort in the energetic impulse to boom the British Northwest Territory. One-fifth of the free advertising and money spent in the last three weeks would be of incalculable benefit to the mining industry of the State.

BESIDES the present Alaska "rush," there is also a stampede in Peru to recently discovered gold fields in the Andes foothills and to the mainland of New Guinea. Enthusiastic British scientists assert there is also gold in the stars, but travel in that direction is necessarily limited.

THE San Francisco Mint reopened for business last Monday after six weeks' close for the annual recounting, etc. The gold accumulations at the Mint during the six weeks was $4,000,000. Of this about $800,000 was from Klondyke; the remaining $3,200,000 represented the usual receipts.

IN the case of the water dispute in Shasta Co., Cal., between the Mountain Copper Co. and Messrs. Paul and Garlick, the U. S. District Court decrees that Paul and Garlick shall have the right to divert fifty miners' inches of water from Spring creek and the Copper Company 340 inches.

W. J. ARKELL, proprietor of a New York City illustrated paper, is not wholly devoid of nerve. On the strength of an alleged "expedition" to Alaska in '90, he lays claim to 4400 square miles of "gold fields" on the Yukon and now announces that he will "enforce" his claim. He will have a happy time of it.

THE Teagarden mill at Magnolia, Colorado, owned by the Buckeye Company, is to be changed to a concentrating mill. This was a chemical process of which great things were claimed for a number of years, but was productive of no tangible results. The inventor still claims that it was a success if it had been fairly tried.

ACCORDING to the Marysville, Cal., *Appeal*, J. Hibbert of Brown's Valley, Yuba county, Cal., this week refused an offer to go to Klondyke for Eastern people of $15,000 for the first, $25,000 for the second year's expenses, a year's supplies to await him at Dawson City, and ten per cent interest in any discoveries he might make.

IN California, Colorado, New York, Ohio and Pennsylvania have already been organized Klondyke mining companies, with stock for sale, the intent being to thus secure sufficient funds to send a corporation representative. Beyond the speculative feature of the proposition, the main point for such a company is to be sure of its man.

"A TECHNICAL JOURNAL with a thousand subscribers has a greater number of readers of the sort the advertiser wishes to appeal to than the daily paper circulating a hundred thousand copies." And a technical journal with 6000 intelligent subscribers offers better inducements to the advertiser in that line than ordinary others circulating half a million daily.

REGULATIONS respecting the issue of leases to dredge for minerals in the submerged beds of rivers in Manitoba and the Northwest Territory have been made by the Ottawa council. A twenty-year lease may be given by the Minister of the Interior for the exclusive right to subaqueous mining and dredging for minerals, with the exception of coal, for an unbroken extent of five miles of the river.

THE 20-stamp mill at the English Mountain mine, Graniteville, Nevada county, Cal., was burned to the ground last week. It is thought the fire caught from a spark from the blacksmith shop. It was erected two years ago by the English company which then operated the mine, and it is thought by the *Union* to have cost $40,000. The property was uninsured and is a total loss to J. Holdsworth, the owner. The mine is under bond to San Franciscans.

ALMOST daily passenger steamers are leaving San Francisco for the Klondyke, while the number of smaller craft headed northward is increasing. The same statement applies to northern ports. Four steamers left Seattle, Wash., this week with 1200 passengers and about 700 horses. The crush will make terrible hardship for thousands this fall and winter, but it appears of little use to point out the inevitable result to those afflicted with the present craze.

"THE Alaska Cynite Co." is sending letters to California men claiming to control an "equanomical system of placer mining," having three of the best mines in Klondyke, with expectations to "mine one million in gold by Sept. 1, '98, at which time there will be a hansome dividend." Suggestion is made that a club be informed in each "vacinity" and stock purchased. The alluring document should be circulated in darkest Indiana or Ohio and allied with Hartzfeldt, Pearce and other fakirs.

MANY California miners remember Dr. Noble Martin, "Old Grizzly," whose recent demise was a matter of personal regret to many. O. K. Cloudman of You Bet, Nevada county, Cal., has taken up the idea of a suitable monument to his memory. Hon. J. H. Neff, president of the California State Miners' Association, has consented to act as treasurer, and it is unnecessary to say that the efforts in life of Dr. Martin deserve the fullest recognition at the hands of those whose principles he so ably defended.

THE salient points of the recent Colorado Supreme Court tunnel decision are that the owner of a tunnel site is entitled to blind lodes discovered in running the tunnel, providing, they were not discovered on the surface prior to the tunnel location; that he has prosecuted work in the tunnel with reasonable diligence; he has no right to run the tunnel through a previously located lode without permission; the law having been complied with, he is entitled to 1500 feet on any lode discovered in the tunnel, the same as if discovered on the surface.

IF copper ore, in carbonate form, happens to be in the gold or silver ores treated, it will require sixty pounds of cyanide solution to each per cent of copper it contains. Sulphuret of zinc in ore always causes trouble, and antimony, if alloyed with gold prevents the extraction of the latter metal. If one-tenth of one per cent of antimony is taken up by the solution it at once becomes worthless. Pyritic ores, if free, will work raw, otherwise they must be roasted. The solution has great affinity for chloride of silver.

CONGRESSMAN BELL of Colorado has introduced a bill in Congress amending the tunnel site act, to provide that if the tunnel owner wants to claim and hold a tract 1500 feet wide by 3000 feet on the tunnel he must keep two shifts of miners at work all the time. Failing to do this, he can only hold the width of the tunnel for prospecting purposes, depending upon the discovery of lodes not discovered on the surface for his labor. The recent decision of the United States Supreme Court says, in effect, that so long as a tunnel owner works with reasonable diligence he can reserve the larger tract for prospecting.

THE mining plan adopted last winter at the Klondyke was to burn wood to thaw out the ground, but this method is slow and expensive, as wood costs from $8 to $15 a cord, and the heat caused by the burning wood made it difficult to keep the fires going, as water from the melting snow kept pouring down. A new device is proposed, a sort of improvised blast furnace, which can be operated with wood, charcoal or petroleum, by which it is hoped that three men with a machine can thaw out 10 to 30 feet of frozen ground per day. The miners' ingenuity can be depended on to solve the problem. One sanguine inventor has devised a small high pressure boiler with steam hose attachments and an iron nozzle, to be driven into the frozen ground and the steam turned on, when he expects rapid and effective work to be done.

THE latest obtainable authentic reports regarding the production of gold and platinum in Russia say: In the gold beds under the management of the Department of Mines 2372 poods (86,357 pounds) of gold were found in 1895. Over half this amount came from the territory of Irkoutsk, about one-fourth from the Ural, and the remainder from Tomsk. From the gold beds belonging to the Czar 137 poods (5017 pounds) were taken. Of this amount the larger part came from the district of Jourguine. About 10 pounds were found in Finland. It appears from these figures that the total production was 108 poods (3800 pounds) less than the production for the preceding year. Platinum is found in the Ural, in the districts of Perm, and in the mountainous regions of Verkhoutorski. Nearly 270 poods (9735 pounds) were extracted during 1895, more than 1750 pounds less than during 1894. This decrease was due to the rainy summer. Eleven pounds of iridium were found in the district of Orenburg.

IN its recent session in Denver the International Mining Congress named a committee of five to revise the United States mining laws and report its results to Congress, and subsequently authorized the president to increase the committee by adding one representative from each of the mining States not originally represented on the committee. Accordingly President L. B. Prince has named the following: W. S. Keyes, California; F. J. Newlands, Nevada; W. S. Haskins, Idaho; W. A. Clark, Montana; G. B. Dennis, Washington; W. B. Potter, Missouri. The original members of the committee are: J. E. Todd, South Dakota; G. J. Moore, Colorado; R. A. F. Penrose, Arizona; F. A. Reynolds, New Mexico; Lamar Cobb, Georgia. The committee will meet at Denver, September 7th.

DR. KEITH, formerly of this city, now of London, claims to have invented a new cyanide process, in which in the dissolving process he adds to the solution of potassium cyanide a certain amount of cyanide of mercury. He states that he finds the best results obtained when the solvent contains 0.05 per cent of potassium cyanide and 0.025 per cent cyanide of mercury. This mixture of cyanides, he claims, operates faster than the simple potassium cyanide. The process for the recovery of the gold from the solution is an electrolytic one. The gold and the mercury are deposited together upon amalgamated copper plates. The amalgam so deposited is scraped off and the gold recovered by distilling off the mercury in the usual way. The anode is not allowed to dip in the cyanide solution, but is placed in a separate compartment and surrounded with a solution of an alkaline salt, so that the cyanide does not become decomposed. The electro-motive force of the current need not be more than half volt, and the current density on the depositing surface may be as low as 0.06 ampere per square foot.

A GOOD anti-friction and preserving compound for mine cables is as follows: Soft tallow, seven parts; plumbago, three parts; mix thoroughly; make a long, hollow box or trough; gouge out a 4x6 piece of scantling about two feet long; saw it down lengthwise and hollow out the box or trough enough to hold several pounds of the compound, making a hole lengthwise of the trough for the cable to run through. Affix to rope and clamp securely; have the box or trough so fixed that it cannot play, and let the cable pass through it while going up or down, so that it will get a thorough coating. This will preserve a round cable very well, and can be used at least once a week. For a flat steel cable raw linseed oil can be used instead of the tallow, in about the proportion of six parts of oil to three of plumbago. When tar is used, linseed oil should be added to keep the tar from adhering, both ingredients to be mixed while warm.

IN the Beam process, now occasioning considerable notice in Colorado, the furnace consists of a series of muffles, constructed of firebrick and tiling. The ore is first crushed to a forty-mesh and then put in the muffles, from which the air has been excluded. The roasting is then begun and is kept up until the chemical combustion takes place when hot air, or oxygen, is introduced, which changes the sulphides to sulphates and thus saves the value. The time of the roast runs from one to three hours, and the cost is claimed to be less than 50 cents a ton. A low degree of heat—not more than 400 to 500 degrees Fahr.—is required. After the roast the ore is pulverized to a 70 or 80 mesh and is then treated by pan amalgamation. The owners' claim for the process is that the ordinary fire assay does not show the value of the ore, while the Beam process prevents loss by volatilization.

AN important case is that of the Union Oil Co. of California, now before the Interior Department. It was heard last fall by Secretary Hoke Smith, and it is now before Secretary Bliss on review. The question involved is as to whether oil lands are mineral under the United States statutes. In this case the lands are a part of those patented to the Atlantic and Pacific Railroad Company, the statute granting them excepting in terms "mineral lands." Sixty oil land patents were issued on these lands, and on the last day Secretary Smith was in office he decided that this exception only embraced metalliferous minerals, and that oil lands therefore belonged to the railroad company and were not subject to patent. This decision embraces not only oil, but alum, asphaltum, borax, marble, kaolin, coal and similar minerals. The oil companies have already expended considerable money, and the other minerals included within the terms of the decision will make the amount involved reach into hundreds of thousands of dollars in Western railroads. The attorneys for the oil company feel confident of securing a reversal of Secretary Smith's ruling. The decision will be of great importance throughout the State.

A Sample Warehouse for American Goods in Caracas, Venezuela.

Plans for the establishment of an exhibition warehouse in the city of Caracas, Venezuela, have been matured, and the National Association of Manufacturers is now ready to receive applications for space in the building which has been secured for the purpose. The warehouse is designed to serve as a permanent exposition of American goods and as a headquarters for salesmen visiting Venezuela in the interest of exhibitors. The aim of the Association in establishing this warehouse is to stimulate trade between the United States and Venezuela by familiarizing the merchants of Venezuela with the American goods which they can purchase to advantage. This warehouse is being established under the terms of a special concession granted to the National Association of Manufacturers by the Government of Venezuela. This concession gives the privilege of entering goods free of duty when intended for exhibition in the warehouses of the Association in Venezuela, duty to be paid only in case of the actual sale of the goods. This privilege, the high favor with which all things American are regarded in Venezuela, and the large variety of American-made goods which are salable in that country, make the conditions exceptionally favorable for the inauguration of such an enterprise. Prominent business men in Caracas have taken active part in the preliminary work of establishing this warehouse, and the Venezuelan Government has manifested a lively interest in the project and has indicated a disposition to aid in every practicable manner in making the enterprise a complete success. As this is the first of an extensive system of similar depots which the National Association of Manufacturers contemplates establishing in various foreign trade centers, it is desired that this warehouse shall be in every way a model institution of its kind. The plans for its organization and management have been carefully formulated, and the exhibits will be confined to those lines of goods for which there is a known market in Venezuela. There are many articles of American manufacture which it would be useless to attempt to sell in Venezuela, and exhibits of such goods as these are not desired. The entire enterprise is planned upon a basis of practical benefit to its participants, and it is believed that any manufacturer who shall make judicious use of the advantages afforded will be abundantly compensated for the expenditures of money and effort.

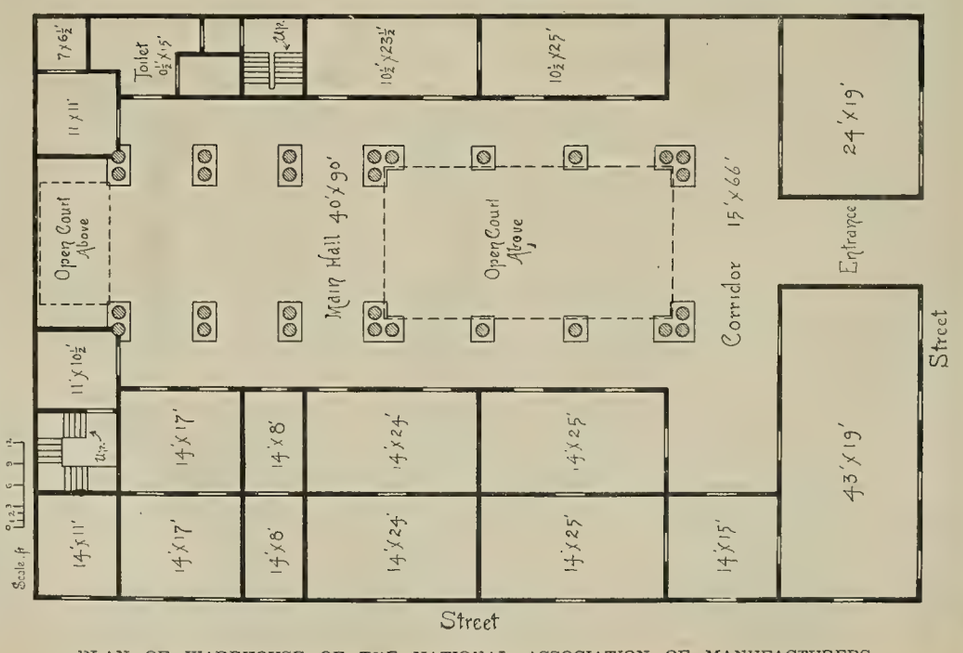
THE CARACAS WAREHOUSE OF THE NATIONAL ASSOCIATION OF MANUFACTURERS.

INTERIOR VIEW OF WAREHOUSE OF THE NATIONAL ASSOCIATION OF MANUFACTURERS.

The warehouse will enable intending buyers to examine under favorable conditions the various lines of American goods for which Venezuela affords a market. They will be able to examine actual merchandise—not illustrations or models. Buyers will be able to obtain all desired information about the goods, their cost, manner of sale, etc., and they may also compare them with other similar goods with which they are more familiar. While the actual sale of goods is not contemplated as one of the functions of the warehouse, buyers will be assisted to reach the manufacturers through the recognized channels of the importing and commission houses. Buyers will have access to the catalogues of many manufacturers not represented in the exhibit and will be placed in communication with the makers of any particular article which they may desire to obtain.

For the exhibiting manufacturer it will afford a continuous display of samples under conditions which will ensure careful attention from intending purchasers. It will serve as headquarters for representatives of the exhibitors who may visit Venezuela for the purpose of selling goods or investigating the market. To such representatives the facilities of the warehouse will render invaluable assistance in the shape of information and advice concerning trade matters. The warehouse may be made to serve as a bonded storehouse for the storage at reasonable cost of goods intended for sale in Venezuela, and can act as forwarding agent for goods held in bond, attending to the entry, payment of freights, duties, etc. For the training of salesmen for work in Venezela or any other of the South American Republics, the warehouse will prove an admirable school, as it will afford an excellent opportunity for the study of Spanish-American trade conditions and methods of doing business. In the collection of information of value to those who desire to do business in Venezuela the warehouse will be able to render service of much importance. It will be within the province of the warehouse management to gather complete and reliable data upon such lines as selling price of various articles, cost of these goods, where they are purchased, their quality as compared with American goods, import duties in Venezuela, freight rates to Venezuelan ports, how goods should be packed, quantities imported annually into Venezuela, the extent of the possible trade, etc.

It is not intended that this exhibition warehouse shall be operated with any view to profit by the National Association of Manufacturers. It is designed to be only self-sustaining. The charges for space range from $5 down to $2 per square foot, the price being based upon the amount of space used by the exhibition, with a minimum charge of $25 per annum for the smallest amount of space taken. Each exhibitor will be entitled to free use of the facilities of the warehouse, in addition to the mere privileges of exhibition, in proportion to the amount of space used.



PLAN OF WAREHOUSE OF THE NATIONAL ASSOCIATION OF MANUFACTURERS.

The Alaska Gold Fields.

By RUSSELL L. DUNN, Mining Engineer.

The placer gold deposits of the Klondyke and Yukon river basin, generally, are similar in origin, in the conditions under which the gold is found and in largeness of yield, to the placers which have been mined in the Amoor and Lena river basins in Siberia for fifty and more years past. In all, except as to the perpetually frozen condition of the auriferous sands and barren overburden, these Arctic placers are similar to the Australian placers, are similar to the Idaho and Montana placers, such as the famous Alder Gulch, near Helena, and to some of the gulch and ravine placers of California—for example, Rich Gulch in Calaveras county, Auburn Ravine in Placer county and Greenhorn and Humbug creeks in Siskiyou county. Everywhere the origin of the placer gold is the same. It is gold liberated by the erosive agencies of frost and running water from its rock matrix in the lodes, principally quartz, which have been formed by the chemical action of mineral-laden water ascending from the heated interior of the earth through fissures and fractured zones of the outer crust. The action of frost is principally in breaking the lodes in place into fragments, which are then moved away by running water, thus exposing fresh rock surfaces to the frost. In running water in the stream channels the grinding together of the rock fragments gradually wears away and liberates the gold. In accomplishing this, the brittleness of the rock matrix, the toughness of the gold resisting abrasion, and the surfaces of structural weakness where the gold and rock come together, all facilitate the freeing of the gold, which, once freed, works its way downward toward the underlying rock, and, once there, stops at the first inequality in the surface. Its movement then is very little, for very small particles of gold cannot be moved by quite strong currents of water over the slightest obstruction. It only moves and changes position, always downward, as the bedrock of the stream channel wears slowly deeper till it reaches a level where it no longer cuts the rock deeper, but spends its erosive energy in widening the channel portion of its basin. Thus are made flat valleys of erosion many times wider than the flowing stream. Gold does not flow or float, excepting only very thin, light scales, and what is known as flour gold. Even these will settle in such moderately strong currents as will wash coarse sand away. Gold grains and nuggets are only moved by running water while they are portions of comparatively large rock fragments, pebbles or boulders. Just as soon as the rock fragment becomes so diminished in volume by abrasion that its normal specific gravity becomes increased by the higher specific gravity of the attached gold particle, its movement by the running water becomes more and more retarded, until the gold particle, finally liberated, stops and joins the slowly growing accumulation at the bottom of the stream channel, while its once matrix is swept onward as sand to the sea.

Glaciers have had comparatively little to do with the liberation of gold from its rock matrix. The glacial epoch in all the noted placer gold localities takes in but an insignificant fraction of the time that has been occupied in the formation of the placers from the lodes. In California the evidence of the placers themselves is conclusive as to their almost exclusive formation by frost and stream erosion alone. The California placers commenced to form as early as what geologists term the Cretaceous period and their formation was continuous through the enormous intervals of time represented by the Eocene, Miocene, Pliocene, and throughout the much shorter interval elapsing since the close of the Pliocene down to and including the present time. Of all these enormous time intervals of gold accumulation, glacial action has only covered a small fraction of the last and shortest—the Postpliocene period. It only covered a small portion of the territory of the placers, contributing possibly an insignificant fraction of the gold that has since been mined out. Siberia and Alaska present precisely the same relative glacial phenomena. The placers were practically all formed before the age of glacial action, precisely as the California placers were formed, by the action of frost and running water. The Glacial age has followed this enormously long period of placer formation, and holding on in both countries, but more particularly Alaska, down into the present time, has merely acted to conserve the already formed placers in unaltered form, structurally and topographically. Glacial action has added no more to them than it did in California. The beginning of the glacial epoch in all three localities was in the age of the mastodon and mammoth, as may very surely be inferred from the perfect frozen bodies of the latter which have been discovered in Siberia during the last century. These locked up in the ice at the beginning of the epoch only now gradually reappear with the slow retreat of the ice sheet northward. The period of placer formation practically ended in Siberia and Alaska with the beginning of the glacial epoch in age of the mastodon and mammoth, for we find the fossil bones of these animals in the placers which frozen then are only now being thawed out in mining operations. In California we find fossil remains of the mastodon in the placer deposits of the old buried rivers, but the long-ago northern retreat of the ice has given the time period during which the living rivers and streams have made additional placers, both indirectly from portions of the old buried river placers and directly from the breaking down of fresh portions of the gold-bearing lodes.

California placers, too, have had an accelerated energy of formation by reason of enormous uplifts of the gold-bearing mountain ranges during and since the glacial epoch, thus increasing the fall per miles of the streams from their source to their discharge. In the great auriferous basins of the Lena and Amoor rivers in Siberia and in the Yukon basin of our own country, there is conclusive evidence that the stream flow and the topography is now just what it was before the glacial epoch. There is, too, equally conclusive evidence that during the far longer interval of time covered by the formation of the placers in Siberia and the Yukon, there was a less intense erosive energy than in California, despite identical climatic conditions, for certainly the last portion of the period. The cause of this less intense erosive energy is in the much lighter grade per mile of the drainage from the watersheds. In California the drainage has been normally torrential; in the Arctic river basins torrential drainage has been an exceptional condition. The proof of this in these latter regions is in the character of the gold and locus of the placers. The placer gold of the Klondyke and Yukon basin generally contains a very considerable proportion of coarse nuggets and grains still attached to pebbles of the quartz matrix, showing that the gold has not moved very far from its source. The placers are in valleys of considerable width relatively to their length and to the size of the living streams that have made them. These valleys have very slight falls and the streams that flow in them have even less, as they meander from side to side of the valley in downward course. These living streams have, by reason of diminished grade, lost their erosive power and now flow on beds of their own detrital accumulations, which is more often silt than the harder and coarser sand and gravel. These detrital accumulations, in depth from 8 to 20 feet, rest on the surface of an eroded bedrock which has an approximate parallelism in grade to the surface of the detrital accumulations above. On this eroded bedrock surface, under the silt which contains no gold, is the placer, which will be found linearly continuous with the valley, as a rule several times wider than the stream now flowing overhead, as a rule several times narrower than the valley overhead, and as compared with the overhead stream, having a much shorter and more direct course through the length of the valley and necessarily a less flat grade than living stream. There is nothing novel or exceptional in the phenomena described. They are precisely identical with the phenomena presented by the Siberian placers and as well by most placers the world over. The placers in the Klondyke and Yukon region are just what they are in the other localities, the old stream beds of a living stream above or adjacent. Not necessarily only one of its successive beds, made in eroding the valley, but several of them. Not necessarily, or even rarely, all of the beds, but in all probability the oldest one or several of them, for only so long as the grade remained sufficient would the stream bring gold-bearing rocks to its bed and liberate the gold there. Naturally, as the stream successively cut new beds its grade diminished with the greater length of these channels in the widening valley. The typical Klondyke and Yukon placer is thus one or more old stream beds so situated as to indicate that it is not the result of a torrential erosion nor likely of a very deep erosion of the earth's surface nor of a very distant erosion. The contrary conditions of all of these can be safely assumed in the consideration of these placers.

If accurate records of the yields of the placers should be kept (it may be safely assumed that no records at all will be kept), other phenomena, of great value to the gold miners, would be observed. It would be found in any system of placers taking in an entire valley and its branches, in which the typical placer described was practically continuous, that, commencing at the lower end, there was a gradual increase of the gold values going up the stream, till in some section nearer the upper than the lower end the maximum was reached, from which, continuing up stream, a gradual decrease of values and their final sharp disappearance would be noted. Below the lower end of the placer, if prospecting be done, values would be found to tail out and gradually and finally disappear. Above the upper end the disappearance of value is much more abrupt, and it is at this point of disappearance that the lode source of the gold is to be looked for. It would be found, on examining a map of the valley and branches and of the placer, that the latter would extend into some of the branches, but not all of them. And if those into which it does not extend be prospected, they will be found barren of gold, from which it can safely be inferred that in them it is useless to search for a gold-bearing lode.

It will be found, if the placers of several adjacent systems in the Yukon region could be platted after being mined out, that the upstream end of the placers would very largely group themselves into definable relations with each other. This relation is due to the fact that gold-bearing lodes occur in groups or systems, often of very considerable linear extent—for example, the mother lode of California, which is a group or system of lodes seventy miles long. One system or group of lodes may thus feed the placers of several streams which, widely separated in their flow, yet head so that they have eroded the same lode system.

There is nothing phenomenal in the yield of the Klondyke placers. California, Australia, Montana, Idaho and Siberia have all had as extensive and rich placers as the Klondyke. In fact, there have been numbers of richer ones. These, long since worked out, excepting in Siberia, are for the moment being forgotten in the hopes and anticipations from the one, hitherto unknown, now in public view. It does not require any heretofore unknown sources of gold to have made the Klondyke placers. It does not require any heretofore unknown richness of known sources to have made them. Just as everywhere else, lode deposits of gold ores, probably quartz no richer than those known and mined elsewhere, have made these Klondyke placers the El Dorado of the present. The Idaho quartz mine at Grass Valley, in California, has yielded from a vertical depth of 1700 feet, and a length of about 1000 feet, $17,000,000 of gold. The natural erosion of one such lode would produce a placer as rich as the Klondyke. In California, Montana, Idaho, Colorado, Nevada and Mexico, and even on the coast in Alaska itself, lodes that have produced from $1,000,000 upward for the mining of the upper 1000 feet of depth can be named by the hundred. It goes without argument that the Yukon region can reasonably be inferred to have its pro rata of lodes equally rich in gold contents, as well as the thousands not so rich individually, but which aggregate a gold content many times more. It is from the natural erosion of these lodes to moderate depths, at a maximum not going very far beyond the first thousand feet, that the Klondyke and Yukon placers have come. From the industrial and economic point of view, while forty years have been taken laboriously to secure the gold of one Idaho lode in place, the same amount of gold, released from the lode into placers by Nature's hundred thousand years or more of slow-moving but irresistible force, can be secured by man in a tenth part of the time and with a tenth part of the labor. This craft of Nature put more than a thousand millions of gold into California placers, and there is, in my opinion, reason in the anticipation that in the Yukon placers another thousand million will be found, all things considered, as easily and even quicker to be secured than was the thousand millions of the California placers.

Recapitulating the preceding discussion, the essential conclusions on the Yukon gold fields are:

1. The placers are derived from the direct erosion of gold-bearing lodes in place by frost and flowing water.

2. The placers are the beds of the first few cutting channels that the living streams made in eroding the flat valleys they now flow in. These old beds, lying side by side, aggregate a width several times the living river, but at the same time have several times less width than the valleys. The old beds preserve an approximately direct course through the linear extent of the valleys and have the same grade as the valleys. The old beds are not exposed at the surface, but are covered with from 8 to 20 feet of silt, so that there is no surface indication of their locus beneath the silt. (This is the type of placer—there are, of course, modifications of it likely to be found.)

3. The richness of the Klondyke placer discovery is likely to be equaled by many discoveries yet to be made and is possible of being exceeded in richness by some of them.

4. The lodes from which the gold of the placers has come are for the greater number at or about the up-stream end of the placers. The lesser number of them may be, however, considerably farther down stream, and some even exist wholly within the placers. These lodes have not been eroded very deeply, and so closely are they connected with the placers, that richness in the latter furnishes a presumption of richness in the former.

5. Certain popular opinions, and some so-called expert ones as well, are absolutely to be rejected as erroneous. The gold was not broken out of the rock and distributed by glaciers. If it was in Alaska one would naturally search for gold in moraines and not in flat valleys, far away from them. Gold does not "flow" now and never did; otherwise it would be in the living rivers as much as in the others. Every valley and flat in the auriferous region does not contain placers. All of the bedrock underlying a valley in which a placer has been found is not a "placer;" it is not possible to find gold everywhere in such valleys as the Klondyke, for example. The entire length of a placer is not of possible equal richness nor is the locus of the portion of greater richness an uncertain or indeterminate fact.

6. To the preceding add that the surface of the country, valley and mountain is covered with a deep,

strong growth of moss ; that the silt and auriferous sand of the valleys beneath the moss is perpetually frozen to the bedrock; that from these physical conditions, the methods of prospecting for placers and lodes employed elsewhere are impossible of application here; and one has clearly in view the special and in part unique mining conditions of the Yukon gold fields.

Like California in the early days, these new gold fields are called "poor man's diggings." In the respect that labor commands very high wages and that for some few of the men who work to discover for themselves there is a quickly made fortune, this is true. In the sense that the chance of rich discoveries is equal to all, or as possible for all, as in California in early days, it is not "poor men's diggings." In California in early days all the capital a man required was his ability and willingness to work, and all were on an equality as regards knowledge of and skill in mining. In the Yukon even a poor man must be a small capitalist to have even an opportunity to mine for himself, and the equality of knowledge of mining no longer exists. Yet, despite the disadvantage of the comparison, the country is far more desirable for poor men in search of fortune than South Africa or Western Australia. It is as well more desirable to capital seeking investment than either of these.

Technical knowledge of the occurrence and distribution of placer gold is reasonably exact and comprehensive. It is not now in this time necessary to depend on blind luck for discoveries. It is possible now with our accumulated experience to explore for gold placers without the expenditure of the enormous amount of waste work formerly an unavoidable incident of the business. Some profitless work is inevitable, but the amount of this can be brought to its economic minimum as it never has been brought before in a new district. The intelligence exists, and can be made use of, to keep the exploration for gold limited to localities where it is possible for the gold to be found. Systematic placer prospecting, certain in the accuracy of the results it gives, can be done in these gold fields. The placers, first found, are practically the guides to lodes, some idea of the probable values of which can be formed from the placers, and risk and uncertainty in quartz mining brought to a minimum.

The present method of exploitation of the placers is slow and expensive, as fire must be employed to thaw the frozen ground a few inches depth at a time. This is not, however, the only practicable or economic method. It is possible to modify methods in use elsewhere so that the summer heat can be utilized for thawing, and the summer water flow utilized for a large part of the pick and shovel work now necessary. The exploitation of the quartz, when discovered, requires but slight modifications from common practice, and should be but little more costly than in California, and certainly considerably less costly than in the Transvaal and West Australia. There is no special industrial or economic reason why the exploitation of the Yukon gold fields should not be highly profitable to both labor and capital, with less of risk of the failures of individual enterprises, part of the history of gold mining elsewhere.

A CURIOUS state of things was recently observed in the tunnel of the underground railway of Budapest on account of lack of ventilation. For a stretch of more than two miles there is only a single ventilator, which is entirely insufficient, and the trains running through the tunnel compress the air within like that in the gun barrel of a Zalinski dynamite gun. It is stated that on several occasions the cars were raised bodily from the tracks by the pressure of air and gas, and the passengers were almost suffocated. Steps have been taken to increase the number of air shafts, so that there will be at least ten of these in each mile, and very large exhaust fans will do away with the danger of insufficient ventilation, which now renders the employment at the same time of the two tracks in the tunnel absolutely dangerous.

A NEW process for closing up the pores of aluminum and brass casting, to prevent sweating under water or steam pressure, is as follows : First melt some paraffine wax, contained at a temperature of about 168° to 183° Fahr., then add pure black rubber, which is cut in small pieces and stirred into the wax in the proportion of about 10 to 20 per cent. Leave this to boil for about twenty-four hours, taking care not to heat the wax to a temperature which will burn the rubber. The castings are then put into the hot mixture and left for about twenty-four hours. The exact temperature to which this wax should be heated is greatly a matter of experiment, and cannot be definitely stated.

THE current issue of the London *National Review* has a long article upon the success of the American Bimetallic Commission. The article confirms what has already been cabled on this subject and says: "It is now generally recognized by all except ostriches that Great Britain's chief contribution will be the reopening of the Indian mints, which all who appreciate the question must regard as a splendid subscription to the common pool."

A Yukon Miner's Outfit.

Written for the MINING AND SCIENTIFIC PRESS.

The would-be miner of the Yukon gold fields, should he follow all the instructions and advice so freely published in the dailies concerning what his outfit should be, could not help discovering in the event of his survival despite it, that he might have been saved much needless trouble, expense and suffering. Writing from a personal knowledge of the mining and climatic conditions, it is suggested to those proposing to go to the Yukon region at the present time to consider carefully the outfit described in this article. It is assumed in preparing it, that for the next year it would be exceedingly unwise to go there placing any dependence on a certainty of obtaining what was required from the trading houses in the country. The demand on their supplies is sure to be more than can be satisfied from them, so that the wise gold seeker will go prepared to be independent for a year. For convenience in considering, the outfit is divided into three parts, clothing, subsistence and tools and micellaneous.

Clothing.—Those who have never wintered in the Arctic regions have no conception of the intense cold it is necessary to protect against. This lack of realization is doubtless responsible for the absolute insufficiency and uselessness of what is offered as a Klondyke clothing outfit by San Francisco clothiers. Most of it is for service just about as useful as mosquito-bar netting would be, as I have seen it somewhere described by one who, like myself, has known what the icy blast of the far north does when it comes. It is winter that one must think of in preparing, not summer. For clothing, then, take the following:

3 Suits moderately heavy wool underwear.
3 Heavy wool overshirts.
9 Pairs heavy wool socks.
1 Heavy wool sweater.
2 Pairs pantaloons (one of stout, moderately heavy cloth for summer wear, the other of a lighter, close-woven cloth, which should be quilted with cotton batting a half inch thick in the seat and over the thighs and knees for winter use).
2 Pairs stout overalls; one felt-lined.
2 Vests.
1 Cloth sack coat.
2 Jumpers.
1 Coat of wool cloth.
1 Coat made of skin dressed with the hair on. The latter should be turned inside. For material, short hair, coarse wool or sheepskin is excellent, and should not be expensive. For those who desire it, this coat can be made of deerskin with the hair outside and lining of squirrel or cat skins.
1 Wide brim felt hat for summer.
1 Fur cap, hair outside, large enough to pull well down over the head and with fur-lined ear flaps.
1 Wool neck scarf.
1 Scarf or belt to draw coat tight around waist in cold weather.
1 Pair heavy leather boots with nail protected soles for summer.
1 Pair rubber boots, leather soles, nail-protected for summer work in water.
2 Pairs boots made of deerskin, hair outside, reinforced leather sole sewed or pegged on, not nailed. The tops should extend above the knee and be laced tight there. They should be large enough to take in the foot covered with two pairs of socks or with one pair and felt moccasins and to take in the legs of the quilted pantaloons. The top of the boot need not be lined with fur.
3 Pairs seamless felt ankle moccasins.
1 Pair light shoes or boots for indoor wear; while not necessary, is desirable. Leather is useless for winter footwear, as the intensely cold air goes through it as readily as water through a sieve.
4 Towels.
2 Pairs heavy wool blankets.
1 Fur robe for sled travel and sleeping outdoors; should be six feet square and outside cloth covered. Coyote or fox fur will answer, and, equally well and less expensive, sheepskin such as suggested as material for the coat.
20 Yards mosquito-bar netting for veiling to protect face and neck from mosquitos in summer.
1 Sheet light-weight rubber waterproof cloth 12 feet square.
2 Leather or deer-hide packing cases for portion of outfit not in use and for small articles; size 9x28x38 inches.

In addition, there should be a small lot of repair materials—needles, thread, buttons, buckskin, shoemakers' awl and wax, boot-sole nails, etc. If good material and good workmanship be put in this clothing outfit, only a small part of it will require replacement for the second year's stay.

Subsistence. — Naturally, individual tastes make wide differences of opinion as to what should constitute the supply of provisions, and the range of selection is much wider than with the clothing. Life in the Yukon is not at all a picnic. One going there eats to live, not lives to eat. The list suggested, it is believed, will answer excellently for the necessaries :

300 lbs flour.
70 lbs germea.
20 lbs rice.
150 lbs bacon, boneless, sliced, packed in tin.
100 lbs Bayo beans.
80 lbs potatoes, peeled, evaporated.
70 lbs dried soup vegetables.
100 lbs dried fruit, stoned and peeled, and seedless raisins.
25 lbs dried beef, chipped, in tin.
25 lbs tea.
80 lbs sugar.
5 lbs coffee extract.
20 lbs condensed milk.
40 lbs butter.
40 lbs lard.
20 lbs salt.
5 lbs beef extract.
2 lbs pepper.
10 lbs baking powder.

Germea is selected in preference to oatmeal because containing nutriment in a more condensed form, and because it is a very quickly prepared dish. Avoid carrying waste—for example, the bones and rind of bacon, the stones of fruit, etc. All the articles which are compressible have compressed. Have, as far as practicable, all packed in sealed rectangular tin cans of a uniform, convenient size for use and packing. The main considerations are to reduce bulk and weight.

Tea is far preferable in the winter cold to coffee, and can be taken in the Russian way, without milk. From the dried soup vegetables and beef extract a considerable quantity of soup can be made at one time, frozen in cakes, and then used as needed. To prepare it, thaw and heat over fire, adding water to thin to taste.

The weight of the preceding is 1162 pounds net ; with cases it will amount to about 1250 pounds. For convenience in handling the packages should, as far as practicable, be of uniform size and weigh from 50 to 70 pounds.

The necessary utensils for kitchen service are the following :

1 Stove and pipe, the latter in flat sheets, with seam edge crimped for joining.
1 Fry pan, with folding handle.
2 Pots, with cover and bail, sizes so as to nest.
1 Kettle.
1 Small teapot, to prepare tea the Russian way, using the kettle as a samovar.
3 Pans for bread baking, sizes to nest together.
3 Soup plates, blue or granite ware.
2 Cups, blue or granite ware.
1 Can opener, table knife, fork, tea and soup spoons.

To save weight and for ease in cleaning, aluminum ware is very much to be preferred for the cooking utensils. To keep the bulk down, care should be taken in selecting the several articles so that they nest together.

Tools—

1 Gold pan.
2 3½-lb. picks, with large eye.
3 Handles for same.
1 Shovel.
1 American ax.
1 Hatchet, hammer-head, claw.
1 Blacksmith hammer.
1 Flat file.
1 Timber saw, for getting out lumber.
1 Crosscut hand-saw.
1 Rip hand-saw.
1 Brace and bits.
1 Drawknife.
1 Saw set and file.
1 Square.
1 Jackplane.
30 Pounds 12-penny nails.
20 Pounds spikes.
2 Pair 8-inch strap-butts.

Miscellaneous—

60 Pounds candles.
10 Pounds soap.
1 Pound listerene. This the writer has found particularly valuable in the cold North for medicinal use. It does not freeze, so is always ready for application. It is particularly efficacious in curing cuts, bruises and the effects of frost on the nose and ears. Externally applied, it is a remedy for sore throat, and, internally, for bowel troubles. A small roll of surgeon's plaster, antiseptic gauze dressing for wounds, and an assortment of medicines in the form of pellets and capsules, particularly laxatives and remedies for dysentery.
A combined rifle and shotgun and ammunition.
Fishing tackle and hooks.
100 feet of ¾-inch hemp rope.

The list looks long and the bulk very considerable, yet there is not an unnecessary article in it. If, however, several men propose to travel together and work in partnership, only a small portion of the kitchen outfit and tools require duplication. Some game and fish may be taken, so that the use of the full quantity of subsistence suggested may not be required; but it is far safer to provide the full amount than to chance success in getting game.

It is a noticeable fact that the great majority of the people rushing northward not only are without experience in mining, but are without experience in outdoor life. It is difficult for them to realize the significance of a list of requirements such as the preceding. It will hardly deter any of them from going; yet the mere contemplation of it will be sufficient to the informed miner, accustomed to prospect and mine in California, Colorado and elsewhere in the States. Here his outfit at the most only requires a burro or horse to pack it, and he does not have to "put money in his pocket." To some of those who go now in the search for gold in the icy North the reward in the end will prove to have justified their action; but will it to the many? Anyway, if you must go, go prepared to preserve life and health and to mine without unnecessary useless waste of time, which in the Yukon is both valuable and costly. To accomplish these things, be sure in preparing to have as efficient an outfit as money will buy. An injudicious economy in it is liable to be costly in its results, and dependence on what is being offered as an outfit by most of the advertisers is only a form of premeditated suicide.

IN 1803 Tasmania's native population was 7000 ; today there is not a single representative left. In 1842 the Maoris of New Zealand numbered 140,000 ; today there are less than 30,000. When Macaulay's New Zealander gazes on the ruins of London there will be no New Zealander ; the name "Maori," even, will be as unfamiliar then as is now the name of some obscure Germanic tribes of the times of Tacitus. What is true of New Zealand is rapidly becoming true of all the islands of the Pacific ; it is true of nearly all the North American continent and of large areas of the Southern.

NICOLA TESLA this week says he has reached a solution of an electrical problem on which he has been working for a lifetime—the simultaneous transmission of messages by means of the earth's electrical currents to as many scattered points on the surface of the globe as may be desired. Tesla gave last Tuesday an exhibition in miniature to a few friends, which he regards as satisfactory. He will soon write of his discovery in technical terms for the benefit of science.

Reduction of Zinc-Gold Slimes.

At a recent meeting of the Chemical and Metallurgical Society of South Africa the following notes on the reduction of zinc-gold slimes were presented by E. H. Johnson:

Reference has frequently been made by different members of this society to the losses that occur in the reduction of the gold from the precipitate obtained in the zinc process, and to the unsatisfactory grade of bullion produced. Although some rather severe criticisms have been passed, up to the present little or nothing has been said how these alleged losses are to be avoided. Much of this criticism has, I think, been based on somewhat ancient history, and scarcely bears on modern practice. I have an impression that the reputed auriferous wealth of smokestacks and the El Dorados of ash heaps would require a great deal of patience to discover. It must be admitted, however, that the methods of "cleaning-up" and subsequent reduction varies so much in different works, that a discussion on the subject might lead to more uniformity of method, and possibly to some improvement in this portion of the work. It would be well, also, if from the various methods now in use a system could be evolved which might be generally adopted. If this could be done, all works—whether large or small—would be more likely to be fitted with the full equipment necessary for carrying on this operation. As a case in point, frequent reference has been made to the necessity of filter presses, yet how few works, even now, possess them. I do not propose in this little paper to introduce anything novel, but rather, by describing my own methods to induce criticism and consequent discussion, and thereby succeed in throwing more light on this much maligned subject. As the Princess works does not possess the luxury of a filter press, I have converted one of the two 6-feet diameter "cleanup" vats with which the works were originally supplied into a filter vat, by putting in a grating, having holes 1 inch square, covered with fine, closely woven canvas. Through the side of the vat below the filter bed a 1½-inch pipe is led, connected with a small suction pump bolted to the side of the vat. From the delivery of the pump, a light removable launder leads the fitered solution back to the top of the precipitation boxes. The zinc-gold slimes, including such small fine zinc as may have passed the grating which supports the zinc in the boxes, is bucketed direct into the filter vat, and as soon as one box is "cleaned up" and the washed zinc replaced, the pump is started and the solution returned by means of the launder back into the box. I may here remark that although the filtration is somewhat slow, a perfectly clear solution is returned to the boxes. I do not consider it advisable to hurry the pumping, as the partial vacuum formed below the filter cloth would be liable to burst it. The pump is kept going after the boxes are completely cleaned up, until only the slimes are left on the filter. A water wash is then added and pumped through until the slimes are free from cyanide. The gross weight of the slimes, including moisture, is then taken, by weighing the buckets of moist slime during transference to a large sheet iron tray placed alongside the acid tank. The object of weighing is to determine the amount of sulphuric acid necessary to destroy the zinc. The second of the two "cleanup" vats, before mentioned, is fitted with a wooden stirring apparatus and cover. The parts are made detachable, so that it can be easily removed when action has ceased. A 3 inch pipe leads the fumes outside the building. Having found the approximate weight of slimes to be treated, sufficient water is run into the acid vat to form, on the addition of the acid, a 10 per cent solution. I find using one pound of acid for every pound of moist slime gives good result. This would be equivalent to about one and a third pounds of acid to the pound of slimes, dry. Having the requisite amount of water in the vat, the weighed quantity of acid is then added and the vat closed down tightly. The stirring apparatus is kept continually moving during the time of feeding in the slimes, which are fed in gradually in the same condition in which they were taken from the filter vat. I find it beneficial to keep up a continual stirring for at least half an hour after the action has apparently ceased. The feed hopper has a slide door of sheet iron in addition to the closely fitting cover on the top, so that by keeping the slide closed a quantity of slime can be fed into the hopper and the cover closed before letting the slimes fall into the acid. This is to keep the fumes from the operator as far as possible, as the fumes are distinctly irritating. After all the slimes are in the acid, a jet of water is turned into the hopper to wash down any adherent slimes, and everything that had been used in the cleaning up of the boxes, etc., is well washed in the same jet. The stirring apparatus is then removed and well washed in the vat during the removal. The vat is then filled with water and allowed to settle. Working with dilute acid, and not heating, I find I can get a perfect settlement within an hour. When heating with a steam jet, settlement was much more difficult. The washing is done by syphoning off the clear liquor, and filling the vat repeatedly with water, until the solution is neutral to litmus paper—usually four or five washings. It is well stirred at each refilling by means of a long wooden paddle, a rotary motion being given to the water. This causes the slimes to collect in the middle of the vat and reduces the risk of loss during syphoning—the syphon being let down at the side. A sample of the washings taken continually during syphoning off, showed on careful assay of a large sample, to contain thirteen grains of gold per ton of solution. The drying of the resultant gold slime is conducted on an open drying hearth in large cast iron enamelled dishes. The cakes are subsequently broken up and transferred to small sheet iron trays in thin layers and subjected to an increased heat. When cool, the slimes are ground, fluxed and transferred to the crucible. It fuses quietly and with but little fume, and normally yields 50 per cent to 60 per cent of the weight of slime as bullion. The average fineness of last year's bullion was, according to my own assays, 821.9 and 819.6 according to London returns. As a deduction of 2 milliemes is made on 800 bullion, this leaves an actual difference with London of 0.3 milliemes. The slag assays, after panning out the prills (of which there is very little), 23 ounces per ton, and one ton of slag has been accumulated in two years, in producing 11,627 ounces of fine gold, which is equivalent to a little under 0.2 per cent of the total gold locked up in slags. The cost of reduction, including acid, is 6.7d per fine ounce, made up as follows—taking an actual "cleanup" as a basis:

Dry weight of zinc-gold slimes....504 lbs.			
Dry weight after acid treatment..100 lbs.			
672 lbs. of acid at 4¼d	£12	12	10
66 " " borax at 37s 6d cwt	1	2	1
9 " " carbonate soda at 2¼d lb	0	1	10
9 " " fluor spar at 4d lb	0	3	0
5 bags coke at 8s 6d per bag	2	2	6
1 No. 60 crucible	1	7	6
	£17	9	9

Yield—620 ozs fine gold.....6.7d per fine oz.

The advantages of this method over the old are: The elimination of the zinc without recourse to calcination—the loss from which is so difficult of determination; the handling, except in the final operation, being of wet slime and consequent immunity from "dusting"; the time between commencing "cleaning-up" the boxes and having the bar in the safe need not exceed three to three-and-a-half days. The cost of acid, perhaps, renders this method a little more expensive, but I consider the immunity from unaccountable losses and the small amount of gold left in slags more than compensates for the extra expense.

United States Mining Laws Applicable to Alaska.

Many recent inquiries have come to the Interior Department regarding United States mining laws applying to that part of the frozen north in United States limits, and numerous applications have been made for copies of the public land laws, which, however, do not apply to Alaska. The General Land Office has taken much interest in the reports that come from the gold belt, and investigated the laws that govern them. There is no question about which statutes extend to Alaska, and these laws are applicable:

1. The mineral land laws of the United States.

2. Townsite laws, which provide for the incorporation of townsites and acquirement of title thereto from the United States Government to the townsite trustees.

3. The law providing for trade and manufactures, giving each qualified person 160 acres of land in a square and compact form. The coal land regulations are distinct from the mineral regulations or laws, and the jurisdiction of neither coal laws nor public land laws extends to Alaska, the Territory being expressly excluded by the laws themselves from their operations. The act approved May 17, 1894, providing for civil government in Alaska, has this language as to mines and mining privileges:

"The laws of the United States relating to mining claims and rights incidental thereto shall on and after the passage of this act be in full force and effect in said district of Alaska, subject to such regulations as may be made by the Secretary of the Interior and approved by the President, 'and' parties who have located mines or mining privileges thereo, under the United States laws applicable to the public domain, or have occupied or improved or exercised acts of ownership over such claims, shall not be disturbed therein, but shall be allowed to perfect title by payments provided for."

There is still more general authority. Without the special authority the act of July 4, 1866, says:

"All valuable mineral deposits in lands belonging to the United States, both surveyed and unsurveyed, are hereby declared to be free and open to exploration and purchase, and lands in which they are found to occupation and purchase by citizens of the United States, and by those who have declared an intention to become such, under the rules prescribed by law and according to local customs or rules of miners in the several mining districts, so far as the same are applicable and not inconsistent with the laws of the United States."

The patenting of mineral lands in Alaska is not a new thing, for that work has been going on all the time.

In Plumas and Sierra Counties.

Writing of a recent trip through Plumas and Sierra counties, Cal., a traveling correspondent says:

"On every hand are deserted gravel beds, shut down by the farmers of the valleys, and who now, in consequence, have to scratch hard to pay interest on their mortgages. This scene of desertion is not only at La Porte, but at S. Louis, Port Wine, Howland's Flat, Grass Flat, Gardiner's Point, Mount Pleasant, Scales' Diggins, Poker Flat, Poormans' and Hopkins' creeks, and these only make a small part of the great gravel fields of Plumas and Sierra counties. In the idle camps of these sections, all the Alaska gold hunters could find employment, were they only permitted to wash for the gold. There seems to be an anomalous and senseless condition of things in all this. The whole country is crying for gold, thousands are rushing for the frozen north to get it, and where work can only be carried on for a few months in the year, while here, their labor would no doubt be far more certain of reward, and yet all must be idle. Thousands of men and women are suffering for work, and many the real comforts of life, while here in these gravel beds is a store of golden comfort, were only provisions made for restraining the debris, which the Government should do. The Government builds levies to save wealth, dredges rivers to advance commerce, and why not build restraining dams, when it would furnish employment for 50,000 workers, whose labors would pour millions of dollars of gold into the avenues of trade annually. Every Californian should lend his influence for bringing into renewed action this hydraulic industry, and none should be more active than the farmer. If needs be, let the Government put on the miner a percentage tax, that would ensure the return of outlays. This would be a safe business proposition. If the people do not wake up to the importance of the Government taking hold of this restraining dam question, through which only the hydraulic mines can or should be worked, California is going to lose a very large population, who will seek their fortunes in the north. Drift mining don't fill the bill among these heavy placers, except in a few instances.

"The quartz mining interest of Plumas is on the advance. The lodes of this county are on the average large, and consequently furnish a heavy output of ore. Water power is abundant and facilities for reducing ore cheaply are great. To get a clearer idea of the quartz interest of Plumas, I refer the reader to the report of the Mining Bureau, which minutely details it.

"When I see the great stir for the Klondyke, with its snowy, freezing, comfortless outlook for the adventurer, and review the vast wealth in the gravel beds, as we all know them, all lying idle, it seems a gigantic error that should be corrected."

Appreciated Compliments.

To quote the kind words and unsolicited compliments weekly received from competent mining sources all over the world would fill many a page of this journal. They are, however, none the less appreciated because only occasionally one is reproduced. The following is from the Black Hills *Mining Review*, Deadwood, South Dakota, of date July 26th:

One of the best papers that comes to the *Mining Review* is the MINING AND SCIENTIFIC PRESS of San Francisco, Cal. Its greatest merit is its reliability and undoubted correctness in all matters pertaining to mining. Read in that paper, an article can be depended upon as true. It secures a great deal of mining news which is interesting, and treats every section fairly and fearlessly. It is a paper which every person engaged in the mining business should read.

ON page 121 appears the first scientific discussion of the new Klondyke gold placers that has been published since the brief article in the issue of March 20, '97, and the other articles in July, '94. So much crude stuff has been published in the daily press about "glaciers," etc., that it was felt due to the mining and scientific world that the correct facts be intelligently discussed. It is of extreme probability that when, some months from now, the representatives of the great dailies send down their conclusions and descriptions, they will substantially agree with what appears in this issue. In the possession of this knowledge far ahead is the advantage of reading this paper. The chief scientific point is the clear setting forth of the fact that the Alaska placers were formed before the age of glacial action. The point of most present commercial interest is showing where the lode source of the Klondyke gold is to be looked for.

THE tenth annual report of the Interstate Commerce Commission, an advance copy of which has been received, for the year ending December 1, 1896, contains some valuable information. Sixteen pages of the report are devoted to the import rate case, and five pages to "Railway Associations and Traffic Agreements." According to the report, during the year ending June 30, 1895, 507,421,362 passengers were carried, and the gross earnings of the railways of the United States for the same period were $1,073,371,462.

Electrical Progress.

A New Electrical Invention Applied to Road Wagons.

For three years past M. G. Caffrey of Reno, Nev., has been at work upon a new form of trolley to convey electricity from overhead wires on a vertical plane down to the power to move vehicles along any ordinary road, the wires to be strung along any ordinary line of poles similar in construction to telegraph lines. Having faith in the success of the invention, patents were obtained upon the trolley and models made. Col. H. P. Maxson went to New York, had the necessary electrical machinery manufactured by the Westinghouse Company, and, upon arrival in Reno, a wagon was constructed on which to attach it. A line of ordinary poles were set up near the Reno foundry and the dynamo placed therein. A double line of wire was placed along the poles about 17 feet above the ground, the wires being about 18 inches apart and the trolley placed upon the wires, as shown by the accompanying cut.

The problem which the inventor claims to be solved by this trolley has interested a large number of investigators, owing to several apparent impossibilities. To accomplish the end sought, and which is claimed to be fully obtained by this invention, the following difficulties had to be overcome: First—A perfect circuit must be maintained between the source of power or, the generator in the station and the point of transmission or motor wagon. Second—The contact must be constant and subject to the will of the operator of the wagon at all times. Third—The contact must be flexible enough to allow a wide divergence from the regular road, if necessary. Fourth—This contact must be of a sufficient area to transmit the necessary power without appreciable loss from this point. Fifth—The cost of construction must be low enough to enable a small amount of freight to be handled cheaply. Sixth—The motor wagon must be adapted to haul as trailers the ordinary double farm wagon. Seventh—The entire system must be adapted to use the ordinary highways without interfering with the use now made of them. These points, the projectors assert, have been fully overcome by this invention.

NEW FORM OF TROLLEY AND ELECTRIC VEHICLE.

The poles are 24 feet long and 6 inches in diameter at the small end, and were set at intervals of 125 feet along one side of the road. On the road side of these poles two supports, or "passbys," of malleable iron were fastened about 18 inches apart, one above the other. To those supports two No. 0 bimetallic wires were stretched.

These wires are the two trolley wires connected to the two poles of the generators by means of feeders, and are divided into sections, controlled by fuses, in the ordinary street railway manner. Upon these two wires the trolley runs. This trolley consists of a metallic frame, having two overrunning wheels, and underneath these are two locking wheels, which effectually prevent the top wheels from leaving the wire and still allow the frame to pass the support holding the wire on the pole. On the lower wire a similar metal frame runs. These are connected together by an insulated pantograph, or lazy tongs, provided by suitable guides. This arrangement provides for unequal tension on the trolley wires. The cable is connected to both the wheel frames and runs to an automatic reel on the wagon, which permits it to run out 200 feet, if necessary, or wind up to a short length, thus allowing the wagon to follow the ordinary road, turning or doing anything required of it. The wagon appears very similar to ordinary wagons and does not in operation cause any unusual noise or scare horses. By use of this long cable, instead of the trolley pole, the wagon can be run to either side of the ordinary road, thus being able to pass or meet vehicles without any trouble. It also permits the movement of the wagon, not only to each side of the road, but allows backward and forward movements, necessary in turning the wagon around, without disturbing the trolley.

The wagon consists of two wheels 48 inches in diameter, fastened to a shaft, geared to a motor spring suspended from shaft. This motor is a 2 H. P., M. P., Westinghouse crane type. In front of this motor a commutator controller is suspended, the handle of which is within easy reach of person steering the wagon. The front axle is trussed and the spindles are pivoted immediately next to wheel hub, with an arm extending forward about 18 inches fastened rigidly to spindle. These two arms are connected together and the connecting bar again connected to steering bar. This gives quick turning qualities with easy manipulation. The generator used was a 5 H. P., M. P., compound wound Westinghouse 500-volt dynamo.

On the trial, as reported for this paper, "a speed of fifteen miles an hour was readily reached with a load of 2500 pounds on the wheels. Perfect control, both in power and steering, was had.

"The first test was made in the building, and the body of the wagon was raised, leaving the wheels clear of the floor. The dynamo was started and the motor received the current perfectly through the newly invented trolley, and the wheels flew around at a speed of twenty-five miles per hour. This test being over, the power was turned off and the wagon taken out in the road, where the next test would be to see how the wagon could be handled and how the trolley would move along the wires, and what effect the pass-bys would have on the trolley as it passed the poles. The power was again turned on, and the wagon moved along the road at first with a speed of twelve miles per hour, which speed was afterwards increased. Not a hitch occurred in any of the apparatus, and the wagon was run up and down along the line of wires, passing from one side of the road to the other; going both forward and backward, and also turning completely around at each end of the line.

"Mr. Caffrey is receiving many congratulations over the complete success of the first trial of his invention."

Col. H. B. Maxson, who is associated with Mr. Caffrey, will proceed at once upon a plan of organization to place the new invention in general use for public road travel and freight purposes.

According to the London *Daily Mail*, English firms are indignant that the contracts for the traction plant of the London Central railway, which is to be an underground electric line, amounting in value to hundreds of thousands of pounds, have been given to Americans. The secretary of the company explains that the contracts for carriages, locomotives and machinery were given to American firms on the advice of electrical experts, who represent that the greater use of electrical traction in the United States has brought its manufacture to a higher degree of perfection and made is far less expensive than in England. Lord George Hamilton, Secretary of State for India, in reply to a question in the British House of Commons the same day, why the East Indian railway, owned by the Government, had purchased 7708 tons of rails from the Maryland Steel Company of Baltimore, said the lowest British bid was £8675 higher than the American tender.

The Midland Railway Company at its Leicester station has an electric plant for lighting the station and surrounding yards driven by a gas engine with a total capacity of 250 H. P., of which 75 is held in reserve. The engines are supplied with Dowson generator gas, which is produced from an anthracite coal costing $3.30 per ton. The station gives satisfaction from an economical point of view.

In a new alarm system the current is constantly switched from one set of wires to another, so that one battery suffices for the protection of a large number of lines. When the current strength in any line is altered, either by the severing of the wires or other interference, an alarm is given.

Scientific Progress.

To Explore New Mexican Cliffs.

Professor Libby, of Princeton university, accompanied by several scientists of repute, begun an attempt last week to explore the famous Mesas cliffs in the United States Indian reservation of New Mexico. It is expected that the task will require many weeks for its completion, and the scientific world will watch with interest the results of the experiments which the Princeton professor will conduct. The Mesas cliffs occupy one-third of the territory of New Mexico to the west of the Sierra Madre mountains, and bear great resemblance to gigantic fortresses or castles. In reality they are ponderous heaps of rocks, 700 feet in height—detached ranges of mountains. From the plains below can be seen peaks of extinct volcanoes and the tops of fertile hills, but white men have never possessed the skill and ingenuity required to scale the lofty cliffs and penetrate the unexplored regions, which are thought to abound in valuable minerals and relics of prehistoric ages. Professor Libby is a geologist and an Arctic explorer. He conceived the idea of attempting to investigate this district years ago, but no means offered until W. J. Eddy, of New York, perfected his kite machines for aerial transportation. Mr. Eddy has built a contrivance formed of four huge kites arranged in a square 15 feet apart. These kites can be sent up in the air to a height of 800 feet. The apparatus has been sent by express to the scene, and an expert in their use has been sent by Mr. Eddy to fly them under Professor Libby's direction. The plans are to send the kites into the air above the cliffs and to make them stationary. To the contrivance will be fastened a pulley and an automatic arrangement that at a proper time will drop a weight and cord to the earth. By this cord will be drawn through the pulley a small sized rope, which will be succeeded by ropes of larger size until one of the size of a cable has been hoisted and thrown across the summit of the cliffs. Then the ascent will be a matter of ease. In case the kite contrivance fails to be of avail, recourse will be had to several large mortars borrowed from the United States Government, from which rockets will be propelled, with ropes attached.

Influence of Dissolved Metallic Salts.

The June Journal of the Chemical Society contains a paper by Dr. John Ball on the circumstances which affect the rate of solution of zinc in dilute acids, with especial reference to the influence of dissolved metallic salts. It is a familiar fact that the action of pure zinc on sulphuric acid is very slow, but may be greatly accelerated by the addition of certain metallic salts. Platinic chloride is generally used for this purpose, and less frequently a cobalt salt. Dr. Ball finds that with sulphuric acid, magnesium or aluminum sulphate have no accelerating influence, that of chromium, magnesium and iron is very slight, silver is greater, while cobalt, copper and nickel sulphates have great influence and in this order. The relative maximum velocity of solution, taking the velocity of pure sulphuric acid as unity, is for the addition of silver sulphate, 9; cobalt sulphate, 18; copper

sulphate, 21, and nickel sulphate, 38. In the case of solution in hydrochloric acid the addition of manganese, lead or tin chloride had but little influence, copper somewhat greater (11), while the relative velocities for cobalt, gold, platinum and nickel were respectively 31, 39, 42 and 45. It will be seen that with both acids the addition of a nickel salt causes the greatest acceleration, and the relative order of the different methods is approximately the same, except that copper has much less influence on the solution in hydrochloric acid. Dr. Ball presents no theory of the reaction, but it is a fact worthy of note that in the case of the two metals having most decided influence, nickel and cobalt, it could not be detected that any metal was deposited on the zinc, thus forming a couple.

The Compressibility of Quicksilver.

A. F. Palmer has been investigating the pressure coefficient of mercury resistance—a matter that has some bearing on the graduation of mercurial manometers and calls attention to the discrepancy existing between the only determinations of the pressure coefficient previously published, namely, those of Barus, who obtained .00003 for the commercial mercury up to 400 atmospheres, and Lenz, who found .0002 for pure mercury between one and sixty atmospheres. In the experiments now described the mercury was carefully purified and distilled in a vacuum, and the pressures were obtained by means of the "screw compressor" of Barus, which is capable of indicating pressures up to something over 2,000 atmospheres. The results of the experiments are contained in two extended tables, and are further tabulated in a special chart. Taking B as the increment to unit resistance of one atmosphere increase in pressure, the equation obtained is as follows:

$$B = -.0000332 - 5 \times 10^{-9} t.$$

where the last term, owing to its extreme smallness, is probably only approximately accurate. This result is very closely that of Barus, and the difference can be accounted for by the slight impurities in the commercial mercury used by him.

LIQUEFIED CARBONIC ACID is now produced so cheaply that its use for motive power for such purposes as driving light carriages is often considered. A difficulty encountered is the great absorption of heat, and consequently loss of efficiency through the refrigeration of the engine, as the liquid expands and returns to the gaseous state. A French inventor, M. E. Rassimier, seeks to avoid this difficulty by passing the carbonic acid through capillary tubes in a chamber heated to 120 degrees (248 degrees F.) by petroleum or coal-briquettes, the heated gas being then admitted to the engine cylinder, where it acts upon the piston, and is then led into a chamber or jacket surrounding the liquefied gas. The gaseous acid giving up the necessary heat to change the liquid acid to the gaseous form of 30 degrees C., a pressure of 75 atmospheres is developed. The final exhaust of the gas takes place from the jacket or chamber. The capillary heater ensures the first expansion of the gas, while the addition of pressure through the heating of the reservoir by the exhaust gas takes place only when the engine is working.

IN the minds of some students the question of migration of forms is frequently confounded with that of the migration of tribes. It must not be forgotten by those who are carefully studying the origin of industrial forms on the Western World that there were daily mails delivered on the American shore from the Eastern Continent from the remotest antiquity. The United States navy has been dropping bottles overboard in the Atlantic ocean, at the Azores, in deep water along the coast of Spain and from the Madeira and the Canaries southward along the coast of Africa. All of these bottles that have been recovered have been found on the coast of South America, on the Antilles, and some of them as far west as the mouth of the Rio Grande. It can be inferred from this, therefore, that every buoyant object which has been dropped into the ocean during the present geological epoch by prehistoric or historic Spaniards, Portuguese or Africans has found its way to America and been stranded somewhere between the 10th parallel south and the 30th parallel north. In the northern part of the Atlantic ocean the currents run the other way and the mails have been delivered from America to Europe. In the Pacific ocean the daily mails delivered on the west coast of America from Mount St. Elias southward have proceeded from about the 20th parallel north, in the vicinity of the Malay Peninsula and Archipelago, thence have traveled through the China sea and the Japanese sea to pick up objects designed for the Western Hemisphere. In the Southern Hemisphere the mails travel the other way, and materials consigned to the Ocean Current Company were taken from Chili and Peru to be delivered upon Easter island and the various groups of Polynesia, some of them reaching as far as Melanesia.

Mechanical Progress.

Water Power Under Pressure.

IN the MINING AND SCIENTIFIC PRESS of the issues of June 5 and June 26, '97, appeared an article by Mark Replogle on the limitations of the governor in water power plants, which has elicited considerable interest among engineers.

In this regard is noted in the issue of the *Engineering News* of July 8, '97, an article by John Richards of San Francisco on water-ram in the supply mains of hydraulic power plants, which is of cognate value.

On the Pacific coast, says Mr. Richards, where pipe lines under heavy pressure are often miles in length, and sustain pressures from 100 to 300 pounds per square inch, or even more, the subject of water-ram becomes of great importance, especially where the consumption and flow are variable.

The common conception of water is based upon its visible mobility, and it is hard to conceive of it as a solid, which, when confined, is as inelastic as steel, and whose momentum in a long pipe is the same as that of a bar of iron of the same length and weight.

These long pipes contain sometimes hundreds of tons of water, the movement of which is more difficult to control than that of a ship of equal weight moving in the water.

For constant supply there is but little difficulty from water-ram, but when a considerable part of the water under high heads is subject to sudden and extreme fluctuation, water-ram has become a serious fact, and gives rise to phenomena first made known to the world, in practical form, by Riedler's "Versuche auf Pumpen."

Observations made at the Comstock mines about sixteen years ago by Mr. William B. Eckart, and the expensive experiments of the Risdon Iron Works of San Francisco, in dealing with pressures of 600 to 700 pounds per square inch, would, if published, furnish some startling facts in respect to water-ram. At the Comstock mines in Nevada, where enormous heads of water were dealt with, 10-inch pipes with walls 2½ inches thick were torn to pieces as if made of paper, and the main uptakes became safe only when provided with a nearly continuous parallel line of air vessels. This experience preceded the work of Riedler, and except a paper of Mr. Joseph Moore, read before the Association of Engineers in Glasgow, a year or two later, no account of these experiments and work has found its way into hydraulic literature.

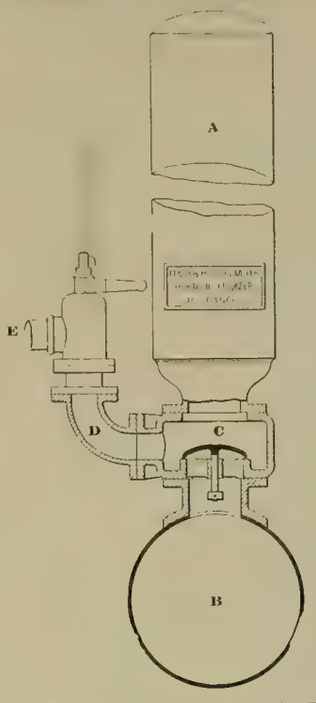
When the velocity of flow is even slightly checked in these long lines of high-pressure pipes provided with common air vessels, the rythmic pulsations of varying intensity are set up, producing variations of pressure in extraordinary amount. Thus the regulation of the speed of water wheels becomes impossible within the limits demanded in the generation of electric current. If the water is shut off in proportion to the changes of the load, pulsations are set up which produce periods of racing with the wheels, and abnormal strains in the pipes and connected vessels.

The expedients which have been adopted to obviate these troubles have been to deflect the jets of water, or a part of them, so as to miss the buckets or floats of the water wheels; to use large air vessels and to place numerous air vessels all along the supply pipe lines.

The deflection of nozzles from wheels, however, is wasteful of water, and the air vessels, while they may preserve the pipe line from rupture, are probably the cause of the pulsations of pressure referred to.

Mr. E. S. Cobb of the firm of Cobb & Hesselmeyer, engineers, of San Francisco, who in some recent practice found this difficulty of water-ram to contend with, has prepared a method of dealing with it that may interest the readers of *Engineering News*.

Mr. Cobb proposes the employment of what may be called single-acting air vessels, which are illustrated in the accompanying cut. A



A Non-Return Air Vessel for Hydraulic Power Conduits, Designed by E. S. Cobb, San Francisco, Cal.

is a common air vessel attached to the pipe line B, and provided with a valve C, opening freely inward, but closing by gravity as soon as there is an equilibrium of pressure between the pipe and the air vessel, thus preventing any return flow or resilient action of the compressed air in the vessel A.

Above the valve C is a discharge or waste pipe D, provided with a loaded valve E, that opens by the water pressure at some predetermined point and permits the escape of enough water to restore an equilibrium and permit the valve C to again open with a change of pressure.

Our New York contemporary devotes several columns to editorial comment on the subject in general, using Mr. Richards' article as a text, of value as illustrating the present wide interest in the use of water power under high heads and its development on this coast, the last notable instance being the plant of the Pioneer Electrical Co. of Ogden, Utah, fully described and illustrated in our columns last week.

What a Submarine Boat Can Do.

When engaged in harbor defense duty its position will be outside the outer line of harbor defense—that is, beyond the range of the guns defending the entrance. While performing this duty it will lie awash—that is, with only the top of its turret over the surface of the water. On the approach of an enemy's vessel the smokestack will be shipped and the aperture on top of the turret through which it passed will be quickly closed watertight. She will then run in a direction to intercept the enemy's ship, still remaining in the awash condition until she comes near enough to be discovered by the lookouts on the ship, when she will go from the awash to the entirely submerged condition. The distance from the ship at which she must dive will depend on the weather. In rough weather she can come quite close without being observed.

Having come within a distance that the operator estimates at two or three hundred yards from the ship, the diving rudders are manipulated so as to cause the top of the turret to come for a few seconds above the surface of the water. During this short exposure of the turret—much too short to give the enemy a chance to find its distance and train a gun on it capable of inflicting any injury—the pilot ascertains the bearing of the enemy's ship, alters his course or makes another dive if necessary. If he finds that the submarine boat is within safe striking distance, say 100 yards, a Whitehead torpedo is discharged at the ship. A heavy explosion within six seconds after the torpedo is expelled will notify the operator that his attack has been successful, and he may then devote his attention to the next enemy's ship that may be within reach.

When the boat is running on the surface of the water, with full steam power, and it becomes necessary to dive quickly, the pilot gives the order "Prepare to dive." The oil fuel is instantly shut off from the furnace, the valves are opened to admit water to the water ballast tanks, an electric engine draws down the smokestack and airshaft into the superstructure, and moves a large massive sliding valve over the aperture on the turret through which the smokestack passes. These operations will be completed in about thirty seconds, when the boat is in the awash condition and prepared to dive. In twenty seconds more it will be running horizontally at a depth of 20 feet below the surface of the water, and quite beyond the reach of the enemy's projectiles.—John P. Holland, in the Marine Number of Cassier's Magazine.

To Preserve Boilers.

For the preservation of boilers when not in use an order has been issued to the French navy, which is thus abstracted in the Journal of the American Society of Naval Engineers.

The boilers will be completely filled with fresh water. In the case of large boilers with large tubes, there will be added to the water a certain amount of milk of lime, or a solution of soda may be used instead. In the case of tubulous boilers with small tubes, milk of lime or soda will be added (but the solution will not be so strong as in the case of the larger tubes), so as to avoid any danger of contracting the effective area by deposit from the solution. The strength of the solution will be just sufficient to neutralize any acidity of the water. Care must also be taken to preserve the outside of the steel or iron tubes in the case of boilers, which are not to be used for long periods. To this end they will be painted with red lead or coal tar as far as it is possible to reach. For those places which are inaccessible, a protective coating will be obtained by burning under the tubes a certain amount of tar or coal tar, whose smoke will form a coating of soot and thus prevent the air from reaching the surface of the tubes. In addition, the boiler casing will be closed and kept air-tight after placing inside some quicklime. Periodical inspections of boilers thus treated will be made, to insure the complete filling of the tubes with water.

J. W. HALEY of Milford, Me., has invented a self-lubricating bearing that it is thought will prove useful. It consists of a compound of metal and graphite made in such a way as to hold the graphite in solution, which is said to have never been accomplished before. All the metals used will fuse at a much lower temperature than will vitrify glass, which requires 4000 degrees Fahr. These metals are thoroughly mixed while in a powdered form, and combine before the glass becomes liquid. They are then pressed into the journal, and make a hard and self-lubricating bearing, and one which cannot be melted out by any friction that could occur, as it will stand a red heat. glass alone makes a journal that will run with less oil than babbitt metal, but it is too brittle. Mr. Haley makes his journal of glass, lead and graphite, which renders it self-lubricating. For light shafting he uses a little antimony; for large shafting with its increased pressure he adds powdered brass and aluminum.—Chicago Journal of Commerce.

SOME workmen can distinguish iron from steel by the musical note emitted on striking. A more certain method, however, consists in using dilute nitric or sulphuric acid. If the surface remains unaltered or nearly so when touched with a drop of either acid, the metal is iron, but in the case of steel a black mark will be left, owing to the liberation of carbon.

Mining Summary.

CALIFORNIA.

Amador.

The management of the Amelia Mining Company, Jackson, have purchased a boiler and engine from the Ford mine near San Andreas, and are now putting it in place preparatory to sinking 500 feet.

Record: F. Sullivan and E. H. Young have made an agreement with Parker & Thomas of the Live Oak mine on Stony creek to work on that property. They are erecting an arrastra. They have about 2 feet of ledge which will produce about $100 per ton.

Republican: At the Zeila the chlorination works are in operation and the entire plant is again in operation after several months of enforced idleness caused by the necessity for repairs.

Good rock is coming from the Valparaiso mine constantly. One of the richest specimens of rock to be seen hereabouts is from this mine. It is an oblong piece worth $500.

The mortar blocks for the mill at the Argonaut will be put in place next week. The old tunnel has be cleaned out, bulkheaded and locked. The tunnel is about 800 feet long.

The shaft at the Oneida is now down over 1000 feet and will be continued to a depth of nearly 2000 feet.

At the Alma thousands of gallons of water are handled daily. Drifting is being prosecuted.

The Kennedy continues to turn out its regular quota, the clatter of its forty stamps never ceasing.

Water still interferes with sinking at the Anita mine.

Butte.

Five new stamps will be added to the Carlisle mine.

Good ore is being taken from the lower levels of the Golden Queen mine.

The Costa Company at Cherokee has received a permit to mine by hydraulic means provided they impound their debris.

Register: The Stow tunnel was run in 1900 feet and then they went back to the 1600-foot station and began an upraise, which is now up 450 feet. Mr. Stow has 550 feet more to go to tap the lower level in his mine. The upraise is going ahead about 100 feet a month, so that before the close of the year the upraise will be finished. One hundred and twenty-five men are employed.

The Missouri mine, owned by the Texas Company, is under the supervision of H. P. Stow and Henry Beik as foreman. They have fine rock in the ledge they are prospecting. The ledge is one mile north of Forbestown.

The Bank of England ledge is under the supervision of C. D. Antrin. There are two tunnels on the ledge and work will soon be resumed, which has for a time been suspended.

Mercury: Work was commenced earlier than in previous years in the river, and on account of improved elevators and the steel derricks used work was greatly facilitated and pumping was commenced in the beginning of March. In thirty-one days they pumped out the water, sunk the elevator to bedrock, and have washed 180 to 200 feet of bedrock, nearly as much work as has been accomplished in an entire season with the old appliances. They employ good labor and pay promptly and rustle all along the line.

Kern.

Placer diggings in the eastern regions of Kern county are being generally worked with dry washers.

A 10-stamp mill at Garlock is making a thirty-day run on ore from the Skookum at Randsburg. The Gold Bar and Hand Bower, near Johannesburg, have been bonded by Hollis and Curtis, and work begun.

Three mills are running on ore from the Wedge mine. The Wedge is now down 400 feet and the ore is richer than ever. At the 415-foot level the company will put in a gasoline hoist. The Wedge is the deepest developed mine in the Rand district.

F. E. Gladwyn, manager of the Three Chimneys mine at Keysville, has a gold brick valued at $1144, taken from four tons of rock from the mine, without the use of the concentrator, and says the mine shows a large body of ore of the same quality. The Three Chimneys mine is one of the group at Keysville, which was such a famous mining locality thirty-five years ago. Keysville is about seventy miles northeast of Bakersfield.

Nevada.

Last week, says the Grass Valley *Telegraph*, the Wisconsin mine had another rich cleanup, as it has been in the habit of doing for some months past. This time only twenty-six loads of ore were put through the Joe Southern mill and the result was a yield of $78 per load. This mine is looking better as underground developments proceed.

Placer.

Sentinel: Merrithew & Williams have commenced work on their river claim on the north fork of the American river, south of Gold Run.

The Hermit Con. M. Co. are working their mine near Michigan Bluff. Their main tunnel is 5x7 feet and is now in 1900 feet.

At the Paragon mine, at Bath, twenty-six men are now employed at the mine. The number of men working for the mine is sixteen. W. H. Grennell is superintendent. Ten men are working leased ground. The mill is running twelve hours per day.

At the Hidden Treasure mine, at Sunny South, the company is working at the Dam tunnel, the main tunnel being in over 7000 feet. Fifteen men are engaged at the new electric plant works, built in El Dorado canyon, 12,000 feet from the mouth of the Dam tunnel. Water for power will be taken from the Hidden Treasure tunnel at Sunny South, conveyed in a ditch one-half mile, where a pipe line, 1860 feet in length with 850 feet pressure, will run the 200 H. P. Pelton wheel. Two dynamos will be used to generate a current of 160 H. P. Two wires are used for the circuit to the mouth of the Dam tunnel, where a trolley line will propel trains of cars in and out of the main tunnel. The return current of electricity will be carried on the rails. A "rail-bond" makes this possible. Besides running the trains, power will be furnished for operating the blowers and a saw with which to frame timbers. There will be a surplus of power to run the pumps when the company sinks and commences to breast gravel on their lower blue channel. The new plant will compel additions to the boarding house and lodging house, as the company intend to employ a much larger force. The Hidden Treasure Company has over two miles of channel to work, and when the electric plant is in operation the mine will be operated upon an extensive scale.

At the Pioneer mine, eight miles south of Towle, the property of a Boston company, who purchased the mine from Fair & Davis of San Francisco, the new company will work the mine upon a large scale. After securing the mine, they commenced the work of driving tunnel No. 4 to strike the ledge and pay chute at the 1000-foot level, 500 feet below the former lowest working tunnel. Last May the pay chute was encountered in Lynn vein in the new No. 4 tunnel. The length of the pay chute is 160 feet. An average of $21.75 per ton was secured from all quartz crushed in June. Compressed air is conveyed by a pipe line of 1400 feet to the mouth of tunnel No. 4, and thence about 3000 feet into the mine, where stoping is in progress. Power drills are used to mine the quartz. The company has fifty-three men on the pay-roll; J. J. Sullivan is superintendent.

Tidings: Mr. Wiltse, who formerly superintended mines at Grass Valley, went to South Africa a few years ago and was fortunate enough to make a snug fortune. He returned to California about a year ago and has made several purchases of mines, mostly in Placer county. He bought a half interest in the Gold Blossom mine, at Ophir, from C. F. Reed, and the company are making extensive improvements there and have a paying mine. He also bonded the Drummond mine, near Forest Hill, owned by Mr. Reed. Recently he made a sale of the Gold Run, Limited, to a London syndicate, and the company are making preparations to work the property, which consists of a channel four miles in length, by both drifting and hydraulic process. Mr. Wiltse's operations have added a new impetus to mining in that county.

Riverside.

The *Recorder* says the work of installing the cyanide plant at Kenworthy mine in the Tanquitz district is nearly completed.

The Tin Mine Grant Syndicate in the Gavilan mining district, has erected a 20-stamp mill on its property and will have a syanide process plant in operation soon.

A new stamp mill is in operation near Perris, on the property of M. E. Bethurum. A 20-stamp mill is being arranged for by the Gavilan syndicate and the Riverside Gold Mining Company.

Sacramento.

Record-Union: The trouble of the Internal Improvement Company, which for the past three years has conducted the large placer mine at Michigan Bar in the eastern edge of Sacramento county, seems to have reached a climax. Besides a mortgage for $55,000 which has just been ordered to be foreclosed, a swarm of smaller claims have been filed including claims for wages, which have been placed in the form of attachments upon a string of sluices throught which the hillsides reach the river. The Michigan Bar or Hill Top property was formerly fabulously rich, and twenty years ago the monthly cleanups averaged $10,000. A great deal of pay dirt still remains, and in the future it may be made to pay, and the principal reason for the present failure is said to be that more money was expended in improvements than the output of dust warranted.

San Bernardino.

Twenty-five men are working on the Green Lead and the mill starts up this week.

San Diego.

U. S. G. Todd has organized a company to develop the Bay Horse and Irma gold mines in the Mesquite district, after having purchased the interests of various owners in the claims.

Los Angeles *Times*: The mines at Escondido, which hereafter will be known as the Rincon del Diablo mines, it is evident from present appearances, will be operated on latest improved methods and developed in a practical manner. Under the management of B. P. Little, active operations began some days ago, and twenty men are now employed retimbering shafts, erecting substantial hoisting works and placing a new mammoth boiler and engine in place. An assay office has been completed, also a tool house and shed for concentrators, which will be put in below the amalgamating tables. The old mill will be used for the present, having been repaired and improved. The first work will be to sink shafts to greater depths than the levels formerly worked.

Shasta.

There is a good deal of excitement over a strike just reported in Ellery Bros.' mine—the Three Sisters—in Dutch gulch, near French Gulch. Some time back the Ellerys took $40,000 out of one shaft; but the ledge pinched out and the property has been idle for a long time. Recently J. L. Cannon, formerly foreman at the Niagara mine, went to work at the property under a six months' lease. He went into the shaft and ran a drift east on the vein. He had drifted but 6 feet when he found pay ore. The ledge is 18 inches in width and is very rich in free gold.

The company owning the lime quarry on Little Backbone creek, near Kennet, has been selling and hauling lime rock by wagons to the Keswick smelter for fluxing. The wagon method of transporting the ore being too slow, a survey has been made with a view to putting in a wire ropeway. It will be about two miles in length and operated by gravity, as there is a fall of 1500 feet in two miles. The expense of construction is estimated at $10,000.

Dog Creek letter in Redding *Free Press*: T. E. Johnson of San Jose, who owns the Gold Hill property in Trinity, has bought a stamp mill. The ore assays from $20 to $200 per ton in free gold. The ledge has already been traced to a depth of 71 feet and has an average width of 4 feet on top.

Courier: The Ellery or Three Sisters mine, near French Gulch, which produced so well for a while, is coming to the front again. Since the ledge pinched it has been idle, until John Cannon began operations lately. He has struck ore said to be like that the mine formerly produced.

Siskiyou.

J. B. Tonkin has leased the R. S. Fagundies mine, mill and water right in Salmon River district for two years. Mr. Tonkin will open an unexplored portion of the ledge and expects the quartz to be fully as good and probably better than has already been extracted.

The Quartz Valley mill has been in operation lately under the management of Wm. Steele. Operation has been chiefly on custom work.

Yreka *Journal*: The American Bar mine on Klamath river made a good cleanup a few days ago, although not as good as they have done in the past. The Chinese claim near Hamburg Bar is one of the busiest on the Klamath, and it is believed the Chinamen have made it pay well, although they are very reticent. The mines on French creek and Sugar creek are said to be doing splendidly this season. Wm. Grider, who has a fine claim near Sciad, is doing some good work, and has taken out quite a lot of dust this season. It is the only hydraulic mine running in that section. The Chinese company working the claim above Calkins' place on Greenhorn, getting short of water, is now preparing for next season to be ready for the winter storms. This claim is reported as paying very well, and is worked in a good systematic manner by open cuts, with steam power to do the hoisting, pumping and other heavy work. The hydraulic mines on the lower Klamath have nearly all been closed down during the past two weeks, but several will again be in operation in a few days as soon as their machinery is repaired and other obstacles which prevent their operation are removed.

Sonoma.

A contract has been let for a road from Healdsburg, Cal., up Pena canyon to the Grizzly copper mine, recently located, and as soon as it is completed the ledge will be developed. The owners of the mine are satisfied that it can be profitably worked.

The Healdsburg Onyx Mining Company, capital stock $100,000, will develop the ledge located on Austin creek, ten miles from Healdsburg. A. B. Nally, one of the principal stockholders, says that $10,000 worth of the stock has been sold, and this sum will be expended in preliminary work.

Trinity.

The severe strain of the past four weeks has worn out the pumping plant of the Altoona quicksilver mine, and, although of sufficient capacity to keep the mine dry under ordinary circumstances, it is not large enough to rely upon in cases of emergency. "We have expended," said President Allenberg to the Redding *Free Press* last week, "$30,000 in pumping out that flood of water, and I am now en route home to confer with my associates as to the advisability of putting in a larger pumping plant. The shaft will be stripped and all the old hoisting and pumping machinery taken out. Work upon this undertaking was begun Monday. We will probably put in a new hoisting plant and pump. The plans for both plants are already prepared, and, although the pump will have to be constructed, it will require but two weeks' time to do the work. The improvements contemplated will necessitate the expenditure of a large sum of money, but the mine when in operation is a good producer and we will never abandon it."

Tuolumne.

Democrat: At the Patterson tunnel No. 2 is to be retimbered and put in shape for future use, after which the level will be continued north.

At the Grizzly the new shaft is 90 feet, while 310 feet deeper down is the objective point. The work is being carried along in a strong 8-foot ledge, which mills on an average $10 per ton.

The Soulsby will shortly resume operations.

Everything is almost in readiness to work the Seminole group of mines.

Yuba.

The Webb Mining Company who have been pumping the old Pennsylvania mine at Browns Valley, have at last bottomed the shaft.

NEVADA.

The Douglass mill at Dayton, which has been working tailings, has shut down on account of low water. The mill put through 200 tons a day from the time it started.

The reported success of the process which saves the flour gold of Carson river has started a miniature Klondyke excitement in Douglass county.

The quartz mine of the Alder Creek Co., at Blue canyon, is about to be developed on a large scale. Supt. Balliet is constructing several buildings and will put in an 8-stamp mill. He will also put in concentrators. The mill will be run by water power. The company has a finely developed ledge that prospects well.

At Golconda the name of the Adelaide Mining Company of twenty years standing has, under the new management, been changed to that of the Glasgow and Western Exploration Company of Glasgow, Scotland. J. Hennessey of Park City, Utah, is the general superintendent. He has the contract of sinking a 300-foot working shaft, which he expects to complete within ninety days. From the 100-foot level a drift has been run 168 feet, of which 40 feet are in ledge, averaging 55 feet in width. The first 30 feet are solid ore, then come 8 feet of barren rock, when the next and last 2 feet, so far worked, again disclose a solid body of even higher grade ore. This drift passes under a portion of the old workings. The shaft is of the double-compartment kind, each 5½x5½ feet. Outside timbers measure 7x14 feet. The quality and quantity of the ore to the ton: Copper sulphide, 10 to 20 per cent; gold, 2 to 7 per cent; silver, 5 to 12 ounces.

Times: The Davis leaching plant at Dayton, which has been running on river material of the Carson River Dredge Company, has so far worked about 900 tons, and it has proved that there is a fair margin in the working of the tailings. About 60 tons per day are handled by the plant, but some delay has been caused by the dampness of the material, and it is now being hauled out into higher ground to dry. This will somewhat increase the cost of handling, but this loss will be more than made up by the more rapid working of the material in a dry state and a higher percentage of extraction. The material is low grade, but there is an endless quantity of it, and a small margin is all that is necessary to have the enterprise prove a paying one, which it is now doing.

WHITE PINE COUNTY.

The North Mountain Company's mill at Egan is crushing fifty tons a day.

The mill at Robinson, when completed, will be 236x26 feet.

The Star & Grey Eagle Company are pumping from the Star shaft 1200 gallons a minute, and will soon be through.

OREGON.

Hale Bros., says the Jacksonville *Times*, are making arrangements to equip their mine on Harris Flat, Josephine county, with pipe and giant. A new ditch, which is expected to furnish them with water for eight months in the year, is being built.

The Alexander & Bent mine (formerly known as the Ennis & Cameron) in Galice creek district, has, it is reported, again changed hands. The price was $75,000, $5,000 down and the balance in payments ranging from two months to one year.

F. A. Baker, E. S. Reed., R. B. Miller, J. F. McCartney and W. H. Hearn have organized at Portland the Gall's Creek Mining Co., with a capital of $60,000, to work the old placer claim of the Pfell Bros., on Gall's creek, near Gold Hill, which they lately purchased for, it is said, $8000.

WASHINGTON.

The *Spokesman-Review* is informed that the Clarks and their associates will erect this fall a milling and cyanide plant near the Republic, in the Eureka camp. They have already secured water rights on Granite creek and surveyed a route for a flume. If this mill goes in this fall it will result in a big boom for Eureka as well as for the whole Colville reservation, for quartz showings of a similar character are reported throughout the Sans Poil and Curlew valley. With the opening of the reservation it was overrun with prospectors hunting for iron caps and copper showings, no attention being paid to the white quartz showings. It is thought that the Eureka quartz can be transported to water and milled for less than $2 a ton. Everything is open to the visitor. He can go on any property and sample and investigate as he sees fit.

BRITISH COLUMBIA.

The new 200-ton blast furnace of the Hall mines smelter at Nelson was charged for the first time this week and will be used for smelting copper ores. The ore bins are full and the mine is now turning out 200 tons a day.

Last week the deal started two months ago for the sale of the Lexington group in the Slocan was consummated by a first payment of $1,500, and the transfer to the McCunes was recorded, says the Spokane *Review*.

M. J. Burns, superintendent Lullus mine, Trout Lake district, has arranged to ship a car of ore to Nelson. The ore is gray copper and galena and the pay streak is about 8 inches, averaging about $100 to the ton.

The 10-stamp mill at Horsefly mine, B. C., in charge of John Hobson, was started July 10th. Drifting will be continued all winter. The walls of the mill are 4 feet thick, with tar paper between. Its construction required 80,000 feet of lumber. Thirty men are employed.

(Special Correspondence).—Lieutenant Governor McIntosh of the Northwest Territories is the authority for the statement that work on a smelter at Robson will begin within six months. It is the popular notion that the C. P. R. will make Robson the smelter town of Kootenay. The company own the country at Robson. Besides country, there is a great water power in the Kootenay river at that point.

F. A. Heinze of the Trail Smelter and the Columbia Western Railway says he has offered the Le Roi Company a site on his railroad above Trail, all the water power they need, and a rate on ore from mine to smelter as low as Corbin of the Red Mountain Railway will give them.

The Le Roi people, including United States Senator George Turner, are all Spokane people, and their American friends and they would like to locate their smelter at Northport, on the American side. It is expected that Heinze's offer will be passed upon at a meeting of the company this week.

The Canadian Pacific also took a hand in this smelter contest and called on Heinze to make a railroad rate that would meet the

American road's tariff. The C. P. people say the Rossland-Trail ores must be smelted on this side. They offer a low rate on coke from Nanaimo, Vancouver island, until the Crow's Nest Pass Railroad is built, and then a better one.

James Breen, who built the Trail smelter and one at Durango, Colorado, will build the Le Roi smelter. He believes in locating it on the Canadian side, on the Columbia river.

Sir Charles Ross, the Scotch baronet and promoter, is pushing the work on an electric power plant at Middle Falls, on the Kootenay river, seventeen miles above Robson. He, Oliver Durant of the Center Star and Charles R. Hosmer of the C. P. telegraph line are the pushers of this electric scheme. They expect to have the power house built, dynamos set and wires strung into Rossland in four months. They will first furnish power to the Center Star, but not exclusively, as they advertise their readiness to furnish it to the mines generally. The capacity of the plant will be 10,000 H. P. The length of the transmission line will be at least thirty-six miles, ten miles greater than the distance from Niagara Falls to Buffalo. Ross says the cost of power to the mines will be reduced 50 per cent. An interesting question is involved in this enterprise—its commercial success. L. B. Stilwell, electrical director of the Niagara Company, says the transmission of 1000 H. P. twenty-six miles is still an experiment, and until he has had actual experience in transmitting a block of 5000 or 10,000 H. P. that distance he has no opinion to express upon its efficiency. The Kootenay promoters seem to take it for granted that they can successfully transmit 5000 or 10,000 H. P. thirty-six miles. They could have located nearer Rossland, but from the point selected they can reach Nelson, Kaslo, Slocan City and Sandon, making their plant the great generator of power for West Kootenay.

Trail, B. C., Aug. 3, '97.

(Special Correspondence).—The Credit Lyonaise, a French syndicate, is prospecting the British Columbia M. & M. Co.'s property, which is bonded for $20,000. In addition to other work, four diamond drill holes have been put down from 90 to 160 feet, each proving the ledge to be about 20 feet wide for at least 1700 feet. The ore, which is gold bearing, free milling and low grade, is being treated by the cyanide process at the reduction works.

The Chinese hydraulic mine on Cunningham creek, which was bought by the M. & M. Co. last winter for $16,000, is being thoroughly prospected under the management of R. J. Sawyer. Two and one-half miles of ditch has been dug and 1000 feet of pipe is on the way from Ashcroft.

All the hydraulic claims near here have done well, though the season was short owing to the light snow fall last winter, followed by hot weather in the spring.

The Cariboo Gold Fields, Ltd., has about fifty men employed, chiefly on ditching.

Johnson & Fry, who purchased Shaw's drifting diggings on Hardscrabble for $5000 last spring, are running a tunnel from the level of Willow river to drain the lower end of their ground.

McCloskey Bros. have struck pay gravel on Antler creek, near Sawmill Flat.

Laird, at Willow river, has replaced the machinery destroyed by fire some weeks since, and is drifting into the channel.

The Slough Creek Co. is getting some gold in the work being done to reach bedrock.

The 10-stamp mill at Horse Fly (Hobson's) has been started up on a large bank of cement gravel.

Barkerville, B. C., Aug. 3, '97.

(Special Correspondence).—If it were not for the all-absorbing query, "Can I get to Klondyke?" the British Columbia mines would be receiving more public attention than they are, for results demonstrate that many of them owned on the seaboard are going to be big winners. The Athabasca of Nelson district, a free milling proposition, owned in New Westminster, B. C., and Toronto, Ontario, has shipped seventy tons to the Hall smelter and received gross returns of $5280. The Golden Cache in Lillooet district, said to be the richest free milling proposition in the Province, have their 10-stamp erected and will commence crushing on Aug. 15th. The Alpha Bell Company, adjoining the Golden Cache, have the identical vein of the Golden Cache and are 25 feet in the same ore on their main tunnel. Ashcroft, the post-office town of Lillooet, is growing. The American Pulverizing Company are locating a plant there. On Taxada island, near Victoria, B. C., the Victoria Taxada mine has produced a brick from fourteen tons of ore—free milling—worth $900, and has men developing the mine. At Phillips Arm, near Vancouver, a number of claims have been bonded for from $10,000 to $100,000. On Harrison lakes, close to New Westminster, the Providence mine, close to the water's edge, is shipping ore with good paying results. The prominent properties at Fairview Camp, Okanogan, are being well spoken of just now. The Smuggler stock has been taken off the market. The Tinborn mine has 1500 tons on the dump. Their 20-stamp San Francisco mill is being installed. The vein in No. 1 tunnel has widened from 4 to 29 feet. The company claim that their ore averages $65 and that their vein cuts the mountain in two. The Winchester has two shafts sunk, one 40 and the other 50 feet. The surface assays are the highest yet made in the camp—$75. Besides this shaft work there are 600 feet of crosscuts. The Comstock Mammoth Company are running a tunnel to crosscut two ledges. The cut is in 235 feet. The ledges run through the Jim Dandy-Morning Star-Brown Bear and Stemwinder, all prominent properties in the camp.

Vancouver, Aug. 1, '97.

Correspondence *Spokesman-Review*: Capt. Hall, superintendent of the Le Roi, will sink a triple-compartment vertical shaft 600 feet westward from the present hoist—800 feet before drifting to any extent is done. A hoist of corresponding capacity is to be erected, and double-decked cages put in, which will give a capacity of about ten times that of the plant now in use. This will be the central main working shaft, though the present one will still be used. To complete this undertaking will require about a year's time, though it can be used before the depth mentioned is attained. The mine is working a staff of 175 or 180 men, about 125 of them being below ground. More would be put on if skilled hands could be obtained. The mine is turning out from 250 to 300 tons a day, all of which is shipped to Trail, and it will take about three months yet to complete the contract with the smelter there. A concentrating plant will be put up within no distant day to treat the low-grade ore, of which there is so much on the dumps.

*Rossland*er: The report of the sale of the Pilot Bay smelter to the Omaha & Grant Smelting Company is confirmed, and Wm. Braden, the Northwest representative of the company, is making arrangements for ore.

A contract has been let to build a 100-ton concentrator at the Montezuma to cost $45,000.

From January 1 to July 24, inclusive, the shipments of ore from mines at Rossland to smelters were as follows:

Mine.	*Tons.*
Le Roi	27,650
War Eagle	6,538
Columbia and Kootenay	1,275
Iron Mask	2,072
Jumbo	91
Josie	365
Cliff	457
Center Star	313
Red Mountain	56
O. K. (concentrates)	172
Evening Star	30
Giant	21
I. X. L	12
Total	39,768

Cariboo City dispatch: The new wagon road to Mineral City is now completed as far as Goat canyon, and it is expected that it will be finished by the 1st of September. This will facilitate matters so as to allow mines in the vicinity of Mineral City to ship ore, as heretofore they have had no means of shipping their ore except by pack horses, which necessitated an expense of $20 per ton. Up to the present time only one mine has shipped from this district.

IDAHO.

A. Klockmann, lately operating in British Columbia, has gone to Idaho and will devote his attention to the opening up of the well known Continental mine, situated a few miles north of Priest lake in Kootenay county, Idaho. Mr. Klockmann became interested in the Continental in 1893. It is one of the largest galena prospects in Idaho, having enormous ore bodies running about $60 in all values. A wagon road will be constructed from the mine to the Kootenay river, a distance of eighteen miles, and ore will be shipped on that river by boat to the Great Northern Railroad at Bonner's Ferry. Mr. Klockmann hopes to begin shipments this winter.

The Parrott mine at Sunset peak, near Wallace, has been started up in a small way after a long shut down.

In the Pierce district, near Kendrick, a promising strike has been made on a ledge which measures about 2 feet in width and panned $200 to the ton. Coming so soon after the recent rich strike made on the Musselshell and in the French creek district, has created a good deal of excitement. A noticeable feature of the recent discovery of the ledges is that they have been found in the vicinity of rich placer diggings, and as a result prospectors and miners are turning their attention towards the old diggings which made the camp famous in the '60s to look for ledges.

Princeton letter: Last week the Bishop made a strike that is considered by far to be the best looking rock yet discovered in the camp. The ore runs very high in copper and silver with a showing of free gold that, it is estimated, will go from $60 to $120 per ton. The find was made in the shaft at a depth of 58 feet and is growing better as the work progresses. The lead is between 3 and 4 feet wide, with strong indications of its widening very fast. The Bishop is the north extension to the Gold Bug.

Gibbonsville *Miner*: The mill on Pratt creek, erected the past winter by C. E. Bolton for the Goldstone Mining Company, was started up a week ago and worked to perfection.

Spokane *Spokesman-Review*'s Idaho letter: The Acme group of mines on Grouse mountain are showing up well in free gold. Considerable work has been done and the claim is well prospected. The main shaft is down 30 feet. The same character of ore as appears on the surface is found at that depth. The average of thirty-eight assays gave a value of $19.60 a ton.

MONTANA.

The Mastodon Gold Company at Mammoth, has settled its differences with the former employes, paying the labor claims, and will push development work.

The Revenue people at Norris are putting in a cyanide mill. This company, says the Marysville *Mountaineer*, has recently purchased the old Bradley mine.

There has been a revival in gold mining about Helena. Mills that have been closed down for years are now running, and others are being built, among them a 600-stamp mill for the Diamond hill mines, forty miles east of the city. The mine was sold last year to a Scotch company for $2,000,000. It has electric equipment, water power is furnished by a dam across Crow creek, three miles from the mill. The mine has blocked out considerable free milling ore running from $2 to $6 per ton.

Under date of July 5th, the general manager of the Calumet and Hecla copper mine says: "During the past fiscal year we produced mineral equivalent to 43,404 tons of refined copper; our product in refined copper was 46,237 tons. For the previous year our refined copper product was 42,776 tons. The price of copper has varied from 10¾ cents to 12 cents per pound. It is now 11¼ cents."

Herman Thofehrn, superintending an electro-cyanide plant at Iron Rod, tells the *Inter Mountain* that the plant is a success. With four men employed, it treats twenty tons of ore a day, saving 85 per cent of the gold and 50 per cent of the silver at a total cost of only $1 a ton. It is estimated that there are about 20,000 tons of tailings at the old Iron Rod mill which will be worked. The tailings will average $11. Several attempts have been made in the past to work the tailings of the Iron Rod, but, owing to the fact that they were full of slimes and extremely difficult to filter, the attempts resulted in failure.

The method of gold and silver extraction of this company is very simple and may be described briefly as a combination of lixiviation of potassium cyanide and barrel-amalgamation, both the solution and deposition of the precious metals being aided by a weak electric current. The ore, in a finely divided state, is charged into a barrel, or cylinder, so supported as to admit of slow revolution. To each ton of ore 1600 pounds of water is added, with from ¼ to ½ per cent of cyanide and a little caustic alkali, if the ore is acid. In the interior of the cylinder are slats of iron, so arranged as to mix the ore and prevent the scraping of amalgam as the cylinder revolves. The interior of the barrel is covered with amalgamated copper. The iron slats are connected with the positive pole of a dynamo and the amalgamated cylinder with the negative pole. The barrel is revolved by means of a small engine for about five hours, the cyanide solution, aided by the current, dissolves the gold and silver and the electricity deposits these metals on the amalgamated surface. The contents are discharged into a settling tank to recover the solution and any amalgam that might be detached by the action of the ore. The cyanide solution is then brought to the proper strength and used over and the tailings are run away.

Basin *Progress*: The Boulder mill has been closed to make improvements. A new vanner and three jigs are being put in.

At the Ruby twenty-five men are working on the mill. Additional men are also being put to work in the mine.

Butte *Inter-Mountain*: The hoist at the Moonlight is nearing completion. The foundation is laid for the big hoisting engine which will replace the one now in use. During the work of reconstruction the mine is being operated as usual.

UTAH.

E. D. Loose and David Evans have got the control of the Ibex mine in the Detroit district. In the transaction they secured 98,000 shares of stock, the figure at which it changed hands being quite a large one, although the purchasers decline to name the exact figure. It is proposed to do a vast amount of exploration work in the immediate future.

David Moffat has bought the Copper Queen for $11,000. Negotiations are pending for the purchase by Thos. Musgrove of the Golden Dream belonging to the estate of Capt. G. A. Jackson. The property was bonded by Musgrove, who put in a 5-stamp mill from which the most satisfactory results were derived. The first run showed a valuation of $27 per ton, the second run an average of $23 and the third $40 per ton. All of this ore was taken from 35 feet of work and at present the outlook is one of the best that has been shown in that district.

Salt Lake *Tribune*: Advices from the Grand Central at Mammoth indicate that a most important strike has been made in that property, which has been so long prospected, and that the bonanza for which they have been searching, at an expenditure of over $100,000, is about to be developed. Within the last few days the management has run across a big body of ore running $120 in gold and six ounces in silver per ton. There is not a speck or spot of copper stain in it. No matter from what part of the ore body samples are taken the assay value only varies $1 from the highest to the lowest. On the level at 400 feet, they have a 2-foot vein of steel galena which assays eighty-five ounces silver, 16 per cent lead and a little gold. Between the 600 and 700-foot levels the management encounters streaks of high-grade ore. The big strike is on the 800-foot level.

COLORADO.

Manager Buschman of the Speedwell mine, Ouray, has just completed a 1500-foot two-bucket tram, connecting the Speedwell with the Sky Rocket mill. The new tram is designed to carry 100 tons of ore in twenty-four hours.

Colorado Springs *Telegraph*: The Octopus Gold Mining Company is probably making the best showing of any of the numerous companies at work on that section of Grouse mountain known as Little Pisgah peak. The company owns the Octopus group, consisting of four patented claims on the south slope of Grouse mountain. In a shaft sunk to a depth of 95 feet, on a promising lead, assays have been secured as high as $120 per ton. The company is composed principally of McCook and Omaha, Neb., capitalists.

Contractor William Cross is crowding the work of excavating for the foundation of the new sampling works located in the northeast part of Goldfield. The new sampler is being constructed by Colorado Springs capitalists, and the Smith-Moffat syndicate is known to be a heavy stockholder. The sampler will be 30x60 feet in dimensions, and will have a capacity for sampling over sixty tons of ore per day. The work will be pushed with all possible rapidity, and it is expected that the machinery will be in motion before the end of sixty days.

The management of the Little Montana, near the Florence & Cripple Creek depot, has up to date been unable to combat the heavy flow of water; they have been obliged to draw their pumps and abandon work until a pump of greater capacity can arrive from Denver. The shaft is now 230 feet deep.

Record: The recent average output of the Vindicator has been about fifty tons a day. Although the company has large ore reserves, the development is progressing rapidly and they are sinking the shaft intending to run another series of levels as soon as a depth of 50 feet more can be reached. One-half of the ore shipped by the Vindicator is a high grade smelting ore.

Systematic development has been the motto of the Blue Bird, Cripple Creek, for some months, and now large blocks of stoping ground have been opened up in the different levels. Two carloads of good grade sylvanite ore have been sent to the Pueblo smelters which are expected to run very high.

NEW MEXICO.

The Mesa del Oro Company, L. B. Tulley superintendent, are preparing to work the Hillsboro placers. The area includes 1,500 acres. A part of the work will be a ditch twenty miles in length from the Rio Animas to Animas peak. A pipe line 2,600 feet in length will span the Animas, and also a further extent of this pipe line about 1,900 feet in length crossing the Tank canyon. The ditch will be 4 feet wide at the bottom and and 7 feet at the top, and its capacity will be 2,000 miners' inches per second. The fall will be 10½ feet to the mile. The water to be used in washing the placers will come from a dam on the Animas. The estimated cost of fitting up the placers and putting everything in readiness for operation is about $500,000.

Raton *Reporter*: Wm. Reed reports another strike on the Highland Mary, about 11 inches wide. Mr. Reed and Mr. Biddle, manager of the property, took twenty pounds of the rock and pounded out from it $14.70 in gold. The company at once put men on to get it in shape to work as at the point of discovery it is impossible to do development work on account of water.

New Mexican: In the Chloride country ores bear copper and silver, with a little gold. The U. S. Treasury and White Eagle, one the extension of the other, have veins over 24 feet in width on the 100-foot level, and show $10 per ton value across the face. In working these claims no waste is encountered, all the stuff taken out being "pay dirt," and over 1000 tons of ore are now on the dumps. These mines are the only gold-producing mines in the Chloride district that have been discovered, the other claims producing copper and silver. The Colossal, Midnight and Silver Monument, once producers but for years allowed to remain idle, will resume work soon. The renewal of operations in silver mines is due to the demand for copper, and nearly all the silver lodes carry that metal in paying quantities.

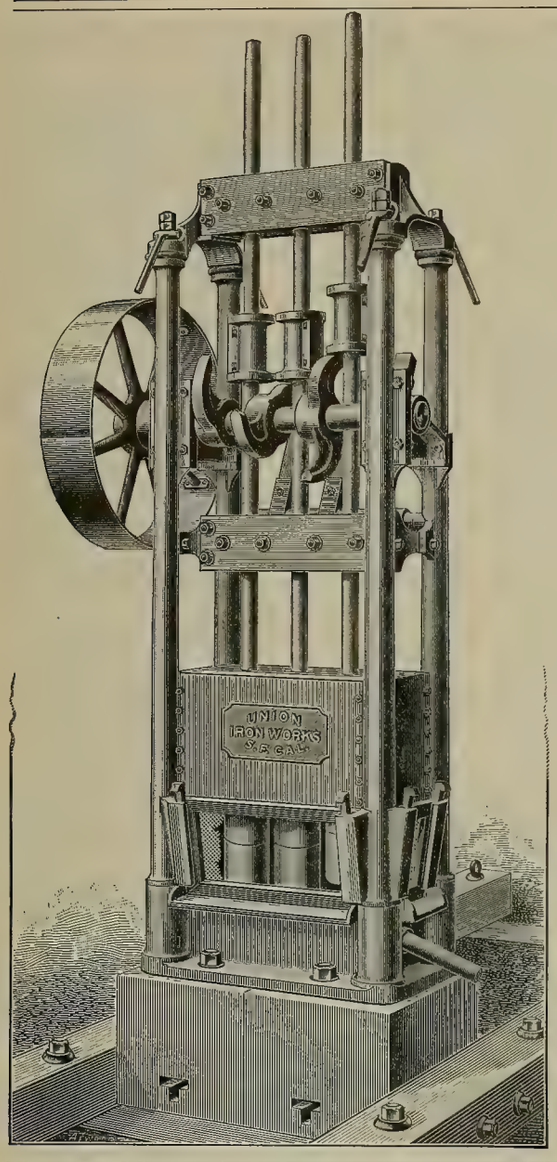
In the Magdalena district much attention is given to the lead deposits, particularly around the old camp of Kelly, and long-abandoned claims are again made to produce. I. S. Church has opened up a copper claim which is an extension of the old Iron Mask, and is doing a large amount of work. The Graphic mine and smelter are running night and day; in fact, through all the time of low prices work was not stopped.

ARIZONA.

The Rio Colorado Gold Extraction Company, capital stock $1,000,000, is incorporated at Colorado City, Colo., and has purchased twelve mines 600x1500 feet area on the east side of the Colorado river, in Yuma county, Arizona. They have a 75-foot shaft and will put on a stamp mill and work the mines.

The Crowned King is now rated, next to Congress, as the second best producer of Yavapai county. The three claims cross the western slope of a peak of the Bradshaw mountains. The development of the mine is reported unique by the *Republican*. From the southern end of the property, which contains the Silver King claim, a tunnel is driven into the mountain in a northerly direction. The extent of this tunnel is 1900 feet. It takes the course of the veins. The ore body strikes into the mountain at the Silver King claim and dips to the north. From the mouth of the tunnel, at a distance of 524 feet, is a large station. The main shaft extends from this station 400 feet. On the surface, 150 feet directly above, are the boiler and engine rooms and the hoist. A cable runs down on a direct line with the mouth of the shaft and connects with the elevator in the shaft. The ore comes up in the cars and is pushed out to the ore bins. The tunnel goes on north into the mountain 1100 feet from this station. There is a 10-stamp mill and eight 4-foot vanners. The output is about twenty-eight tons a day. The plates catch about 50 per cent and the rest is left to the concentrates and cyanide. About 150 men are employed by the Crowned King Company at the present time. This includes the entire working force. The wages are $4.50, $4, $3.50, $3 and $2.50. Miners' wages are $3.50. The mine has been in operation for nine years. N. S. Shekels is the principal stockholder. He expects to soon erect a 30-stamp mill at the mine. P. A. Johns is foreman. The tailings are being treated by cyanide. The plant has a capacity of thirty tons a day. It is only an experiment thus far. If the values extracted are sufficient to warrant it, a ninety-ton plant will be put in. Dr. J. W. Coleman and Dr. Alderdice of Prescott own the plant and treat the tailings upon the royalty plan. G. P. Harrington is superintendent at the mill and postmaster at the camp.

Republican: In running a crosscut in the Buster mine, Bradshaw mountains, a large body of copper ore has been encountered. The crosscut is over 200 feet long and 300 feet under the croppings, which latter are large, and the work was done to ascertain if the ledge went down. It has been found to hold its own, both as to extent and richness. E. D. Treadwell is superintendent of the property.



Union Iron Works,

222 MARKET STREET.

SAN FRANCISCO, CAL.

This

Three-Stamp Iron Frame Battery

WAS MADE BY THE

UNION IRON WORKS

FOR THE

NEVADA METALLURGICAL WORKS.

The stamps weigh 350 lbs.

The total weight of the battery is 5000 lbs.

The weight of the heaviest piece is 1300 lbs.

Capacity, five tons per day.

The COLORADO IRON WORKS CO., Denver, Colo.,

ENGINEERS AND MANUFACTURERS,

Beg to draw your atttention to the introduction of the . . .

FINLAYSON PATENT WIRE ROPE TRAMWAY.

It is of the double rope pattern and the newest and best thing in its line ever placed on the market. The automatic features, simplicity of construction, ease of running and economy in operation places the

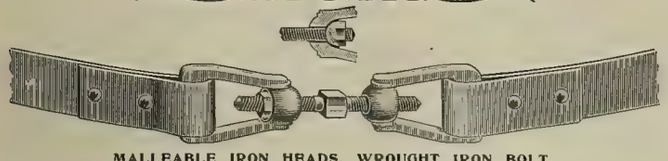
Finlayson Tramway

far ahead of all other systems of aerial ropeways. It is unsurpassed in tonnage capacity. It is on the principle of "You push the button and the machine does the rest." If interested send for special catalogue.

Our Line of Manufactures includes all kinds of Modern Equipments for the Successful Milling and Smelting of Metalliferous Ores. Special Catalogues on Application.

PATENT HOOP CLAMP.

ALL SIZES.



MALLEABLE IRON HEADS, WROUGHT IRON BOLT.

These couplings are easily applied. They are the best—most powerful. They have a direct pull, working freely with right and left screw on ball and socket joints tangentially to curvature of the tank. The turn-buckle principle of these clamps makes them lasting favorites with all who have once tried them. We use them extensively in our tank-building department.

ORE VATS,

PRECIPITATING TANKS,

SOLUTION TANKS,

FILTER BOTTOMS,

ZINC BOXES, ETC.,

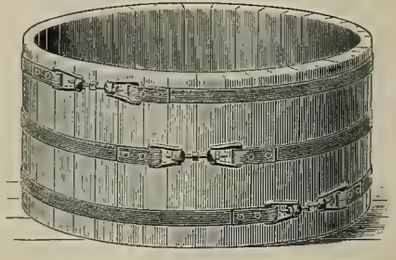
For Hyposulphite and Cyanide Leaching Plants.

PAN AND SETTLER STAVES,

BATTERY GUIDES,

—AND—

Water Tanks of all Sizes.



WELLS, RUSSELL & CO., Mechanics' Mill, Cor. Mission and Fremont Sts., San Francisco, Cal.

Coast Industrial Notes.

—Hawaii has excluded the Chinese.

—The San Francisco revenue office reports collections for July as aggregating $450,000.

—The 44th Annual State Fair at Sacramento, Cal., begins Sept. 6th and closes Sept. 18th.

—The Sierra, Cal., Telegraph Co. has incorporated, to build along the line of the Sierra Railway Co.

—In the southern part of Humboldt county, Cal., it is believed that there is sufficient oil to justify work on the wells on an extensive scale.

—Negotiations are pending at Vancouver, B. C., for the purchase of all the salmon canning industries in that vicinity on behalf of an English syndicate.

—The Mexican Central Railway is at present receiving but 46 cents for its silver dollars, which is the lowest price received for Mexican dollars in the history of the company.

—Russians are arranging for a line of steamships between San Francisco and Vladivostock, the eastern terminus of the Transsiberian Railway. Fifteen days is the scheduled time.

—The Santa Barbara Oil and Mining Company's five wells produced 128 barrels of oil the first week of their opening. The company has machinery to handle the output of 100 wells.

—Dodwell, Carlill & Co. of Hongkong, together with a number of Tacoma capitalists, have organized a steamship company and will compete for Alaskan trade, with headquarters at Tacoma.

—Regardless of the attitude of the Greater Republic of Central America, it is the intention of the Administration to recommend Government Control of the Nicaragua canal when Congress assembles next December.

—Moran Brothers of Seattle, Wash., building the torpedo boat Rowan, had made good progress until the Alaskan craze set in. So many of their workmen have dropped their work to go to Klondyke that they appeal to the Navy department for an extension of time in which to complete the boat.

—Two new wells are now being excavated at Coalinga, Fresno county, Cal. The production of the wells is now about 175 barrels a day and the shipping is over a carload a day. The oil goes to San Francisco, Oakland and Portland. The gas used in Fresno is manufactured from the Coalinga oil.

—During the past fiscal year there has been a reduction of mortgages throughout California. In Yolo county $338,275 worth of mortgages were cleared from the books of the county. San Bernardino county swept off mortgages to the amount of $450,000, Riverside county to the value of $600,000. Other counties make similar favorable reports.

—F. M. Smith is credited with present intention to build a new borax refinery in or near New York to supply refined borax for the Eastern market. The Alameda, Cal., factory, said to be the largest in the world of its kind, has raised its monthly output from about 600 to 700 tons. The demand has been increasing during the last several months, and it is now up to 800 tons monthly.

—Because of a call for animals suitable for use in Alaska pack trains, horses which were selling in Washington for $3 to $6 are now bringing $10 to $40. Horses are being shipped by every steamer. The Willamette carried 300 pack animals north. By August 15th, it is calculated, 800 horses will have arrived at Dyea and Skagaway for use in packing Klondyke outfits over the Chilkoot and Whites passes.

—The Chicago, Burlington & Quincy Railroad is going to extend its line across Colorado to Utah and to the coast. The extension will begin at Lyons, the terminus of the Colorado branch of the road, and run through Left Hand canyon, in Boulder county, to Ward; thence across the range to Routt county, tapping the Hahn's peak region, and across Colorado to Utah, passing to Ogden and Salt Lake.

—The following shows the taxable valuation of all the railroads operating in California, as fixed this week by the State Board of Equalization:

California & Pacific	$ 2,000,000
Central Pacific	13,000,000
Northern California	275,000
Northern Railway	3,100,000
South Pacific Coast	1,105,840
Southern California Motor	80,000
San Francisco & North Pacific	1,935,000
Southern California	2,950,000
Southern Pacific Company	14,664,580
California & Nevada	92,000
Carson & Colorado	230,000
Nevada, California & Oregon	110,000
Nevada County Narrow Gauge	100,000
North Pacific Coast	650,000
Pacific Coast	304,400
Pajaro Valley	150,000
San Francisco & San Mateo Electric	75,000
Gualala River	40,000
Sierra Valley	53,725
Pullman Palace Car Company	90,000
Pullman Palace Car Company (over A & P. Railway)	31,140
Atlantic & Pacific	1,450,000
Alameda & San Joaquin	143,520
San Francisco & San Joaquin Valley	876,540
Total assessments	$43,486,445

—Secretary of Agriculture Wilson has a report from a firm at Lisburn, Ireland, on some retting and scutching experiments conducted by them in Ireland with a ton of flax straw grown in the Puget sound region of Washington under the direction of the Agricultural Department in its experiments in 1895. These experiments developed the fact that for flax culture the Puget sound region is the equal in climate of some of the best flax producing regions of Europe. Attention is called to the low rate of seeding—one-half to two bushels per acre—and to the fact that fourteen bushels of seed per acre was produced. It is asserted that the experiment proves that farmers in this country can grow seed and fiber in the same plant.

—Of the bids for dredging a channel between Mare Island and Vallejo, Cal., that of the San Francisco Bridge Company is the lowest. It will be the largest single contract for dredging ever let by the Government on this coast, requiring the removal of 1,500,000 cubic yards of material. The channel to be deepened is 7000 feet long and will be worked to a depth of 30 feet at mean low water, and its width of 600 feet will make it ample for the passage of the deepest war vessel to reach the navy yard. The bridge company's bid was 10.74 cents per cubic yard. The cost of the work is estimated at $170,000.

—Nothing can be done more than has already been done toward marking the boundary line between Alaska and the British possessions along the 141st meridian until the Senate has passed upon the boundary treaty now before it. There is, however, no doubt of the location of the line along this meridian, as the people in the locality know where it is. The work of demarcation will be superintended by General Duffield, in charge of the Geodetic Survey, on behalf of the United States. He expresses the opinion that a railroad can easily be constructed from Taku inlet to the Klondyke gold fields, and believes the enterprise is well worth the undertaking.

Personal.

E. B. PRESTON of the State Mining Bureau is in Shasta Co., Cal.

W. E. LESTER has been elected president of the Mariposa Estate Co.

U. S. SENATOR SHOUP of Idaho says he will go to the Klondyke next spring.

J. J. CRAWFORD, ex-State Mineralogist, is examining his El Dorado county property.

A. H. RICKETTS has returned from Lakeport, Cal., where he had been arguing a mining case.

C. B. SESSIONS of the San Francisco Electrical Engineering Co. has returned from the Comstock.

MR. GRIFFITH of Donald has been appointed Gold Commissioner for the northern portion of East Kootenay, B. C.

HENRY BRATNOBER writes that he expects to get to Dawson City about as soon as the travelers by the Excelsior.

WALDEMAR LINDGREN of the U. S. Geological Survey will prosecute research in Owyhee Co., Idaho, this season.

S. M. ASHENFELTER has been appointed managing director of the Pike's Peak, Colo., Tunnel Construction Co.

CAPT. RAY, U. S. A., started on the steamer Cleveland on the 3rd inst., to investigate the Alaskan situation and report.

H. S. BLASDEL, the first State Governor of Nevada, has returned to San Francisco from his mines near Coulterville, Cal.

S. H. BABCOCK has been appointed traffic manager Rio Grande Western Ry., with headquarters at Salt Lake City, Utah.

SAMUEL NEWHOUSE, managing director of the U. S. Exploration Company of London, is examining mines in southern Utah.

FRED HOWE BOSTWICK, representing the Hendrie & Bolthoff Manufacturing Co. of Denver, Colo., has returned to that city.

O. O. HOWARD, JR., of Graniteville, Nevada Co., Cal., has negotiated to bond the Berry claims in the Klondyke for $2,000,000, should they prove satisfactory.

E. E. Leake, State Commissioner of Public Works, says, regarding the Newtown Shoals borings by Engineers Nourse and Randall, that he will urge the immediate purchase of the dredger for which the last Legislature appropriated $300,000.

JULIO PEREZ CANTON, commissioner from Chile to the Guatemalan Exposition, has this week been visiting various industrial establishments in San Francisco.

H. C. BEHR of the General Electric Co. is superintending the building of the $15,000 electric plant at the Hidden Treasure mine, Sunny South, Placer Co., Cal.

J. H. CURTISS of New York City is the first man who has gone to the Klondyke to start a commercial bank. Jos. Harvey of this city has gone there to start a faro bank.

PRINCE PONIATOWSKI, returned from Liverpool, says American investments are now more favorably looked upon in England than heretofore, including California mining investments.

DUNCAN MCVICHIE, until recently superintendent of the Iron Belt mine, on the Gogebic range, Wisconsin, succeeds George Kingsbury as superintendent of the Golden Gate mine, Mercur, Utah.

PROF. N. S. SHALER of Harvard University, a recognized authority on geology, is examining some mineral formations in Montana near the Canada line. He is accompanied by J. H. Talbott, ex-Mining Inspector of Colorado.

O. F. FERNBACK of New York city is a passenger on the outgoing steamer for Tokio, Japan. He has been engaged by the Japanese Government to superintend the erection and the operation of a trolley system of electric cars in the capital and throughout its suburbs. He has a three years' contract with the Japanese Government to superintend the introduction of the trolley system in the principal cities.

Commercial Paragraphs.

WHITE, ROGERS & CO., 306 Pine street, San Francisco, have been appointed Pacific coast agents for the Wilfley concentrating table.

THE Risdon Iron Works, Howard and Beale streets, San Francisco, last week sent to the Banner mine, Butte county, one 11-ton 250 H. P. engine.

DURING last week the Colorado Iron Works Co., Denver, Colo., shipped to the Britannia Mining Co., Ainsworth, B. C., one set of 14x27 inch crushing rolls; to British Columbia, machinery of ten-stamp mill, including vanners, crusher, etc.

THE E. P. ALLIS CO. are the Pacific coast agents for the Leyner drill. One can be seen in operation at the San Francisco office, 9 Fremont street.

Recently Declared Mining Dividends.

Morning Star Mining Co., Placer Co., Cal., dividend No. 80, $8 per share; payable immediately.

Kearsarge Copper Mining Co., Michigan, $1 per share; payable Aug. 2nd.

Quincy Copper Mining Co., Michigan, $4 per share; payable Aug. 16th.

Gwin mine, Cal., 30 cents per share, $6000; payable immediately.

Pennsylvania Mining Co., Cal., 5 cents per share; payable immediately.

Boston & Montana Copper Mining Co., Montana, $3 per share, $450,000; payable Aug. 12th.

Recent California Mining Incorporations.

Klondyke Co-op. G. M. Co., Fresno; W. H. McKenzie, B. F. Sheplar, F. J. Haber; capital stock, $48,000; subscribed $600.

Franco-American M. Co., Los Angeles; F. Colas, A. L. Appel, E. E. LeFevre, W. F. Botsford, A. B. Dessery; capital stock, $100,000; subscribed $68,782.

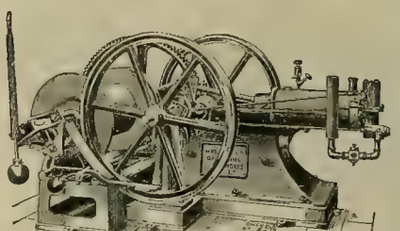
White Peak Group M. Co., Los Angeles; J. W. Wenzel, M. L. Wicks, R. H. Bradley, C. McComas; capital stock, $1,000,000; subscribed $500.

Crystal Hill Mining Co., Oakland, Cal. J. M. Davis, A. and F. Roberts, I. S. Watson, B. C. Fabrique; capital stock, $150,000; subscribed, $50.

Southern Alaska Mining and Development Company, San Francisco. H. T. Renton, C. Greene, R. B. Fripp, F. T. Gerst, C. Olaine; capital stock, $50,000; $7000 subscribed.

Pinas Altos G. M. Co., San Francisco; J. C., F. and R. A. Clark, A. H. Winn, E. J. McCutchen, H. A. Whitley, A. M. Jordan; capital stock, $1,000,000; subscribed stock, $700.

Hercules Hoisting Engines



Solve the difficulty of fuel, and make mining profitable where steam power is too expensive. Over 3000 Hercules Gas and Gasoline Engines are in use, giving entire satisfaction. Fully guaranteed. Requires no engineer. No smoke, no dirt. No danger.

We build engines from 2 to 200 h. p. for pumping, hoisting, running air compressors, sinking shafts and for all power purposes. Used in mines throughout the coast.

Send for Catalog to HERCULES GAS ENGINE WORKS, 217 BAY ST. San Francisco, Cal.

California's 44th Annual State Fair

WILL BE HELD AT SACRAMENTO, . . .

TWO WEEKS. September 6th to 18th, 1897.

THIS ANNUAL EXHIBITION will embrace a complete representation of the Agricultural, Mechanical and Industrial possibilities of the State.
MECHANICAL DEVICES can be here shown to a better advantage, and, if meritorious, receive recognition of value in placing them on the market.
THE EXHIBIT OF PRODUCTS from lands offered for sale, gives both sellers and buyers an acceptable opportunity to meet.
THE LIVE STOCK DEPARTMENT is eagerly sought each season by buyers desiring to replenish their herds with stock of new blood lines. This is necessary and insures sales to all exhibitors.
THE POULTRY EXHIBIT will constitute a most important division of this year's exhibition, and will offer a most excellent chance for buyers to view the various breeds of fowls in comparison.
THE DAIRY DEPARTMENT will have a complete working exhibit showing the latest methods in dairying, and the working of improved appliances. Competent instructors from some of the leading creameries in the State will be in charge to give instructions to all in this growing industry.
ELECTRIC POWER, space and light will be furnished free to exhibitors.
GRAND MUSICAL CONCERTS will be held each evening at the Pavilion by the **California Exposition Band.**
THE RACING PROGRAMME will form one of the leading features of amusement, and usually attracts a large attendance that are of benefit to all exhibitors.
TO MANUFACTURERS AND DEALERS we say exhibit your goods and wares, meet the public on neutral ground and profit by advertising in a practical way. The public attends these exhibitions in vast numbers to be instructed as well as amused.
FREE TRANSPORTATION for exhibits and excursion rates will be given by the Southern Pacific Company on all their lines.
Address the Secretary for special information. Send for Premium Lists.

EDWIN F. SMITH, Secretary. C. M. CHASE, President.

MINERS, ATTENTION!

We beg to call attention to our "RISDON HAMMERED" Shoes and Dies, which are made of a special quality of steel, are hammered and then compressed in moulds so as to give the greatest possible density.

These Shoes will outlast any other make and will not chip or cup.

We have attached a sketch showing sizes; fill in the size of your Shoes and Dies, and order a trial set.

Our prices are as low as any, and the article we offer should commend it to all mine owners and mill men.

The Mine and Smelter Supply Co., Denver, Colo.

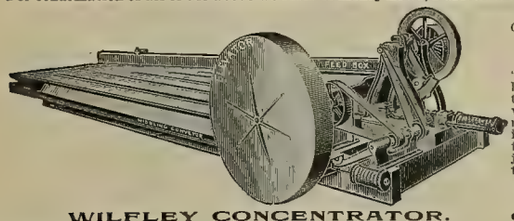
THE LARGEST STOCK OF MINING, MILLING AND SMELTING MACHINERY WEST OF CHICAGO.

PIPE, PACKING, RUBBER BELTING, AND SUPPLIES OF ALL KINDS.

SOLE AGENTS FOR WILFLEY CONCENTRATING TABLE,

And claim for it BETTER work than any Concentrator made, with a capacity of from 15 to 25 tons per day of 24 hours. It is simplicity itself. No moving belts or intricate parts. Any one can learn to operate in an hour.

For confirmation of all of the above we refer to Henry Lowe, Puzzle Mine, Breckenridge, Col.; Mary Murphy Mine, St. Elmo, Col.; W. E. Renshaw, Mayflower Mill, Idaho Springs, Col.; H. E. Woods, Denver, Col.



WILFLEY CONCENTRATOR.

Office of— Milwaukee Mining Co., Standard Mining Co., Cœur d'Alene Mining and Concentrating Co., Galena Mining Co., Hecla Mining Co Phœnix Mining Co. Lead-Silver Mines located in the Cœur d'Alene Mining District, Northern Idaho.

FINCH & CAMPBELL, GENERAL MANAGERS. WALLACE, IDAHO, June 18, 1897.

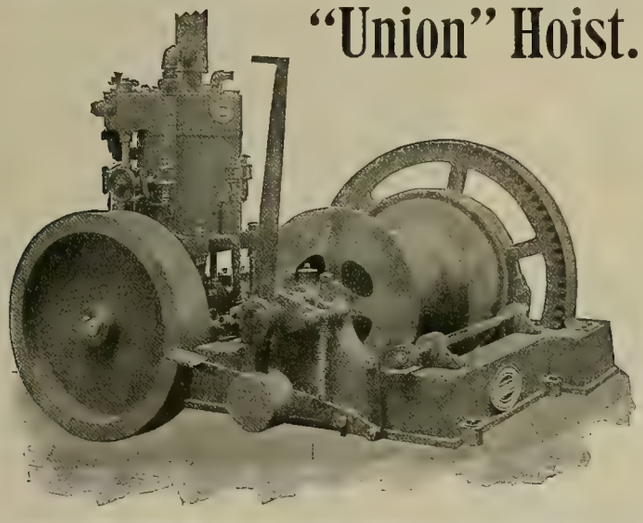
The Mine and Smelter Supply Co., Denver, Colo.—GENTLEMEN: Replying to your favor of the 8th inst., regarding my experience with the "Wilfley Concentrating Table," will state that in February last I placed in the vanner room of the Standard mill one of your tables, which has been in constant use every day since. It has been operated by the usual attendant of the vanners and has been given no special attention, and has been supplied with the same "feed" as the Frue vanners and at the end of each day's run has shown lower tailings than the vanners and produced from three to four times the quantity of concentrates of the same value per ton as any of the Frues. We have three more of the Wilfleys in the same mill, which are all doing splendid work and handling fully twenty tons each per day of silicious ore carrying about 10 per cent lead and 12 ounces silver. They are all making a remarkably close saving of values and giving the most perfect satisfaction. A very fair opportunity is offered in this mill for comparing the work of different concentrators, as we are using Harz jigs, Collom jigs, round buddles, Frue vanners, and Wilfley tables, and handling nearly 500 tons of crude ore per day, and all of the machines are given the class of work for which they are best adapted. I can heartily recommend the Wilfley to any one needing a concentrator for fine ores.

Yours very truly, EMERSON GEE, Manager Standard Mining Co.

These Tables have displaced belt tables of almost every make, as is shown by letters in our possession.

PRICE, $450.00.

"Union" Hoist.



The above cut represents our 10 h. p. Double Cylinder Engine of latest type, and Hoist combined on strong iron base. This hoist is designed to raise one ton 125 feet per minute from an inclined shaft, or 1500 pounds at the same speed vertical lift. The drum will hold over 600 feet of ⅝-inch cable. The outfit weighs 3500 pounds.

THE UNION GAS ENGINE CO.

—BUILD THE—

"Union" Gas Engines,

Which use either Manufactured or Natural Gas, Ordinary Stove Gasoline (Naphtha or Benzine), Distillate or Kerosene.

STATIONARY ENGINES for All Kinds of Work, Built in Sizes from 3 to 200 h. p.
"UNION" COMBINED HOISTS in Sizes from 2 to 40 h. p.
"UNION" COMBINED COMPRESSORS—20, 30, 40 h. p.
HOISTS and COMPRESSORS Can Be Built in Larger Sizes to Order.
"UNION" MARINE ENGINES, 4 to 200 h. p., of Single, Double and Four-Cylinder Types.
TEN YEARS' EXPERIENCE Building Gas and Oil Engines.
"UNION" ENGINES Are In Use All Over the United States.
"UNION" ENGINES Are Simple, Durable and Economical.

If you do not find what you want in it, send for catalogue and price list of **Standard Mining Works and Scientific Publications.**

MINING AND SCIENTIFIC PRESS,

330 Market Street.....**San Francisco, Cal.**

Assaying.—Part I—Gold and Silver Ores.
Third edition; Just Out. Rewritten and Improved by the Author, C. H. Aaron. Embraces 130 12-mo pages, with illustrations; well bound in cloth; 1896. Price, postpaid.....$1 00

Assaying.—Parts II & III—Gold and Silver Bullion, Lead, Copper, Tin, Etc.
Latest edition. Contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter. Price, postpaid.....$1 75

Notes on Assaying and Assay Schemes.
By P. De Peyster Ricketts, E. M., Ph. D., Professor in Assaying in the School of Mines, Columbia College, N. Y. Prepared with special reference to the wants of the student and practical assayer. Containing also Rules for the Examination of Mines, Assayer's Outfit, Treatment of Ores, etc. Fifteenth edition. 8vo., cloth.....$3 00

Prospector's Field Book and Guide.
By H. S. Osborn.....$1 50

A Practical Guide for Prospectors and Miners.
By C. W. Moore. With numerous illustrations.....$4 75

Roasting of Gold and Silver Ores and the Extraction of their Respective Metals Without Quicksilver.
Second edition. By Guido Kustel, M. E. Contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. Price, postpaid.....$3 00

The Lixiviation of Silver Ores with Hyposulphite Solutions.
With special reference to the Russell Process. Second edition. Completely revised. By Carl A. Stetefeldt. Price, bound in cloth.....$5 00

Modern Copper Smelting.
By Edward Dyer Peters, Jr. Seventh edition. Rewritten and enlarged. Profusely illustrated....$5 00

Electricity in Mining.
By Sylvanus P. Thompson.....50 cts.

Practical Treatise on Hydraulic Mining.
By Aug. J. Bowie, Jr. On the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on heavy grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc Price, postpaid.....$5 00

Practical Hydraulics.
A book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers and Irrigators. By P. M. Randall. Contains useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulæ, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules and tables are prepared. Is specially applicable to the Pacific Coast. Price, postpaid, $2

The Metallurgy of Silver.
By M. Eissler. Profusely illustrated.....$4 00

The Explorer's and Assayers' Companion.
A third edition of selected portions of the "Explorer's, Miner's and Metallurgist's Companion." By J. S. Phillips, M. E. A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying and Metallurgy. Price, postpaid.....$6 00

Aaron's Leaching Gold and Silver Ores.
By C. H. Aaron. The most complete handbook on the subject extant; 164 pages, octavo. Illustrated by twelve lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, postpaid.....$3 00

Manual of Assaying—Gold, Silver, Copper and Lead Ores.
By Walter Lee Brown, B. Sc. One colored plate; 132 illustrations on wood. Fifth edition. 12 mo. 533 pp. Price, postpaid.....$2 50

The Metallurgy of Gold.
By M. Eissler. Profusely illustrated.....$5 00

A Text Book of Mineralogy.
Based upon the System of Mineralogy of Prof. J. D. Dana. Embracing an extended Treatise on Crystallography and Physical Mineralogy. By Edw. S. Dana, Curator of Mineralogy, Yale College. With upward of 800 woodcuts and one colored plate. Seventeenth edition. 8vo., cloth.....$3 50

Notes on the Treatment of Gold Ores.
By Florence O'Driscoll, Associate Member of Institute of Civil Engineers. 8vo., cloth.....$2 00

A Practical Manual of Minerals, Mines and Mining.
By H. S. Osborn.....$4 50

Cyanide Processes for Gold and Silver Ores.
By E. B. Wilson, E. M. 12mo., cloth.....$1 50

Practical Metallurgy and Assaying.
By A. H. Hiorns.....$1 50

The Practical Metal Worker's Assistant.
By Oliver Byrne. Illustrated.....$5 00

Quartz Operator's Handbook.
By P. M. Randall.....$2 00

Assayer's Guide.
By Oscar M. Lieber.....$1 50

Assayer's Manual.
By Bruno Kerl. Illustrated.....$3 00

Metallurgy of Silver, Gold and Mercury in the United States.
Showing the latest practice pursued in American Metallurgical Establishments. With 186 engravings and folding plates, tables, etc. By Prof. Thos. Egleston, School of Mines, Columbia College. With corrections. Vol. I.—SILVER. 8vo.....$7 00

Metallurgy of Silver, Gold and Mercury—Continued.
Vol. II.—GOLD, MERCURY, Etc. Illustrated with 140 engravings and folding plates; 935 pages, 8vo., cloth.....$7 50

Manual of Determinative Mineralogy.
With an Introduction on Blow-Pipe Analysis (constituting the Determinative Part of Dana's Mineralogy). By Prof. Geo. J. Brush. Thirteenth edition, translated into the new system. 8vo., cloth...$3 50

Skeleton Mining Report.
Of great practical value to miners and mine owners in making a comprehensive report on mining properties. Useful and convenient to mining engineers as a field notebook. Price, postpaid....50 cts.

Stamp Milling of Gold Ores.
By T. A. Rickards, M. E. An actual record of milling practice in this and other countries. Deals with the erection and management of mills, and contains many helpful suggestions to those interested in the extraction of gold from its ores. Well illustrated. Cloth. Price, postpaid.....$2 50

Assaying Gold .....AND..... Silver Ores.

By C. H. AARON.

A Standard Work.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the pratical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores,") that have been "successfully popular," is written in a condensed form, which renders his information more readily available than that of more wordy writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:—Perface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assay; Examples of cupellation; Weighing of Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests of Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 126 12-mo pages, with illustrations, well bound in cloth; 1896. Price **$1.00** postpaid. Sold by the **Mining and Scientific Press,** 330 Market St., San Francisco.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

SIDEWALK HATCHWAYS AND DOOR MECHANISM.—Peter H. Jackson, San Francisco, Cal. No. 587,210. Dated July 27, 1897. This invention relates to certain improvements in horizontally placed door frames and the doors which are adapted to close the openings of said frames and which are employed for the purpose of obtaining access through the sidewalks and other places where it is desired to have a door or pair of doors which shall be waterproof against leakage when the door is closed and at the same time to render such doors easily operated and controlled from the basement or chamber beneath them. It consists in the combination with the teams upon which the arches of the basement and the sidewalk are supported of a Z-shaped bar, an angled or channeled bar supported upon the beam and flanges adapted to overlap and be riveted or bolted together. In conjunction with this is an angular lever secured to the door, bent downward and then horizontal so as to lie approximately parallel with the seam beneath the sidewalk when the door is closed, said lever serving when pulled down to open the door. Around the periphery of the door opening, channels are formed adapted to receive any water which may leak in around the edges and passages through which it may be carried away to some point of permanent discharge.

BUSHING AND FAUCET FOR BARRELS.—Mason S. Norton, San Francisco, Cal., assignor to the American Faucet Co., same place. No. 587,157. Dated July 27, 1897. This invention relates to improvements in bushings for barrels, casks and like devices. It consists essentially of a longitudinally moving double-acting valve operated by a faucet or key to open and close upon turning the faucet axially, and to remain locked when the faucet is removed. The bushing which is permanently fitted into the cask has a closed inner end made smooth and continuous with a central opening which has an inwardly facing seat. Opposite to this seat and removed to a distance therefrom within the bushing is a second seat facing the first one, also having a central opening through it. A rotatable valve is movable between these two seats having faces upon it which serve to alternately close one or the other of the openings. The periphery of the valve is screw-threaded and the valve has an inner engaging head and socket connection between itself and the turnable key or faucet so that the valve may be engaged and turned from the exterior of the cask to close upon one or the other of the seats. The interior of the seat is the one against which the valve closes to prevent the escape of liquid and from which it is removed when it is desired to allow the liquid to flow. When the valve is closed against the other seat it forms a smooth continuous surface with the inner end of the bushing and the cask can then be pitched without the pitch getting into or interfering with the interior mechanism of the cap or faucet. In conjunction with this valve are a series of devices for forming tight joints and preventing any escape of liquid when the valve is being either opened or closed.

EYEGLASS HOLDER AND CORD ATTACHMENT.—Watson D. Fennimore, San Francisco, Cal., assignor to the California Optical Co., same place. No. 587,192. Dated July 27, 1897. This invention relates to a cord attachment wich is especially designed for use with eyeglasses and for similar purposes. It consists of holders formed of single pieces of wire bent and having tapering spiral coils formed within some portion of the length, these coils forming conical chambers through which the cord is passed and where knots formed in the end of the cord will be held within the larger ends of these chambers. To one of these devices a pin or other attaching device is secured by which it may be attached to the clothing of the user, and the other carries a clasp which enables it to be conveniently attached to the eyeglass.

British Columbia.

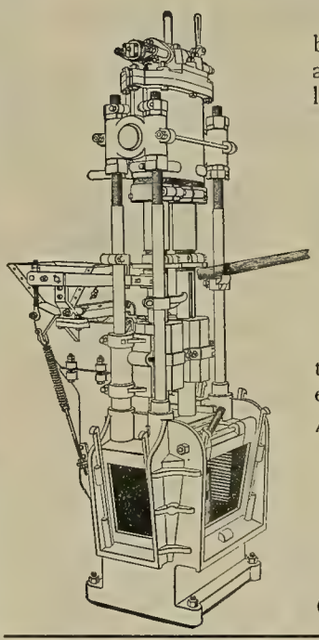
We furnish Machinery and build **Stamp Mills, Hoisting and Pumping Works** operated by **Steam, Water or Electric Motors;** also complete **Concentrating and Smelting Plants** for the reduction of **Galena, Silver and Lead Ores,** and the recovery of **Copper and Silver;** Improved Air Compressors, Wire Rope Tramways, Etc., Etc.

A STEAM ORE STAMP.



One of the BONANZA MINES of the Black Hills was developed by a **TREMAIN STEAM STAMP MILL,** installed last summer at a cost of about $1600. After six months' run the superintendent wrote the following letter:

HILL CITY, S. D., Feb. 2, 1897.

Gates Iron Works, 650 Elston Ave., Chicago, Ill.—GENTLEMEN: It gives me great pleasure in informing you of our success with the Tremain Steam Stamp Mill which we have been running since last July. We have been running on hard, white quartz, some of it of a flinty character and a small portion of it slightly decomposed. We average about ten tons every 24 hours through a forty-mesh screen. If our financial standing had been a little better, so we could have put in a small engine and rock crusher, I am confident we could put through 14 to 15 tons in 24 hours. The wear and tear is considerably less than an ordinary stamp mill, it all being on the shoes and dies. The last we used of these were of the aluminum steel, which are the best wearing shoes and dies I have ever seen. The parts are all well made and durable, I having failed to see any weak point about the machinery.

We use one cord of pine wood in 24 hours, and run the mill with 70 to 80 lbs. of steam.

I have followed mining in connection with milling for thirty years and have never seen its equal for convenience, durability and cheapness. To parties wishing to purchase a quartz mill I cheerfully recommend the Tremain Steam Stamp Mill for its small cost, economy in operation and complete results of working. Very truly yours, [SIGNED] JAMES C. McDONALD, Supt. St. Elmo M. & M. Co.

This Mill has the capacity of a 5-stamp gravity mill and costs less than half to install. Automatic feeder of approved design. Weight of entire Mill 3300 lbs. Made sectional for mule-back transportation.

IMPROVED PORTABLE HOISTING ENGINES.

Improved Self-Contained Three or Five Stamp Mill,

Saves bill for heavy timbers, millwright and mechanics' labor, and a large amount of space. The term self-contained means a great deal for the mine owner, and can be readily recognized and appreciated in making an estimate for an ordinary plant when the comparative cost is considered.

FIRST: There is saved a large bill for heavy timbers, in many instances obtained at great expense and loss of time.

SECOND: The saving in millwright and mechanics labor in framing and erecting.

THIRD: The large amount of space saved.

FOURTH: The great saving of freight,

330 MARKET ST., - SAN FRANCISCO, CAL.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us to give advice which will give inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address DEWEY, STRONG & CO., Patent Agents, 330 Market St., San Francisco, Cal.

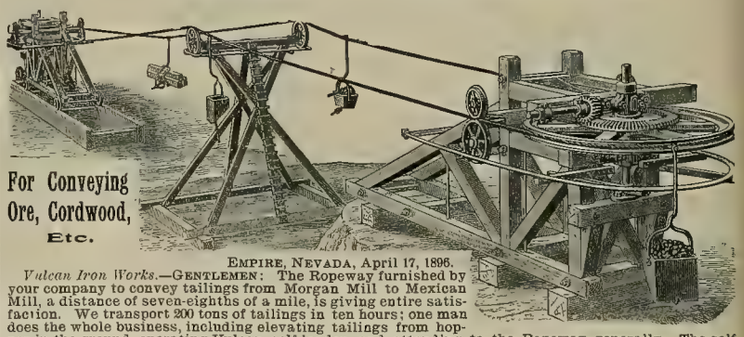
VULCAN ROPEWAY

—WITH—

AUTOMATIC ORE LOADER AND AUTOMATIC DUMPING DEVICE.



For Conveying Ore, Cordwood, Etc.

EMPIRE, NEVADA, April 17, 1896.

Vulcan Iron Works.—GENTLEMEN: The Ropeway furnished by your company to convey tailings from Morgan Mill to Mexican Mill, a distance of seven-eighths of a mile, is giving entire satisfaction. We transport 200 tons of tailings in ten hours; one man does the whole business, including elevating tailings from hopper in the ground, operating Vulcan self-loader, and attending to the Ropeway generally. The self dumper requires no attention whatever. The Vulcan loader I consider the best feature in the whole Ropeway, making it possible for one man to load 200 tons in ten hours.

Yours very truly, J. P. WOODBURY, Supt.

Market Reports.

The Markets.

SAN FRANCISCO, Aug. 5, 1897.

The buying of supplies for Alaska continued throughout the past week. Every vessel that left here for Alaskan ports has had large shipments of goods suitable for the miners in the new El Dorado. Several lines of provisions and heavy woolen goods have been cleaned up, so large and unexpected has been the call. This has necessitated urgent shipments from the East to this city of the goods most in demand. Iron workers report fair to good business. Some have orders in hand that will run them for some time to come, while the others are kept busy on work which the larger institutions are not able to handle. Very few changes have been made in prices of goods most affected by the tariff, and none are expected until stocks in jobbers' hands are greatly reduced.

The local money market is working easy. The higher prices ruling for nearly everything raised on the farm, have created a feeling of confidence to which the trade has been a stranger for several years. This feeling is made stronger by the boom in gold mining. It has been many years since this coast has witnessed such a mining craze as is that seen in the rush to Alaska. This craze is beginning to attract more attention to gold mining properties in this State, for there seems to be more inquiry from moneyed men at the East. The mint opened this week. Several million dollars worth of gold bullion was waiting deposit, considerable of which came from the Klondyke. This money will soon be available for putting into circulation. New York advices are to the effect that the money market is showing signs of firming up. This is due to the increased demand for crop-moving purposes and a better demand for speculative purposes. With exceptional heavy shipments of grain to Europe, which will be supplemented soon by cotton shipments, it is not at all likely that the rates of interest will go much if any higher than two cents for call loans.

New York Silver Prices.

NEW YORK, August 5.—Following are the closing prices for the week:

	Silver in— London.	N. Y.
Friday	26⅞	58⅜
Saturday	26⅝	57⅞
Monday	26⅝	57⅞
Tuesday	26¼	57¾
Wednesday	26¼	57
Thursday	25¾	55½

The local bullion, money and exchange quotations current are as follows:

Commercial Loans, % per annum	6
Commercial Loans, prime	5
Call Loans, gilt edged	4@4½
Call Loans, mixed securities	5@6
Mortgages, prime, taxes paid by lender	6@8
New York Sight Draft	12½c Prem
New York Telegraphic Transfer	15c Prem
London Bankers' 60 days	$4.87
London Merchants	$4.85
London Sight Bankers	$4.88
Refined Silver, per oz., 1000 fine	55½
Mexican Dollars	46½

SILVER.—The market has been breaking badly since last Friday. The decline during the week has been 3⅜ cents per ounce. This is the most rapid since India closed its mints in March, 1894, to the white metal. At this writing it looks as if still lower prices will rule, for there does not seem to be any moneyed pool to sustain it, while there is no buying by Japan or Russia and very little by India, China or any other country. While there is not much if any buying, there seem to be quite free selling offers. *Bradstreet's*, just to hand, says: "In spite of the absence of any speculative features in the silver market, its course has attracted no little attention. The principal causes of the drop can be found in a combination of large offerings from this country, extremely limited Indian buying, together with the flatness of exchange on China, which latter circumstance is explained by the large interest payments China is now forced to make abroad and the decline in values of the principal Chinese exports."

MEXICAN DOLLARS.—The market is thoroughly demoralized, so much so that quotations are entirely nominal. There is some buying by Chinese, the low prices to which they have dropped being an incentive.

QUICKSILVER.—The market here is steady but New York reports firmer prices. Shipments by sea to Mexican ports aggregate the past week 170 flasks.

Our market is quoted at $40 for domestic consumption.

COPPER.—The market is firm with a good consumption reported. The East reports steady to strong markets, with a free export movement. The home demand is increasing at the East. James Lewis & Sons, Liverpool, report in their latest received circular as follows:

The following statistics show the apparent increase in the consumption of England, France and Germany to be at the rate of 22,997 tons per annum. The Board of Trade returns for the first six months give the following results: Imports into England, 1896, 65,057 tons fine, do 1897, 67,263 tons fine; exports from England, 1896, 35,344 tons fine, do 1897, 24,196 tons fine. Difference, 1896, 29,713 tons fine, do 1897, 43,067 tons fine. Difference in stocks Jan 1 to July 1, 1896, decrease 13,135 tons fine, do 1897, decrease, 3,560 tons fine. Apparent consumption in England (including sulphate of copper made and subsequently exported), 1896, 42,848 tons fine, do 1897, 46,627 tons fine. The following shows the consumption of France for the same months: Shipments from United States first six months 1896, 11,227 tons, do 1897, 12,801 tons; shipments from England first six months 1896, 3,060 tons; do 1897, 1,502 tons; imports from other countries first six months 1896, 5,517 tons, do 1897, 6,559 tons; total, 1896, 19,804 tons, do 1897, 20,862 tons. Difference in stocks, Jan. 1 to July 1, 1896, increase, 948 tons, do 1897, increase, 320 tons. The increased consumption of England and France is therefore 5465 tons. The official German returns for the first five months are: Imports, 1896, 23,447 tons, do 1897, 28,780 tons; exports, 1896, 3,673 tons, do 1897, 3,978 tons; consumption, 1896, 19,774 tons, do 1897, 24,802 tons. The consumption of Germany therefore shows an increase this year of 5,028 tons exclusive of the copper obtained from their own mines, and from pyrites imported—or at the rate of 12,067 tons per annum. To Italy, Austria and Russia 4,051 tons have been shipped from the United States, against 3,919 tons in the same six months of last year. Producer's returns are as follows, in tons:

	Jan.-June, 1896.	July-Dec. 1896.	Jan.-June, 1897.
European production	42,255	44,114	44,205
American production	101,380	103,714	108,652

Our market is quoted as follows:

Ingot casting, jobbing	13@—
Ingot " wholesale	12½@—
Sheet copper	—@16½
Bolt	¼ and 5-16, 20c; ⅜ and larger, 16½

TIN.—The market for both plate and pig is fairly steady. The East reports easier markets.

The market is quoted in jobbing lots as follows:

Pig, per lb., jobbing	—@ 15
Plate, I C coke, heavy, per box	$4 10@4 25
" " " light, "	4 00@—

LEAD.—Our market is firm at full figures. The East reports firm markets with a good demand ruling.

Our market is quoted in jobbing lots as follows per pound:

Pig	—	@	4 80
Bar	5 00	@	5 25
Sheet	—	@	6 25
Pipe	5 25	@	5 50

SHOT.—The market is steady to firm. Sales are increasing.

Our market is quoted as follows:

Drop, sizes smaller than B, per bag of 25 lbs	$1 35
Drop, B and larger sizes, " "	1 60
Buck, Balls and Chilled, do, " "	1 60

POWDER.—The market is steady.

The market is quoted as follows for Hercules: No. 1, from 11¾c to 17¼c, according to strength and quantity; No. 2, from 9c to 11c, according to strength and quantity.

IRON.—Our market is well supplied, with some cutting reported. The East reports weaker markets, owing to higher ocean freights, which are against exporting.

AMERICAN.	To Arrive.	Spot.
Sloss	$20 00	$22 00
Thomas	21 00	22 00
Salisbury	29 00	31 50
ENGLISH.		
Barrow	$21 00	$23 00
Gartsherrie	21 50	23 00

COAL,—There is nothing new to report. Until stocks on hand before tariff went into effect are exhausted our market will not feel the increase much.

We quote as follows:

SPOT FROM YARD—PER TON.	
Wellington	$8 00@— —
Greta	6 00@ 6 50
Nanaimo	6 50@ 7 00
Gilman	5 50@ 6 00
Seattle	5 50@ 6 00
Coos Bay	—@ 4 75
Cannel	8 00@— —
Egg, hard	12 00@13 00
Wallsend	6 50@— —
TO ARRIVE—CARGO LOTS.	
Australian	5 50
Liverpool Steam	6 25
Scotch Splint	— —
Cardiff	6 25
Lehigh Lump	9 00
Cumberland	13 00
Egg, hard	10 00
West Hartley	6 50

COKE.—The market is quoted as follows:

Gas Companies'	— —		— —
English, to load	9 50	@	— —
" spot, in bulk	10 00	@	— —
" in sacks	11 00	@	12 00
Cumberland	— —	@	— —

ANTIMONY.—The market is steady.

Our market is quoted at 8¼c in a jobbing way. New York mail advices quote 7¾c for Cookson's, 7¼c for Hallett's and 7c for Japanese.

NAILS.—The market is steady.

Wire, carloads, basis per keg	....		
" jobbing, " "	$2 15		
Cut, carloads, " "	....		
" jobbing, " "	2 05		

BORAX.—The market is steady.

The market is quoted as follows:

Refined, in carload lots, in barrels	5
Refined, in carload lots in sacks	4¾
Powdered, in car lots	5
Concentrated, "	4¼

PLATINUM.—The market is quiet.

Our market is quoted in a jobbing way at $15 per ounce and for scrap $10 an ounce.

ZINC.—The market is steady.

Our market is quoted at 10 to 15 cents, according to thickness.

ALUMINUM.—The market is steady.

We quote in jobbing lots at 45 to 50 cents per pound for ingots.

Chemicals.

Notwithstanding the new tariff increasing duty on several lines is in effect, still the market does not respond, and what is more, it is not expected to move up any until present stocks are exhausted. The East reports that importers have advanced prices slightly on every line affected by the tariff, but from second and third hands the goods can be had at the old prices, and as they carry liberal stocks, it looks as if it will be some time before jobbing prices are higher.

SULPHURIC ACID.—The demand is fair We quote in a jobbing way at 1½c per lb for 66%.

ACETIC ACID.—The market is steady at 6 to 12c per pound from store for carboys, according to make.

NITRIC ACID.—Our market is reported steady from store at 6½@7c per pound in carboys.

We quote in a jobbing way at 70 to 75 cents per pound.

SODA ASH, 58% (LeBlanc process).—The market is firm at $1.55 per 100 lbs. in a jobbing way.

CAUSTIC SODA, 60%.—The market is quiet at 3c per pound in a jobbing way.

HYPOSULPHATE OF SODA.—There is a fair demand at 2½c a pound from stores.

NITRATE OF SODA.—Market is steady.

Our market is quoted from store at 4c for 95%.

Mining Share Market.

SAN FRANCISCO, August 4, 1897.

Following an advance in Sierra Nevada to $1.75, Con. Virginia to $1.50, and other shares proportionately, the market began to ease until yesterday Sierra Nevada sold down to 90 cents and the others fell off from 20 to 30 per cent. The advance allowed several brokers to sell at good round profit their long shares and also allowed them to short. At the lower prices they have filled. So they made both ways. The reports of ore strike in Sierra Nevada and preparations made in that mine to stope ore caused the more credulous outsiders to buy at advancing prices and also frightened the more timid short sellers into filling. The rapid decline in the market looks as if another advance is in contemplation at an early day, but whether Sierra Nevada will be the leader it is hard to say at this writing, but it is safe to affirm that it will not be unless at the decline long buyers have been shaken out and short shares put out by persons who only become bears when the market has broken. The general situation on the Comstock is favorable, while the general condition of the country is favorable for a bull campaign. Money is in liberal supply and people are anxious to invest in anything which affords opportunities of making quick turns and getting higher prices. All kinds of farm produce are very strong at higher prices, the transportation companies throughout the country are very busy and have to add more rolling stock, while speculation at New York is booming in railroad and industrial securities. The above, combined with a boom in gold mining, are creating and causing a strong speculative feeling everywhere. Although the mining share market has not felt the influences to any marked degree, yet a careful comparison shows that the average of prices is higher, which indicates a slow but steady improvement in values. Whether this, as it has always done before, will lead up to a good-sized or a small-sized deal, is beyond our ken, but it looks well for the former, although we are told different by those who ought to know. The market value for Standard appreciated the past week—moving up to $1.70 to $1.75, at which figures it has held firm. There is good work going on in the mine.

The official letters from the Comstock mines are not calculated to enthuse persons, but rather to dampen the ardor of the more sanguine, who are always having visions of big ore deposits and are under continuous fear of being left. While the better class of experienced miners that have worked in the mine contend that good-sized ore bodies can be shown up when desired, yet they think before this is done there must be a complete change in manipulation of shares, and lawsuits, blackmailing or otherwise, must be quieted. So long as there are fears of suits, just so long will moneyed men not go in for bull markets, and without big moneyed backing good-sized deals can not be promoted. From the letters on file and reliable sources we compile the following: In Utah the north drift is being driven ahead about 3 feet a day. At last advices it was in porphyry, showing clay seams. Work in the east crossdrift 175-foot level of Andes has been resumed. It is in quartz and porphyry. In Sierra Nevada they are cutting out and putting in square sets of timber, to raise or sink, as deemed best, on the ore found on the Layton tunnel level. If the market is in a condition for a bull move, it is quite certain that more ore will be found, but if not in condition, it is liable to get smaller. In No. 3 west crossdrift 900-foot level they were at last advices in good ore. In Union they are still working on the 900-foot level. In Mexican they have finished stripping the south drift on the 1000-foot level. In Ophir they are still running a west crossdrift on the 1000-foot level and extending the north drift on the Central tunnel level. Work is continued in Con. Virginia on the 1000-foot, 1550-foot and 1650-foot levels, without any change of interest to report. An assessment was levied the past week, but the large amount of work that is being done calls for heavy disbursements. From Best & Belcher and Gould & Curry nothing new regarding work or formation of material run through has come to hand. The same remarks apply to Savage. No work is reported in either Chollar or Hale & Norcross. In Potosi new work is reported. Fair progress is being made in the old workings. It is singular nothing comes from Bullion. Some say important work is being done which will be reported when shares are better concentrated. In Alpha they are ready to commence stoping ore. It is not likely that the high-grade ore will be extracted, or, if it is done, the impression prevails that the public will not know it. Nothing new comes to hand from the joint work of Con. Imperial, Challenge and Confidence; neither is there anything new reported from Confidence, Yellow Jacket, Crown Point, or the joint work of the two latter and Kentuck. Work has been resumed in Belcher and Seg. Belcher.

Attention is attracted from the Brunswick lode to the Comstock, yet mining men are still watching the joint work by Con. Virginia, Best & Belcher and Gould & Curry. They are running an east crossdrift on the northern boundary, and also a south drift, both on the 600-foot level. They are crossdrifting east on the 300-foot level. In Chollar work is confined to sinking shaft No. 1, which is down on an incline over 1000 feet, extracting ore on the 300-foot and 400-foot levels,

WILL NEGOTIATE with owners or their duly authorized agents only.

WILL INVESTIGATE only thoroughly bona-fide properties, either Mines, Prospects or Mineral Lands, whose owners are willing to make reasonable terms. When sending reports on properties also send terms on which you are willing to sell or lease.

Assessment Notices.

ROSE CREEK MINING COMPANY. Location of principal place of business, San Francisco, California; location of works, Star, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 28th day of June, 1897, an assessment (No. 1) of 15 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room 163, Crocker building, junction Post, Montgomery and Market streets, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 21st day of August, 1897, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 14th day of September, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. M. WILMANS, Secretary.

Office—Room 163, Crocker building, San Francisco, California.

BEST & BELCHER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia District, Storey County, Nevada.

Notice is hereby given that at a meeting of the Board of Directors, held on the 1st day of July, 1897, an assessment (No. 62) of 25 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, room 33, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 5th day of August, 1897, will be delinquent, and advertised for sale at public auction; and, unless payment is made before, will be sold on THURSDAY, the 26th day of August, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

M. JAFFE, Secretary.

Office—Room 33, Nevada block, 309 Montgomery street, San Francisco, California.

MARGUERITE GOLD MINING AND MILLING Company.—Location of principal place of business, San Francisco, California; location of works, Auburn, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 28th day of July, 1897, an assessment (No. 7), of 10 cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the Secretary, at the office of the company, 237 12th street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 10th day of September, 1897, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 11th day of October, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

F. METTMANN, Secretary.

Office—237 12th street, San Francisco, California. The Secretary will also receive payments from 12 to 5 P. M. at his business office, 225 Sansome street.

INYO MARBLE COMPANY.—Location of principal place of business, San Francisco, California; location of works, Ingo, Inyo County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 27th day of July, 1897, an assessment (No. 30) of 16 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, room 323 Phelan building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 28th day of August, 1897, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on MONDAY, the 20th day of September, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

M. A. CAHN, Secretary.

Office—Room 323 Phelan building, San Francisco, California.

OSBORN HILL GOLD MINING AND MILLING Company.—Location of principal place of business, San Francisco, California; location of works, Grass Valley, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 4th day of August, 1897, an assessment (No. 6) of 85 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the Secretary, at the office of the company, room 11, No. 331 Pine street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 6th day of September, 1897, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 27th day of September, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

R. R. GRAYSON, Secretary.

Office—Room 11, No. 331 Pine street, San Francisco, California.

CONSOLIDATED CALIFORNIA AND VIRGINIA Mining Company.—Location of principal place of business, San Francisco, California; location of works, Virginia Mining District, Storey County, Nevada.

Notice is hereby given that at a meeting of the Board of Directors, held on the 3d day of August, 1897, an assessment (No. 9) of 25 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to to Secretary, at the office of the company, room 29, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 8th day of September, 1897, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 29th day of September, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

A. W. HAVENS, Secretary.

Office—Room 29, Nevada block, No. 309 Montgomery street, San Francisco, California.

OCCIDENTAL CONSOLIDATED MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Silver Star Mining District, Storey County, Nevada.

Notice is hereby given that at a meeting of the Board of Directors held on the 3d day of August, 1897, an assessment (No. 28) of 10 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, room No. 69, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 7th day of September, 1897, will be delinquent, and advertised for sale at public auction, and, unless payment is made before, will be sold on THURSDAY, the 30th day of September, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

ALFRED K. DURBROW, Secretary.

Office—Room No. 69, Nevada block, No. 309 Montgomery street, San Francisco, California.

LIGHTNING WELL MACH'Y

PUMPS, AIR LIFTS,

GASOLINE ENGINES

THE AMERICAN WELL WORKS,

AURORA ILL.-CHICAGO.- DALLAS, TEX.

THORPE MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Fourth Crossing, Calaveras County, California.

Notice is hereby given that at a meeting of the Board of Directors held on the 9th day of June, 1897, an assessment (No. 7) of 2½ cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, room 44, Phelan building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 17th day of July, 1897, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on MONDAY, the 9th day of August, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

A. F. FREY, Secretary.

Office—Room 44, Phelan building, San Francisco, California.

POSTPONEMENT.

By order of the Board of Directors, the day of delinquency of the above assessment has been postponed to July 31st 1897, and the day of sale to SATURDAY, August 21st, 1897.

A. F. FREY, Secretary.

Office—Room 44, Phelan building, San Francisco, California.

POSTPONEMENT.

By order of the Board of Directors, the day of delinquency in the above assessment has been postponed to August 14th, 1897, and the day of sale to SATURDAY, September 4th, 1897.

A. F. FREY, Secretary.

Office—Room 44, Phelan building, San Francisco, California.

Wanted for the Yukon,

Two or three capitalists to become associated with two experienced explorers and gold miners, one of whom has spent five years in the Yukon and tributaries exploration, is thoroughly conversant with the topography of the whole Yukon auriferous belt and knows of valuable diggings yet untouched which can be secured and operated to great advantage by the methods proposed to be adopted. The highest references will be given, and required. Amount necessary for expenses and plant, $25,000. This being a genuine proposition only principals need apply. For further information, address

"YUKON," this Office.

WANTED.

Able, rugged man, as Roaster, thoroughly familiar with oxidizing dead roast of gold concentrates in Bruckner furnace. None other need apply. Address quickly, stating experience and qualifications.

JACKSON & LAKEVIEW MINING CO.,
LUNDY, CAL.

WANTED. — A Second-Hand 5 OR 10 STAMP MILL.

Address, stating particulars, price, etc., A. B., this office.

WANTED.

A position as Millman in quartz mill by young man, one who can keep a mill running. Address A. E. CHARLESWORTH, Lockeford, San Joaquin County, California.

FOR SALE.

The Following Machinery, Nearly New. Now Located in State Agricultural Exposition Building at Sacramento:

One 16x12 R. B. Poppet-Valve O'Neil Automatic Cut-Off, 100-Horse Power Horizontal Engine, built by the Union Iron Works, with Band Pulley, 22 in. x 24 in. Pipe Connections and Valves complete, as it now stands.

One 22 in. Double Leather Driving Belt.

One 18 in. Union Exhaust Steam Feed Water Heater.

One Buffalo Duplex Boiler Feed Pump 6x4x6.

Two Tubular Steam Boilers, 54 in. diameter, 16 ft. long, in good order, with Furnaces, Grate Bars and Settings complete; one Injector for each Boiler, and all the necessary Checks, Valves and Gauges.

One Stack, 48 in. diameter by 80 ft. long.

For price and particulars, address

EDWIN F. SMITH, Secretary, Sacramento.

For Sale.

23,000 Feet 10 5-8 Inch Steel Pipe,

Lap welded and screw joints. Weight about 27 lbs. per foot. Will stand about 600 lbs. pressure

Three Compound Duplex Worthington Pumping Engines,

Several Pumps and Heaters,

And everything pertaining to a plant capable of elevating 3200 gallons water per minute 550 feet. Plant only operated one week. Address

LEE CHAMBERLAIN & CO., Los Angeles, Cal.

FOR SALE CHEAP.

First-Class Air Compressor (Steam Driven) and Drill, New.

Also, 3-Ton Capacity Pulverizer.

A. L. FISH, 59-61 FIRST STREET, S. F.

FOR SALE CHEAP.

Gold Wet Washing Machine,

MAIT'S MAKE.

Capacity, 8 Tons Per Day.

Good order. Can be carried anywhere by prospector.

Address T. L., this office.

Valuable Silver and Lead Mining Property for Sale.

The property is known as the Montezuma Silver Mining Co. of Utah; is situated on the Little Cottonwood, Alta, Utah, comprising the "Montezuma," "Savage," "Hiawatha" and "Last Chance" locations, also the "Buckland" tunnel, 1500 feet long, and over it the "Savage" tunnel, 800 feet long, with openings connecting the tunnels. The mine is in good working order, with considerable ore in sight. The ore is rich in lead and in good demand by the smelters. For terms and any other information, address David R. Peirce, Sec'y and Treas, 210 West Larned St., Detroit, Mich.

Klondyke and California Mining Co.,

ROOM 5, NO. 410 MONTGOMERY STREET.

The Company will ship one hundred (100) men who may be able to go and who can pass a Medical Examination and who are physically sound, with a full and complete supply of Woolen and Fur Clothing, Blankets, Food, Supplies and Mining Tools for Alaska, sufficient to last each man one year. The List of Supplies and Clothing are set forth in the following lists, and each article is first-class:

CLOTHING AND FUR OUTFIT.

Three Suits of Underclothes,
Three Woolen Shirts,
Two Pairs of Overalls,
Two Pairs of Blankets,
Six Pairs of Socks,
One Fox Robe or Six Deer Robes Lined,
One Reindeer Parkee, comes over Head to the Knees,
Three Pairs of Cariboo Mits,
Two Fur Caps,
Two Pairs of Hip Rubber Boots,
Three Pairs of Moccasins,
One Muccinick,
One Mackinaw,
Two Pairs of Woolen Sweaters,
One Pair of Snow Glasses,
Ten Yards of Mosquito Netting,
One 8x10 Tent,
One Miner's Stove.

COMMISSARY OUTFIT.

Five hundred pounds of Flour,
One hundred pounds of Oatmeal,
One hundred pounds of Beans,
Twenty-four pounds of Coffee,
Twenty-four pounds of Tea,
One hundred pounds of Bacon,
One hundred pounds of Dried Potatoes,
Fifty pounds of Dried Vegetables,
One hundred pounds of Dried Fruits, &c.
One pound of Citric Acid for Vinegar,
One hundred pounds of Condensed Milk,
Five pounds of Baking Powder,
Fifty pounds of Canned Butter,
Five pounds of Salt and Pepper,
Thirty pounds of Lard,
Twenty-five pounds of Rice,
Twenty pounds of Tools,
Two pounds of Matches, etc.,
Twenty-five pounds of Soap, Borax and Washing Powder.

Included is transportation by steamer to Dawson City from San Francisco, via St. Michael's, the steamer to sail about August 12th or 15th.

The vessel will be a steam schooner of two hundred and fifty tons register, commanded by experienced officers. A physician and supply of medicines will go with the men. Medical attendance and medicine furnished to any of this party who are sick during the year; this is included in the price paid.

The price to be paid is Six Hundred ($600) Dollars. As the time is short no one is expected to apply who cannot pay the full amount to the Company.

Will ship men August 7th and 14th to Juneau by steamer Farallon, and pack all goods from Juneau to Dawson, Alaska.

JOSEPH RAY, Secretary.

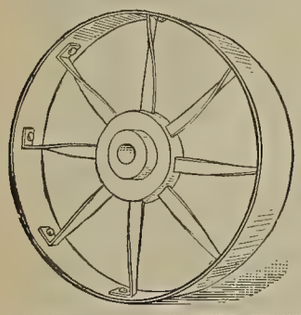
RISDON IRON WORKS.

SAN FRANCISCO, CAL.

MANUFACTURERS OF THE CELEBRATED

McBETH PATENT STEEL RIM PULLEYS,

WITH WROUGHT STEEL SPOKES.



The Strongest, Lightest and Best Metal Pulley in the World. Absolute Freedom from Breakage in Transportation.

WE ALSO MANUFACTURE ALL KINDS OF

Milling, Mining, Pumping, Hoisting and Marine Machinery,

Bryan Patent Roller Quartz Mills, Johnston Concentrators,

EVANS HYDRAULIC GRAVEL ELEVATORS,

RISDON ORE FEEDERS "CHALLENGE" TYPE.

Risdon Improved Concentrators, Frue Type. Risdon Patent Water Wheels, Pelton Type.

AIR COMPRESSING MACHINERY A SPECIALTY.

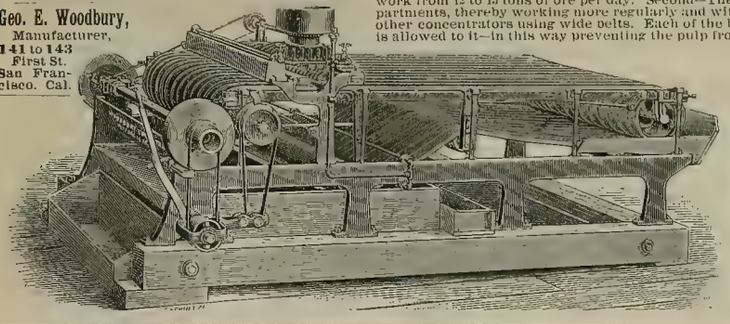
THE WOODBURY ORE CONCENTRATOR WITH IMPROVED BELTS

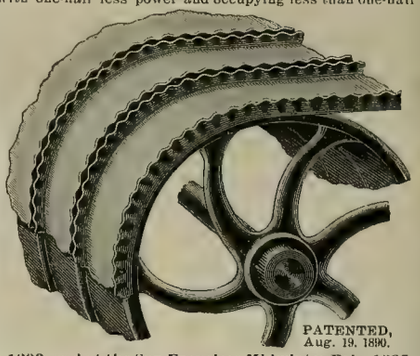
was awarded the Highest (Bronze Medal) Premium at Mechanics' Institute, 1890 and 1891.

MORE THAN DOUBLE THIS CAPACITY with one-half less power and occupying less than one-half the space of any other concentrator. Built of best Steel and Wrought Iron. Strong and durable. **Price $575 f. o. b.** Send for Catalogue and Testimonials.

The annexed cut shows the belt in its improved form, which consists of corrugated edges, to form an expanding top edge. THE IMPROVED MACHINE HAS THE FOLLOWING MERITS: First—The Improved belts, which consist of seven, are constructed and arranged so as to allow each belt to receive a portion of the pulp in such a manner as to relieve the machine of its load, thereby giving it twice the capacity of other concentrators, and enabling it to work from 12 to 15 tons of ore per day. Second—The machine equalizes the load by several compartments, thereby working more regularly and with much less attention than is necessary to give other concentrators using wide belts. Each of the belts on this machine takes care of the pulp that is allowed to it—in this way preventing the pulp from running to the lower side of it, as is the case when a machine becomes out of level where wide belts are used. Third—The belts run on a perfect line, needing no adjustment to prevent their running from side to side, as in other concentrators. Fourth—The belt surfaces are improved by indentations and corrugations, causing the Concentrator to save fine sulphurets and quicksilver, and perform close work. Fifth—The belts have fluted or corrugated edges, to form an expanded top edge, which effectually prevents from cracking. Sixth—The feed arrangement is perfect. Seventh—The machine is constructed of iron, with steel crank-shaft self-oiling boxes, and everything made in the most thorough manner, enabling it to run with very little attention or wear.

Geo. E. Woodbury,
Manufacturer,
141 to 143
First St.
San Francisco. Cal.





PATENTED, Aug. 19, 1890.

This Concentrator took the 1st prize at the San Francisco Mechanics' Institute in 1890, 1891 and 1892, and at the California State Fair in 1892; it took the 1st, prize at the World's Columbian Exposition 1893, and at the San Francisco Midwinter Fair, 1895.

PERSPECTIVE VIEW OF FURNACE.

PARKE & LACY CO.

21 & 23 FREMONT ST., SAN FRANCISCO., CAL.

Mining Machinery & Supplies.

Sole Licensee for the Manufacture and Sale of the

ROPP STRAIGHT LINE FURNACE

FOR ROASTING, CHLORINATING AND DESULPHURIZING ORES.

Extracts from Letters Received from Mr. Philip Argall, Manager the Metallic Extraction Co., Cyanide, Colorado:

January 2, 1897.

"The roasting is invariably good. We can do 80 tons per day to 0.13% sulphur, when everything runs smooth. Our month record which, of course, includes all delays, is 1700 tons, from 1.94% sulphur to 0.16%."

February 19, 1897.

"Our furnace is now running very nicely indeed, averaging 90 tons per day to 0.10% sulphur, and doing excellent work; in fact, it has improved right along and we are highly pleased with it.

"For 24 hours ending 7 A. M. to-day 102 tons were roasted."

The ROPP FURNACE is now in successful operation at the following reduction works: The Hanauer Smelting Works, Salt Lake City, Utah (one furnace); The Metallic Extraction Co., Cyanide, Colo. (one furnace); The Colorado-Philadelphia Reduction Co., Colorado City, Colo. (three furnaces); The Selby Smelting & Lead Co., Selby, Cal; (one furnace); The Mount Morgan Gold Mining Co., Rockhampton, Queensland (one furnace); and Broken Hill Proprietary Co., Broken Hill, New South Wales (two furnaces).

Catalogue on application.

MINE BELL SIGNALS. Adopted, Used and in Force in Accordance with State Law.

FOR THE CONVENIENCE OF OUR READERS IN THE MINING COUNTIES WE PRINT IN legal size, 12x36 inches, the Mine Bell Signals and Rules provided for in the Voorhies Act, passed by the State Legislature and approved March 8, 1893. The law is entitled "An Act to Establish a Uniform System of Mine Bell Signals to Be Used in All Mines Operated in the State of California, for the Protection of Miners." We furnish these Signals and rules, printed on cloth so as to withstand dampness, for 50 cents a copy. MINING AND SCIENTIFIC PRESS. 330 Market St., San Francisco.

Gold Dredging in Montana.

Dredging for gold is a form of gold mining that is yearly attracting increased attention. In California and New Zealand the results are satisfactory, and other sections are passing beyond the experimental stage. Two years ago this paper had an illustrated account of the first dredger in Montana, operating in Grasshopper creek, near Bannack. A few weeks ago a third dredger of greatly increased capacity was put in successful operation there. We are indebted to the courtesy of the Dillon, Montana, *Tribune* for the accompanying engravings. The Bannack Dredging Co. is the owner of the "A. F. Graeter." The Bon Accord Co. has placed an order for a fourth dredger in the same vicinity. With the "F. L. Graves" the Gold Dredging Co. cleaned up $80,000 in a four months' run last season.

These dredges take the place of the old rockers used in that vicinity for the past thirty years, and for thirteen miles below Bannack Grasshopper creek is devoted to placer mining with these effective appliances. The upper Sacramento in this State affords example of similar profitable work, and a dredge is now building at Smartsville, Yuba county, that is expected to be of practical value.

TABLE OF CONTENTS.

ILLUSTRATIONS.—General View of Bannack, Montana; Gold Dredging Co.'s Dredge, the "F. L. Graves;" Chicago M. & D. Co.'s Suction Dredge Before Remodeling; Bannack Dredging Co.'s Dredge, the "A. F. Graeter;" Chicago M. & D. Co.'s Dredge, the "Maggie A. Gibson," 141. Heavy Timber Work, Mascotte Tunnel, Alma, Colo., 144. Starboard Dynamos, 75 K. W. Each, Steamship Bremen; Cranes Showing Operating Handle; Aft Deck Bremen, Showing Eight Cranes; The Controller with Universal Gear, 148.

EDITORIAL.—Gold Dredging in Montana, 141. California Mining Not Advertised; Necessity and Profit of Narrow Gauge Railroads; Why Mining Properties Should Be Sold; Dredging the Rivers; Some Large Pieces of Gold; Silver's Decline, 142.

MINING SUMMARY.—From the Various Counties, of California Nevada and Other Pacific Coast States and Territories, 146-147.

ELECTRICAL PROGRESS.—Marine Electrical Equipment, 148.

SCIENTIFIC PROGRESS.—Electro-Deposition and Recovery of Gold; To Attain a Maximum Brilliancy; The X-Ray Again; The Emanation of the X-Ray; Experiment of Producing Light from Household Refuse; Effects of Alcohol; A New Magnesium Light; Action of Water on Quartz Under Pressure, 149.

MECHANICAL PROGRESS.—New Reduction Method; Analysis of Smoke; Railway Tracks; Everlasting Paste; Manjak; Experimental Pipe Driving; The Life of a Locomotive; Tight Belts, 149.

THE MARKETS.—Eastern and Local Markets; Mining Share Market; Sales in San Francisco Stock Board; Notices of Assessments, etc., 162-163.

MISCELLANEOUS.—Concentrates, 143. Annual Report of the California Debris Commission; Flashlight Photography; Everybody for Himself; Blue Asbestos, 144. Recent Additions to the Collections of the California State Mining Bureau; Rights of Miners in the Suspended Forest Reserves; Aluminum Alloys; A Great Heat; Coal the Result of Flotation and Deposition in Lakes, 145. Coast Industrial Notes; Personal; Recent California Mining Incorporations; Recently Declared Mining Dividends, 151. List of U. S. Patents for Pacific Coast Inventors; Notices of Recent Patents, 158. Books Received; Commercial Paragraphs, 163.

Silver's Decline.

The decline in the price of silver is of serious import. The political aspect of the question gives way to the commercial significance of the fact that silver is selling at 55⅜ cents an ounce, and the silver in a Mexican dollar at that rate is worth but 44½ cents in gold. There are no buyers. Even China for the first time in history is a seller. India has been a poor customer for three years, and, in general, conditions in the Orient have steadily tended to cause a depression in the price of silver.

The few mines in this country now yielding silver as a by-product have even the poor encouragement of possible profit taken away; any and every mine producing silver solely has been obliged to shut down.

Mexico figures that the fall in the price of silver (or the rise in the price of gold) may, if it continues, be of advantage there as encouraging domestic manufacture, the present condition being the same as an extraordinarily high tariff in that country; today a draft to settle a bill of $100 in goods bought here costs the Mexican importer $222.24. As between Japan and China the fall must encourage manufacturing in the latter country and turn the balance of trade against the former. India's present forlorn condition of famine places her outside the ordinary limits of business discussion.

The drop causes concern to European countries having large trade connections with countries having debtor obligations payable in gold, and may hasten the ultimate solution of the question by an international understanding.

The versatile American miner long since began other ways of earning a livelihood: when he found that silver was denied its ancient rights he simply started in to mine what was in more present demand, viz., gold and copper: should at any time these metals be at a discount he will furnish whatever the fashion of the day demands. While the low price of silver has been the ruination of many mines, and has caused a paralysis of entire sections formerly prosperous, it has occasioned such a development of the gold mining industry as to create new demand for men and machinery in that direction and thus partly compensate for the drop in the price of silver, that beginning seven years ago has now culminated in the lowest price for silver in the commercial records of the century.

Some Large Pieces of Gold.

Finding large gold nuggets is not so unusual a thing in California as to justify more than passing notice. Of course, what is seldom is wonderful, and because of this the recent little bunch of gold dust brought here from the Yukon has occasioned unbounded excitement, as such things are wonderful—for the Yukon—but the finding this week of the mass of gold in Trinity Co., in this State, hardly deserves the fuss made about it in the daily papers. The thousand columns of stuff that the dailies have had about the fairly sized batch of gold gathered all last winter in the Klondike are largely sensational. A murder or crim. con. case would elicit the same meretricious attention. In this no slur on the dailies is intended. That is their province, and they admirably fill their chosen field.

But to make such a fuss about so ordinary a thing as the finding of a great mass of gold in California would imply that was as much of a wonder as the year's scrapings so diligently collected in the Yukon tundras. The fact is that without in the least detracting from the size or value of the $42,000 piece of gold found by the Graves Bros. in the Blue Jay mine, Trinity county, Cal., this week, it is smaller than at least two other auriferous masses previously unearthed in this State. It is less in size and value than the piece found at Carson Hill, Calaveras county, or the lump found at Downieville, Sierra county, as mentioned by Louis Blanding, which was valued at $90,000. Another mass found in the Bonanza mine, Tuolumne county, gave a value of over $40,000. It is but fair to say that these were not "nuggets" but lumps of gold and quartz.

The largest piece of gold ever unearthed anywhere free from quartz, of which there is any record, is that taken out of the Byer & Haltman mine, Hill End, N. S. W., on May 10, 1872. It was imbedded in a thick wall of blue slate 250 feet from the surface; it weighed 640 pounds; it was fifty-seven inches long, thirty-eight inches wide, and averaged four inches in thickness; it was valued at $148,800. It is of interest to further state that the owners of the mine were subsisting on charity when they found it.

The "Welcome Stranger" nugget was found on Mt. Moliagel, Australia, Feb. 9, 1869. It weighed 190 pounds and was valued at $45,000. The Welcome nugget was found at Bakery Hill, Australia, June 9, '59; it weighed 184 lbs. 9 ozs. and was valued at $44,356. The piece found in Trinity county this week is a true "nugget," or was before being broken, being a solid piece of gold, shaped somewhat like a beaver's tail, and 38 inches long, 18 inches wide at the widest end and 5½ inches thick in that place; it weighed in place about 2470 ozs. It was broken in being taken out of where it lay, near an open cut twenty-five feet long, soft porphyry on the hanging wall, greenstone on the footwall, the nugget lying against the footwall. It is of regret that the piece could not be exhibited in its entirety.

Why Mining Properties Should Be Sold.

The oft-repeated but irrelevant question, "Why should a man want to sell mining property?" is now receiving practical and pertinent answer in Trinity county in this State. As has been so often pointed out in these columns, in that region as elsewhere in this State are placer properties that require capital to properly develop them. A man may have "a good thing," but be unable to do anything with it in want of money. Some time ago some Frenchmen, who first read in the MINING AND SCIENTIFIC PRESS in Paris of the rich placer ground of Trinity county, sent a representative to examine and report, with the result that they bought extensive holdings, purchased machinery, built flumes and ditches, put in many miles of pipe and are now taking out one thousand dollars per day. The manager expects to put in twenty miles more of pipe line "and take out $1000 per day for the next twenty years." At this writing two men—one an English mining engineer, another a San Franciscan—are examining another seven-mile stretch of placer ground in the same vicinity, which, it is believed, will probably be purchased by an English company, who will do what the adjacent French corporation has done, with, in all probability, the same satisfactory results. Of course, it would be better were California capital interested rather than foreign companies, for then the profits would be distributed here and not sent over the sea; but this is another story. The point is that these two recent instances effectually answer the question, "Why should a man want to sell mining property?" The former owners weren't able to work it; the present owners are, and are making a handsome profit.

Dredging the Rivers.

On page 144 appears the official report of the California Debris Commission for the fiscal year ending July 1st, '97, and in the light of recent events a matter of considerable importance to the interests affected.

Since the date of the report the operations referred to therein have established the fact that the Newtown shoal in the Sacramento river is fine sand which can be removed by dredger. Up to the present time it has been believed in some quarters that that and similar shoals were not movable ones; that theory is now dispelled. Engineers Nourse and Randall exhibit about 200 different specimens of sand taken from cross-sections of the shoal, which show a difference in composition. The deepest boring was thirty-seven feet, showing sand all the way. That part of the shoal deposited by debris from the hydraulic mines occasions the belief that the lower strata can be dredged as easily as the upper.

Every one in this State interested in the matter remembers the effort in the last Legislature—measurably successful—to get an appropriation, and, though that appropriation when secured had a string tied to it, it is believed that that appendage can now be removed and the work begun.

There is a little question of clashing authority here. Commissioner Leake says he will now go before the Public Works Auditing Board and argue for the immediate purchase of a $300,000 dredger. While no friendly action is to be slighted, yet it is possible that that matter is outside Mr. Leake's province, and that it were, on the whole, better to leave the matter in the hands of those who, whenever the work does begin, will have original jurisdiction and charge of it.

The California Debris Commission, composed of U. S. engineers, are the men who can best arrange for this work and conduct it. It is in their charge, and with them lies largely the say as to how and when the work shall be done.

TWO YEARS ago appeared herein a series of editorial articles calling attention to the necessity and profit of narrow gauge railroads in the foothills of this State, more especially in the gold-bearing counties, and especially designating Oakdale, Stanislaus county, as a good point to build from into Amador county. At that time the project and policy of this paper were fiercely attacked by an Amador county paper, the question being: "What would become of the stagers and freighters?" The result, however, of these articles in '95 now appears in the shape of twenty-three miles of the Sierra Railway already completed from Oakdale toward Stent and Jamestown, Cal. The result will of course be the increased development of the rich mining country the little road taps. A stage owner or blacksmith may lose a job, but the general public will be greatly the gainer. There are other localities in the State where similar enterprise would be in better line with the present requirements than sitting around whittling and telling of "the days of '49."

CALIFORNIA is unique in being the one great commonwealth whose great transportation companies treat with indifference its greatest resource. Every other mining State is magnificently advertised by the railroads that traverse it. The biggest and best advertisement the State of Colorado gets is the myriad of splendid pamphlets issued by its railroad companies regarding the extent and diversity of its mining industry. But not one word do the California railway people ever issue to indicate that this State has a mine of any kind within its borders. It is a singular fact, and stands in unpleasant contrast to the action of every other section of the Union fortunate enough to have metal mines.

Concentrates.

THE United States is now producing 1,500,000 pounds copper daily.

THE Le Roi smelter at Northport, Wash., is to be in operation January 1st, '98.

THE Katie mine at Basin, Montana, is to be reopened and the concentrator rebuilt.

THE Everett, Wash., smelter has raised its employes' wages from $1.35 to $1.50 per day.

THE Miners' Union of Butte, Mont., is nineteen years old and has a membership of nearly 5000.

THE Golden, B. C., papers say that there is no assayer there and that a good one would do well in that camp.

THE *Miner* says Rossland, B. C., is producing weekly 2000 tons ore and is in better shape than one year ago.

IT will be interesting in say February, '98, to compare the gold output of California for '97, with that of Alaska.

THE Canadian Government has abandoned its scheme to make Klondike miners pay royalty upon gold mines there.

THE Anchor Mining Company, of Park City, Utah, is holding a test of different makes of concentrators for low grade ores.

WELLS-FARGO have reconsidered their determination and will not establish an express office at Dawson City till '98, if then.

THE Denver *Daily Mining Record* is doing good work in exposing some of the mine swindlers that at present infest Colorado.

A LAWSUIT has been already begun over the claims in the Wadsworth, Nev., district, which is very good indication of their value.

THE Hutchinson mine, Olinghouse canyon, Nevada, produces at the rate of $13 to the ton, in gold; the cost of milling is $5.50 per ton.

THE Ontario and Daly, Utah, silver mines are closed down, it being impossible in other cases to operate at the present price of silver.

A FEW more local papers like the *Union-Democrat*, published at Sonora, Tuolumne county, Cal., would be of value to the mining industry of this State.

IN '95 Calaveras county, this State, produced $1,717,916 gold; Nevada county, $1,789,815; Trinity, $1,166,745; Placer, $1,599,634; Amador, $1,391,429.

NOTWITHSTANDING Trinity Co. and the Klondike, the price of gold and liberty—$20.67 per ounce and eternal vigilance, respectively—remain the same.

IT is believed that there is at present no exclusively silver mine in operation in the United States. There are several in which silver is a by-product.

EUREKA, Nev., which in the '70s was a lively base metal camp, is to have an ore sampling works. The old Eureka Con. plant has been leased by O. J. Smith.

"ORE BREAKS" is a term now offered in lieu of the time honored "fissure vein." An "ore break" is defined as "a break in the rock accompanied by ore."

THE customary "British syndicate" is reported to have bought the property of the Gold Creek Mining Co., of Nevada, for $15,000,000. The report lacks confirmation.

THE director of the Mint figures that Nevada produced 19,404 ounces of gold, valued at $2,648,300, in 1896. The silver product of that State for '96 he reports to be 1,048,700 ounces.

THIS paper admitted but one Klondike advertisement in its columns, wherein $600 each was asked for transportation and services, which, under the circumstances stated, was little enough.

THERE are thirty-seven people in Ohio who believe that they are the heirs and true owners of the great Comstock lode in Nevada, through a relationship to the Comstock after whom it was named.

THE last California Legislature made no change in the law regarding the posting of a notice on a mine disclaiming any responsibility on the part of the owner for expenses incurred by bonder or leaser.

A MIDDLETOWN, N. Y., firm engaged in manufacturing gold-dust bags of sheepskin for California customers are working with double forces on account of telegraphic orders received since the Klondike craze.

THE Klondike trails will be blazoned white with bones of those who perished. There is no comparison between that country and this, where, if pecuniarily unsuccessful, one can at least eat and enjoy life.

ANY CITIZEN of the United States may file in the patent office a claim to a partial invention, stating that he has not yet completed it, and praying protection until he shall have had time to bring it to perfection.

AT Owyhee, Idaho, the report is credited that the Standard Oil Co., is about to close a deal for the Trade Dollar and Black Jack mines, the holdings of the Florida Mountain Co., and the little Owyhee railroad, for $4,000,000.

GOLD galore is reported on the Amoor river, Jeho, China. Here's a chance for those who couldn't get standing room on a scow alleged to be headed toward Klondike. Get a sack of rice and a shovel and ho for the Jeho!

CRIPPLE CREEK, Colorado, produces as much gold in one month as the amount recently sent down from Klondike, which has apparently crazed a good many who had heretofore been credited with ordinary intelligence.

THE United States Government should immediately prepare to provide the inevitable relief expedition that will be implored to save from starvation ten thousand of the misguided men now thronging to the frozen North.

IT is estimated by Hamilton Smith and others who have given the subject attention that fully $180,000,000 in gold yet remains in the unworked gravel beds that lie between Smartsville, Yuba Co., and Graniteville, Nevada Co., Cal.

THE Southern Railway Company has issued a booklet treating upon the gold belt extending through the States of Virginia, North and South Carolina, Georgia and Alabama. These people claim to have a little mother lode of their own.

SECRETARY OF THE INTERIOR BLISS has issued a solemn warning to all and sundry to beware the dangers of the Klondike trip. It is well meant but useless. Those who go will go despite the plainest showing of peril, and are deaf to admonition.

ALREADY are being received at this office inquiries from Eastern States for information of "miners" who left home as much as two weeks ago to go to the Klondike and who, strange to say, have not been heard from in all that time. Evidently some Eastern people have a queer idea of geography, but they seem to know all about the MINING AND SCIENTIFIC PRESS.

SOME funny pictures are appearing of the Klondike district. One New York illustrated paper has an engraving "from our special artist at Dawson City," showing a mule pack-train loaded with ore.

THE Highland Boy mill, Bingham, Utah, has the largest mill structure there, a 100-ton affair, the process being a combination of plain amalgamation and the cyanide process. There are no stamps, the pulverizing being done by crushers and rollers.

J. B. GRANT says: "I have figured out that, with lead at 3.60 and silver at 55½, it is just about as profitable to a miner as when lead is 3.25 and silver 65," and argues that the present low price of silver will have no serious effect upon the production of lead.

THE seven-year Hale & Norcross litigation was argued and submitted before the Supreme Court this week in bank, upon an appeal from the judgment of the Superior Court, for $417,000, in favor of M. W. Fox and against Alvinza Hayward, H. M. Levy and the Hale & Norcross Mining Company.

AMONG the good results of the Klondike excitement are the greatly increased business along the coast in shipping, provisions and clothing, and the awakening of a good many to the fact that plenty of as good gold mines as any in Alaska are to be found very much nearer home.

THE results of thirty-one days' operation of the Hall mines smelter at Nelson, B. C., ending July 30th, are reported by Manager Croasdaile as follows: Amount of ore smelted, 3935 tons; yielding 313 tons of matte, containing approximately 144 tons of copper, 81,360 ounces of silver, and 84 ounces of gold.

IN A Utah court last Saturday was upheld the law of eminent domain, the judge deciding that the Silver King Mining Company could condemn land on which to construct a pipe line to convey water to its mine. Evidently the Kingdom of Deseret proposes to accord some of his ancient rights to the miner.

ALL PRESENT mining activity is not toward the north, the usual steady development work going on in every district and considerable new prospecting started. In a few instances in Amador and Calaveras counties working miners under pay left their jobs to join the rush, but their places can readily be filled.

IT is locally claimed that the stack at the Gaylord, Montana, smelter plant is the largest in the world at its base, as well as in diameter at the top. It is 200 feet 5½ inches high. The foundation base is 47 feet square and required 130 cars of stone. There are 1,500,000 brick in the stack and it is 22 feet in diameter inside at the top.

THE little plan to insure men's lives for $10,000 each, then "stake" them with $1000 to go to Klondike on prospecting trips, didn't work. The life insurance companies didn't recognize the usual percentage in favor of the game, seeing only a likely chance for the policy holders to make between $8000 and $9000 in each case of demise.

FOREMAN DUPUIS, of Carson, Nevada, is working on an invention of machinery to convert zinc plates into thin shavings to be used in the cyanide process. At the present time the shavings obtainable for the purpose are uneven. Mr. Dupuis' contrivance is intended to make the shavings precisely the same thickness throughout.

HEREAFTER no mining company outside of Ontario may transact business or sell shares in the province without first registering and securing a license. The penalty for violation is a fine of $20 for every day such business is transacted and three months' imprisonment. This shuts off many companies that have heretofore done business in Toronto and Ottawa.

DIRECTOR OF THE MINT PRESTON announces that the price of silver bullion makes the commercial ratio between silver and gold 36 to 1, and predicts that within six months silver will fall to 40 cents an ounce. He estimates that the world's production of gold this year will be about $240,000,000, of which the United States will contribute about $60,000,000.

ALL the gold brought from the Alaskan gold fields to the San Francisco mint and that sent to other mints of the country amounts to about $2,800,000. California contributed to the world's gold last year $17,181,562. This is the third year since the discovery of gold in Alaska. The third year in the California gold mining excitement gave to the mints (1850) $41,273,106.

THE recent protest of the American Copper Producers' Association, filed with the Senate ways and means committee, showed the total production of copper in the United States last year was 424,402,735 pounds. The output of the Arizona companies is given as follows: Copper Queen, 22,260,696 pounds; United Verde, 22,328,413; Arizona, 12,472,000; Old Dominion, 5,620,000; Detroit, 6,985,150.

PARTS of Utah object to the new mining law. The following is from the Salt Lake *Tribune*: "James T. Monk, ex-mining recorder of the Big Cottonwood mining district, appeared before Judge Cherry yesterday morning and again refused to turn over the records of the Big Cottonwood district to the county recorder. Judge Cherry ordered him committed to the county jail until he complies with the writ of mandate ordering him to produce the records."

INDIA'S absorption of silver for the four years, 1856 to 1860, was $257,500,000; during those years the total production of the world's mines was about $205,000,000. Professor Fawcett, in his "Manual of Political Economy," sixth edition (Macmillans), bk. III., chap. 16, gives the importation of silver into India during the eight years before 1867 at $600,000,000; the total production of silver from the world's mines during that period is set down at $372,500,000.

THOUGH an unusually large number of copies of last week's issue were published, the demand almost exhausted the supply. "That is just what I wanted," was the comment of several, "an accurate, scientific discussion by competent authority of the Klondike country." It is hardly necessary to say that, without any great flourish of trumpets, whatever is necessary to a proper understanding of things in that section will appear in these columns at least as soon as anywhere else.

THE Jesuit missions in the Klondike are in luck, if as is said, they are in the very heart of the gold region. The land consists of about three acres, which was purchased by the head of the mission, Rev. William H. Judge, a few years ago for a church, school and graveyard. One report says it is the richest part of the Klondike region, and provided some one does not jump the Jesuit claim, the returns should be large. The Jesuits, however, are men of peace, and hardly strong enough in that wild territory to maintain their right in case an effort should be made to push them out.

J. T. VAN SMITH, Prescott, Ariz., has patented a contrivance to save the fine gold which ordinarily escapes from a stamp mill. The device consists of several sets of silver-plated wire screens, kept in motion by a small water-wheel operated by the water running through the sluice. The water containing the tailings in suspension runs through about twenty of the screens, which take up the gold. These are taken out and the metal brushed off as it accumulates. The screens are then dipped in quicksilver and are again ready for use. It is practically automatic in operation.

THE Dominion Government has decided to appoint an administrator for the Yukon district with entire charge of all Canadian officials there. J. Walsh has the position. Thirty-five mounted police go with two Maxim guns. The recent mining rules have been amended. At present a miner is at liberty to stake out a claim of 500 feet running along with the stream and back to the bank. This has been reduced to 100 feet, the new regulation going into force immediately. A court for the administration of civil and criminal questions of the gold district has also been decided upon, Justice McGuire of Prince Albert to preside.

THE current number of *Electricity* publishes a letter from Arkadelphia, Ark., in which the writer makes the extraordinary statement that he owns several argentiferous galena claims which run in silver, 200 ounces to the ton, $10 gold, average 10 to 15 per cent copper, but cannot work it profitably on account of distance from railway. He wants to know if he cannot work it "by electricity." Galena that goes $10 in gold is considerable of a curiosity, to say nothing of 200 ounces of silver. The copper percentage of the "galena" is also a little unique. In such a claim as his, "distance from the railway" need cut no figure. The more distant the better.

A REPRESENTATIVE of the Omaha & Grant Smelting Company, in an interview in an Omaha paper, says that the duties on lead ore prohibited them from treating any of the British Columbia ores on this side of the line and they expect hereafter to do the bulk of their business at the smelter they recently purchased at Pilot Bay, and which they will start up on September 10th. President Nash of the company says that owing to the rapidly increasing production of lead ores in British Columbia more than one smelter company would find its way across the Canadian border in the next twelve months, and that these smelters would be literally driven out of the country by the high rate imposed on lead ore in the new tariff bill. In a year the Omaha Grant & Company has paid out $60,000 in import duties on ore from Kootenay mines, but cannot afford to import the ore at the new tariff rate.

SILVER CITY, Nev., mine owners met last week to effect a joint arrangement with the American Flat Tunnel Co., or the Comstock Tunnel Co., to drain and exploit the mines of that district to a greater depth than the present owners can afford to do. The American Flat Development Co. has under consideration the proposition of operating a pumping plant at the old Dayton works and running a tunnel to drain the mines of both Silver City and the American Flat. It had been found that two tunnels would be necessary for this project after a main tunnel had been run for some distance, one to drain the western country, and one which would run almost directly under Silver City, and that it would cost about $600,000, and if the mine owners would deed to the American Flat Development Co. a one-half interest in their claims, the company would put up the money.

ONLY a small percentage of the silver product of this country is now derived from ores treated by lixiviation and amalgamation. In Colorado there is not a silver mill in operation; in Utah there are only the Ontario and Daly mills at Park City, and they probably closed down this week, and a small works in the Silver Reef district. In Montana, where the Alice, Lexington, Bluebird, Granite Mountain, Bimetallic and Elkhorn amalgamating mills were in operation a few years ago, the entire production of silver bullion in 1896 was only 676,451 ounces. In Idaho the DeLamar mill is the only one of importance now running, and the ore it grinds contains as much gold as silver; in Arizona, where the Silver King mill was formerly a great producer, the output of silver in mill bullion is now only 125,000 ounces per annum; in Nevada mills on the Comstock lode are still in operation, but the Comstock ore averages 46 per cent gold.

GRAVES BROS. struck a pocket on Morrison gulch, a branch of Coffee creek, in Trinity county, near Trinity Center, one day last week, and before the sun went down took out $40,000. Don't rush to Morrison gulch! It is in California, where such things occur right along. Besides, it is too nice a country—too much grass and flowers and fruit and sunshine. If you want to rush go 5000 miles away where you must bring food and where, if your food gives out, you may starve. That gives an adventurous aspect that is denied an equally auriferous region all around you right at home. In four days Graves and Carter secured $61,000 in gold. The gold was found in the gravel about thirty feet from the surface, with no bedrock in sight. But remember this is only California! It is ever so much more heroic to go into the shadow of the North Pole and thaw through forty feet of ice and live on frozen blubber gnawed in the dark.

MR. PRESTON, Director of the Mint, has again spoken. He now estimates the gold production for the year 1896 to have been $205,000,000, of which the United States contributed over $53,000,000. For 1897 he believes the world's gold product will reach at least $240,000,000—an increase of $35,000,000 over 1896. He says: As an indication of the increase in the world's gold product for 1897, the following table, showing the product of the United States, Australia, South Africa, Russia, Mexico, British India and Canada for 1896 and the probable output of these countries for 1897, is given:

	1896.	1897.
United States	$53,000,000	$60,000,000
Australia	46,250,000	52,550,000
South Africa	44,000,000	56,000,000
Russia	22,000,000	25,000,000
Mexico	7,000,000	9,000,000
British India	5,800,000	7,000,000
Canada	2,800,000	10,000,000
Totals	$180,850,000	$219,550,000

He also believes that by 1901 the world's product will exceed $300,000,000.

Annual Report of the California Debris Commission.

Through the courtesy of the California Debris Commission we are enabled to give the recent official report in full, as follows:

GENERAL:—The California Debris Commission has the honor to submit the following, its fifth annual report:

The Commission was created by act of Congress approved March 1, 1893. During the past year its members have been the following officers of the Corps of Engineers, viz.: Colonel Charles R. Suter, President, Major Charles E. L. B. Davis and Captain Cassius E. Gillette, Secretary.

The State Debris Commissioner, the Hon. John F. Kidder, has been present at most of the sessions of the Commission, and has accompanied its members in visiting hydraulic mines.

Mr. Hubert Vischer, civil engineer, has been in the employ of the Commission throughout the year, inspecting the operations of mines working under permits from the Commission, and looking after illegal mining in the district under the Commission's jurisdiction.

The jurisdiction of the Commission extends to hydraulic mining in the territory drained by the Sacramento and San Joaquin river systems in California.

The duties of the Commission may be briefly stated to be: First, the prevention of such hydraulic mining as may be deemed injurious to the navigable waters within the Commission's jurisdiction, permitting, under proper legislation, such mining in cases where it can be carried on without such injury; second, to mature general plans for the improvement of the rivers whose navigability has been injured by hydraulic mining, and, if practicable, to devise general methods whereby such mining may be carried on without damage to the navigable waters.

Prevention of Illegal Mining.—In accordance with the opinion of the Attorney General of the United States (Appendix A, Ex. Doc. No. 11, Fifty-third Congress, third session), the Commission has since the date of its last report, July 1, 1896, called the attention of the owners and operators of ten mines which were being worked illegally to the requirements of the law and the duties of the Commission in the matter. So far as known these mines have been closed, and in five cases applications have subsequently been made to the Commission for the permits to mine. These mines are all small.

On June 8, 1897, the Commission received notice from the United States District Attorney that the injunction suit requested by the Commission on December 4, 1894, against the North Bloomfield Mining Company had been decided by Judge Ross of the United States Circuit Court in favor of the United States, and that an injunction had been issued. On June 22 the Commission was informed that an appeal had been taken by the North Bloomfield Mining Company, and that their motion to vacate the injunction pending the appeal had been granted. Under these circumstances it is unknown when an injuction that will cause the cessation of the apparently illegal work of this company will be obtained.

Applications and Permits.—The Commission has, since it organized, received 311 applications to mine; 238 permits have been granted. A table showing a synopsis of the applications received and the action taken is appended and marked A.

Eight permits have been canceled and 28 permits have been at different times temporarily suspended, generally on account of the neglect of the owners to comply with instructions concerning the impounding works, or from accidents to those works.

Several of the smaller impounding dams have broken or have been damaged during the year, but none of any importance excepting the dam connected with the Manzanita mine, near Sweetland, Nevada county. The permit for this mine was canceled January 19, 1897, for irregularities in its management. On January 25 the substantially built crib shaft connecting the settling pool above the dam with the tunnel underneath the dam collapsed from some unexplained cause, and the bulk of the material, about 130,000 cubic yards, stored above the dam escaped or will eventually escape into the Yuba river. This fact, together with the alleged blowing up with dynamite of a number of large dams in Slate creek, built before the Commission was appointed, illustrates the difficulty of securing permanent dams for large mines in streams of any magnitude, located, as most of them are, distant from inhabited neighborhoods, and dependent for their maintenance upon owners who have no direct interest in maintaining them.

The total amount of material mined under permits during the year is estimated at 1,256,910 cubic yards. The available storage provided at present and partially or wholly completed for future operations is estimated at 11,000,000 cubic yards.

The requirements in respect to storage of detritus exacted by the Commission during the past year have been the same as those during the previous year.

No dam for impounding detritus in the larger streams has as yet been authorized by the Commission.

Improvement of Rivers.—The duty of devising plans for the improvement of the rivers concerned devolves upon the Commission by Section 4 of the act. A Board, consisting of the same membership as the Commission, has been appointed in accordance with the act of Congress approved June 3, 1896, and charged with essentially the same duties. Under the latter act the Board has been making the necessary surveys of the Sacramento river. This work has not yet been completed.

The same river and harbor act also provides:

"For the construction of restraining barriers for the protection of the Sacramento and Feather rivers in California, $250,000; such restraining barriers to be constructed under the direction of the Secretary of War in accordance with the recommendations of the California Debris Commission, pursuant to the provisions of, and for the purposes set forth in, section twenty-five of the act of the Congress of the United States, entitled, 'An act to create the California Debris Commission and regulate hydraulic mining in the State of California,' approved March first, eighteen hundred and ninety-three: *Provided*, That the Treasurer of the United States be, and he is hereby, authorized to receive from the State of California, through the Debris Commission of said State, or other officer thereunder duly authorized, any and all sums of money that have been, or may hereafter be, appropriated by said State for the purposes herein set forth. And said sums when so received are hereby appropriated for the purposes above named, to be expended in the manner above provided."

The Legislature of the State of California on March 17, 1897, passed an act appropriating $250,000, to be used in conjunction with the above appropriation of the United States. This act provides:

"Whenever said 'California Debris Commission' or the Government of the United States shall have entered into any contract for the construction of works for the purposes described in this act, in pursuance of plans and specifications that have been theretofore approved by the State Board of Examiners as in this act provided, it shall be the duty of the Debris Commissioner to carefully inspect such works during the process of their construction and to keep a record of the result of such inspection and to report the same monthly to the State Board of Examiners. Said Debris Commissioner shall also from time to time, during the process of the construction of such works, when requested to do so by the said 'California Debris Commission,' draw his warrants upon the State Controller in favor of such person or persons as may be designated by said 'California Debris Commission' for such amounts as shall equal one-half of the cost of the construction of said works; and said Debris Commissioner shall, in like manner, and when requested to do so by said 'California Debris Commission,' draw his warrant upon the State Controller for an amount equal to one-half the purchase price of any site or sites necessary for the construction of said works: *Provided*, That the purchase of such site or sites shall have been first approved by the State Board of Examiners; *and provided, further*, that no warrant shall be drawn in excess of the amount appropriated by this act."

In compliance with instructions from the Secretary of War, the Commission has been developing a project for the expenditure of the money appropriated by the United States, and it is proposed to make this project so that the money appropriated by the State can be expended under it. The act of the California Legislature referred to is appended hereto, marked B.

MONEY STATEMENT.

June 30, 1897—Amount unexpended of appropriation for "Expenses of California Debris Commission, 1897".....	$ 8,983.3
Outstanding liabilities.....	10.0
Balance.....	$ 8,972.
June 30, 1897—Amount appropriated by act of June 4, 1897, for "Expenses of California Debris Commission, 1898"..	$15,000.0
Estimated necessary for expenses of the Commission to the close of the fiscal year ending June 30, 1899.....	15,000.0

Respectfully submitted,

CHARLES R. SUTER,
Colonel, Corps of Engineers.
CHARLES E. L. B. DAVIS,
Major, Corps of Engineers.
CASSIUS E. GILLETTE,
Captain, Corps of Engineers.

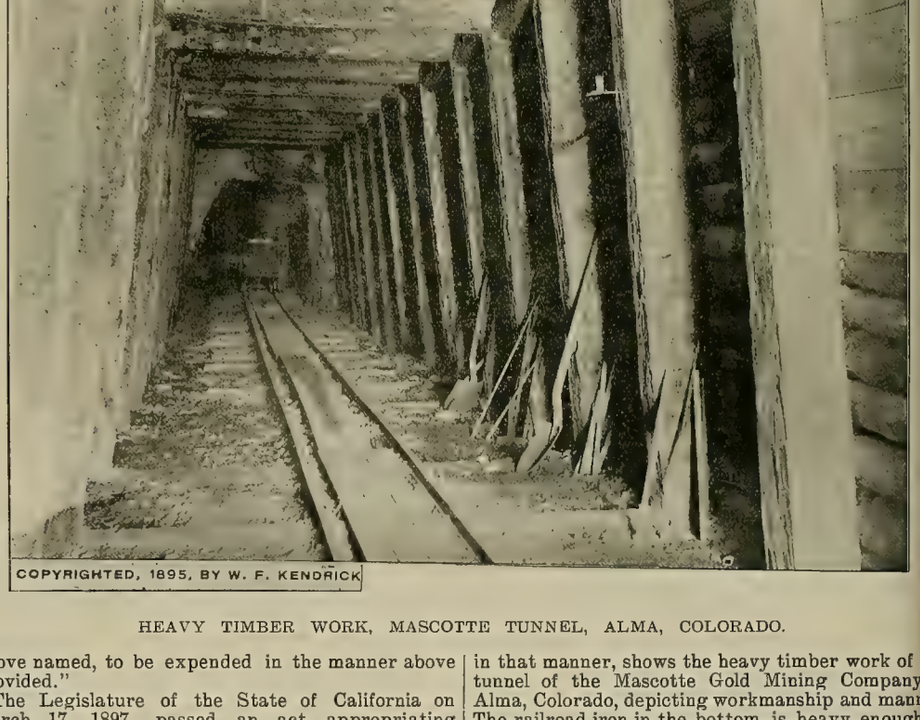
Brigadier General John M. Wilson, Chief of Engineers, U. S. A., Washington, D. C.

San Francisco, Cal., July 1, '97.

Flash Light Photography.

Frequently are portrayed in these columns underground work in California and Colorado mines, the flash light enabling a good view to be had in the momentary illumination.

The accompanying half-tone, from a photo taken



HEAVY TIMBER WORK, MASCOTTE TUNNEL, ALMA, COLORADO.

in that manner, shows the heavy timber work of the tunnel of the Mascotte Gold Mining Company at Alma, Colorado, depicting workmanship and manner. The railroad iron in the bottom is heavy enough to carry an electric motor with loaded train of ore cars. Underneath this, not visible in the picture, is a drain large enough to carry 2000 gallons of water per minute, sufficient to drain the mines of the mountain of its course.

A MINE is one place where, whether around the top or underground, everybody has not only to look out for himself but also for everybody else. Ordinarily one has only to take care of himself; a mine is one of the places where he must care for others, too. Because of this, those in charge owe it to all to be dulcareful about employing proper help. This is suggested at this time because of the fact that in one mine in this State, in Mariposa county, a young man under eighteen years of age is running a hoisting engine twelve hours per day. This constitutes a risk to himself and others. It is also a violation of Section 651 of the Penal Code, which says: Every person having a minor child under his control, either as a ward or an apprentice, who, except in viniculture or horticultural pursuits, or in domestic or household occupation, requires such child to labor more than eight hours in any one day, is guilty of a misdemeanor. See Stat. 1872; Stats. 1868, 63.

ASBESTOS formerly in use now has a formidable competitor in the blue asbestos of South Africa. The latter is less than half as heavy and furnishes finer and longer fibers, which have been worked into webs but little inferior to those made of vegetable fiber, are absolutely fireproof, and resist most known chemicals, corrosive vapors and atmospheric influences. A blue asbestos rope ¾ inch in diameter

is weighted at one end with 220 pounds, and exposed to a constant flame from a large gas jet so that a considerable portion of its length was surrounded by fire. It only broke after twenty-two hours. The asbestos rope has only two-thirds the strength of a new hemp rope, but as they grow older the proportion changes in favor of the former, since it is but little affected by the atmosphere. The blue asbestos fiber is also worked into mattresses for hospitals, which are cooler in summer and warmer in winter than those of animal hair or vegetable fiber. As an experiment, firemen's apparel is being manufactured from the fiber.

Recent Additions to the Collections of the California State Mining Bureau.

Gold quartz, from the Stringer district, Randsburg, Kern county, Cal.; L. L. French; tests show about $50 to $60 per ton free gold. Quicksilver ore, with cinnabar with dolomite; Great Western mine, Lake county, Cal.; A. Rocca, superintendent. Quicksilver ore, cinnabar; Chicago mine, Lake county, Cal.; from the company. Geode of chalcedony filled with aragonite, cut and polished; from the Healdsburg onyx quarry, Sonoma county, Cal.; Geo. Madeira. Wurtzite, sulphide of zinc; Lake county, Colorado. Gold quartz, showing free gold; Wedge mine, Randsburg, Kern county, Cal.; J. M. Kelley. Gold quartz, showing free gold; Kinyon, or Good Hope, mine, Randsburg, Kern county, Cal.; from the company. Gold quartz; from the Lucky Boy, Black Hawk, Gold Coin and Butte mines, Randsburg, Kern county, Cal. Gold quartz, Alameda mine, Johannesburg, Kern county, Cal. Gold quartz; Gold Bug mine, Rademacher district, Kern county, Cal. Gold quartz; Welcome and Exposed Treasure mines; from the new district three to four miles south from Mojave, Kern county, Cal. Model (in wood) of fine ore quicksilver furnace, recently invented and patented by C. E. Rockford of Sulphur Creek, Colusa county, Cal. Iron; rawhide bag used by the Mexican miners in the early working of the New Almaden quicksilver mine to transport the ore from the stopes to the surface on their backs. It is fitted with a broad strap, which passed across the peon's forehead, and smaller straps to steady the load. This interesting relic of early days was presented by C. C. Derby, superintendent, who also presented the museum with one of the old-style Mexican mine ladders. Gold in serpentine; from the hanging wall of the mother lode in the mines of the Mariposa Commercial and Mining Co., Bear Valley, Mariposa county, Cal.; J. D. Ludwig. Diamonds, rough; five specimens from a coal mine at Newcastle, New South Wales; R. W. Backrach. Phosphatic earth with 10.63 per cent of phosphoric acid; Jenolan caves, New South Wales. Copper ore, tetrahedrite, carrying gold and silver; cupro-scheelite, 57 per cent tungstic oxide; bismuthinite; native bismuth; rich silver ore; two varieties of tin ore; stannite; cinnabar, and ten specimens of rich gold ores from new districts; all from New South Wales, Australia, (Dept. of Mines). Gold quartz, assaying $200 per ton gold, from the Reward mine, Nevada County, Cal.; Hon. Samuel W. Backus. Gold quartz, showing free gold, and a considerable amount of chloride of silver (horn silver); Commonwealth mines, Bisbee, Arizona; from the company, per D. M. Barringer, secretary. And sundry other specimens.

July 24th, '97. H. S. DURDEN, Sec'y.

Rights of Miners in the Suspended Forest Reserves.

Mr. Gifford Pinchot, special forest agent of the Interior Department, thus replies to a query if the present regulations governing the suspended forest reserves deprive miners of the right to take and develop claims:

"The regulations issued under the law permit the development of mines under the same regulations which exist outside, with the exception that, where timber does not exist on a claim in sufficient amount to develop it, other timber may be used to the extent of $100 stumpage value without charge. For larger amounts a permit is required from the Secretary of the Interior. The text of the law is as follows: 'Nor shall anything herein prohibit any person from entering upon such forest reservations for all proper and lawful purposes including that of prospecting, locating and developing the mineral resources thereof, provided that such persons comply with the rules and regulations covering such forest reservations.' Another section is as follows: 'All waters on such reservations may be used for domestic, mining, milling and irrigation purposes under the laws of the States wherein such forest reservations are situated, or under the laws of the United States and the rules and regulations established thereunder.'

"The validity of existing claims and patents within the reserves is in no wise affected, while the settler is given the option of exchanging his claim or holding for the same area elsewhere outside a forest reserve, without cost to him, except that he must comply with the same conditions which would have been required on his original claim. Wagon roads may be constructed under authority from the Secretary of the Interior, and land may be occupied for schools and churches. There is no regulation prohibiting the ingress or egress of any person upon the forest reserves for lawful purposes, and in general the regulations have been so framed as to allow every possible freedom consistent with the preservation of the forests."

Aluminum Alloys.

Tin has been alloyed with aluminum in proportions of 1 to 15 per cent of tin, giving added strength and rigidity to heavy castings, as well as sharpness of outline, with a decrease in the shrinkage of the metal. The alloys of aluminum and tin are rather brittle, however, and, while small proportions of tin in certain casting alloys have been advantageously used to decrease the shrinkage, on account of the comparative cost and brittleness of the tin alloys, they are not generally used. Sometimes phosphor tin is used to give additional hardness to aluminum alloys.

Nickel is one of the favorite hardeners used in alloying aluminum. In proportions of from 7 to 10 per cent of nickel and the rest aluminum, the best casting metal is produced for purposes where toughness, combined with hardness and good casting qualities, is desired. "Nickel aluminum" has become a trade name. Several new nickel and aluminum alloys for special work have been made.

Manganese is one of the best hardeners of aluminum; it can be cheaply added in aluminum casting metal by means of the rich alloys of ferro-manganese, and for rolling purposes by adding the pure black oxide of manganese to the electrolytic bath in which the aluminum is produced. The alloys of manganese give special rigidity and hardness to aluminum; in combination with copper and nickel, one of the best hardening alloys of aluminum yet produced has been obtained.

The alloys of aluminum and tungsten have for the past few years been especially popular for rolled sheets and plates, to be afterwards spun. Under the trade name of "Wolfram aluminum," the metal has been largely used for military equipments. The alloys of aluminum and tungsten can be advantageously used, with the addition of copper, and also with the triple hardeners, tungsten, copper and iron; or tungsten, copper and manganese; or as more usually made, the aluminum is hardened with some copper; tungstate of sodium and ferro-manganese are added to the reducing bath, making an alloy of aluminum, copper, tungsten, manganese and iron.

Chromium, though rather expensive, is an especially advantageous hardener of aluminum. Aluminum hardened with chromium seems to retain its hardness, after annealing or being subjected to heat, better than any other of the alloys.

Titanium alloys of aluminum, although hard to manufacture uniformly homogeneous, have greater spring and reliance than most other aluminum alloys. Alloys of titanium, chromium and copper, together with aluminum, give some of the hardest and toughest light alloys yet produced.

Zinc is used as a cheap and very efficient hardener in aluminum castings, for such purposes as sewing machine frames, etc. Proportions up to 30 per cent of zinc with aluminum are successfully used. An alloy of about 15 per cent zinc, 2 per cent tin, 2 per cent copper, ½ per cent each of manganese and iron, and 80 per cent aluminum, has special advantages.

Aluminum and antimony unite with difficulty, and only in bearing metals of the class of Babbitt metals have any useful alloys as yet been discovered.

Aluminum and lead unite with great difficulty, and no useful alloys have yet been discovered.

Cobalt also acts, with about an equal amount of copper, as a specially good alloy for hardening aluminum.

The following are two cobalt and aluminum alloys used for special purposes: 50 parts cobalt, 10 parts aluminum, 40 parts copper; 35 parts cobalt, 25 parts aluminum, 10 parts iron, 30 parts copper.

Prof. W. C. Roberts-Austen discovered a beautiful alloy, composed of 78 parts gold and 22 parts aluminum, which has a rich purple color.

Aluminum and cadmium have been alloyed to produce a solder for aluminum, which seems to give good results. Cadmium does not appear to act appreciably as a hardener for aluminum, as do almost all other metals.

Aluminum and bismuth combine easily, the alloys being very fusible, as might be expected of alloys with bismuth. They remain unchanged in the air at ordinary temperatures, but oxidize rapidly when melted. Bismuth makes aluminum very brittle. No valuable alloys of these two metals have as yet been discovered.

Vanadium is a good hardener of aluminum, and can readily be alloyed with it, due to its presence in some of the bauxites that form native aluminum ores.

A TEMPERATURE of 4000 or 5000 degrees can be produced only between the carbon points of an electric arc light. The next hottest place in the world is the crucible of an electric furnace.

Coal the Result of Flotation and Deposition in Lakes.

The recent important modifications in our ideas of the manner in which coal was produced are summarized by Dr. Philippe Glangeaud in *La Nature*. It was not long, says the doctor, since we had no exact idea of the manner in which coal was formed. It was once supposed that it was due to the influence of the "central fire;" we were far from suspecting that it had an organic origin. It is chiefly by the discoveries of French scientists that we have been able to solve this problem, which is so important both from the scientific and practical point of view.

In the first place observation showed that coal is made up of vegetable remains, more or less altered, mingled with a brown substance, coming also from the decomposition of vegetable matter. This proof led certain scientists to believe that coal had come from the burial of forests in the place where they had grown. A luxuriant vegetation must have covered the soil, and on the remains of the vegetable species that fell and decayed sprang up new plants. This assemblage formed a considerable accumulation of vegetable matter. According to theories then in favor, a cataclysm soon took place; the forest was covered by waves charged with sands and clays, under which the vegetable mass disappeared. Quiet was restored, another forest grew on the remains of the first, and a new cataclysm covered this also with new sands and clays. Thus was explained the alternation of coal-bearing strata with rock and slate that was observed in coal regions.

This theory, which was current for some time, could not be sustained by a close examination of the facts. In fact, it was noticed that the layers of coal were very regular, and that trunks of trees had often been found with their roots in the air; finally, it was impossible to admit that vegetation could be preserved in the open air. It was necessary that it should be removed from the action of the air in order to be altered into a combustible mineral.

After having made a large number of observations of this kind, M. Fayol, a French engineer in charge of the coal mines at Commentry, was led to propose a new theory of the formation of coal—a theory based on facts and experiments, a rational theory, which has now gained the adherence of all scientific men. The mines of Commentry are in a part worked in the open air, so that it is easy to observe the relations of the different strata that make up the region. M. Fayol noticed at first that the pebbles constituting the pudding stones were formed of rocks whose place of origin was sometimes quite distant. As to the coal, it was the result of vegetable debris laid down in horizontal layers; one above the other. He concluded from these data that a liquid must have been necessary to transport and arrange in this way these different elements. Coal, then, was not formed in the places where it grew; it is a product of transportation.

The climate of the coal epoch being very moist, abundant floods carried away trees and whole forests and swept them into lake basins. The trees thus formed great rafts of logs, like those on certain American rivers. * * * The heaviest materials, gravel, sand, clays were deposited in the order of their density. The lighter vegetable matter floated longer and was deposited last. Thus is explained why the layers of the earth and coal are not parallel, and why all these layers, as has been observed in deltas, are inclined in the same direction and at different angles.

M. Fayol tested his hypothesis by experiments on rapid sedimentation. He produced, artificially, with the aid of small torrents, all the circumstances observed in the coal basins of the central plateau. The facts observed to-day at the mouth of the Mississippi make M. Fayol's hypothesis even more probable.

But the results reached do not stop here, from a scientific point of view. While the old theory required thousands of centuries for the formation of a coal basin, the theory of flotation enables us to understand that a relatively short period would have been sufficient to form the depressions in which the coal was deposited. The discovery of boulders of coal, found in several basins, even justifies the conclusion that the coal was formed before its transportation by the water. So coal was the result of flotation of vegetable matter and its deposition in lakes.

M. Glangeaud notes that not all coals were formed from trees and large plants. Some were the product of very small, almost microscopic, algæ that covered the surface of still water. Such were the coalbeds called "bogheads."

To sum up, attentive and careful examination of the constitution of coal enables us to understand the different ways in which it could have been formed, concludes the writer. Science has probably not said its last word, and perhaps new discoveries are at hand that will throw new light on the question of the origin of the most important combustible mineral, without which the activities of the nations would be quickly brought to a standstill.

Mining Summary.

CALIFORNIA.

Amador.

The Argonaut Mining Company of Jackson, Amador county, has commenced another, the fourth, suit against the Kennedy Company. The complaint alleges that since August 18, 1894, the defendant has extracted from plaintiff's mine over 3000 tons of gold-bearing quartz and carried away and converted the same to its use, and prays judgment against the defendant for the sum of $135,000 and costs of suit and also for a perpetual restraining order.

Ledger: At the Monte Cristo-Robinson the mill is running. T. B. Dillon has retired from the superintendency.

On the Mokelumne river H. F. Vogt is having ore from his mine crushed at the Esperanza mill.

The steam hoist at the Muldoon mine is now in operation.

Hoskin & Case have put up a 5-stamp mill on Contraros flat.

Butte.

Major Frank McLaughlin is opening up the Rock River mine.

Calaveras.

W. R. Thomas, superintendent of the Central Eureka, Amador county, and Stephen Thomas have purchased the Anderson mine, near El Dorado. Stephen Thomas, who will open the mine, was formerly superintendent of the Sierra Butte.

Cleveland, Callahan & Co. have developed a quartz ledge near Copperopolis that yields, according to a millrun test, $400 per ton in free gold, sulphurets $1000 per ton. The vein matter is 3 feet in width.

Prospect: The Stickle mine and Utica run full-handed day and night, turning out the usual product of gold.

At the Gold Cliff mine ten stamps are kept in constant operation.

The Cross shaft is now 900 feet in depth and will go 600 feet deeper.

The Great Western, Bovee and Madison are being worked.

Heavier hoisting machinery is being put in the Ghost mine.

At the Tryon mine the rock from the 200-foot level is of a high grade.

In the Lightner mine, stoping goes on. The mill at Centerville is crushing the ore from the 200-foot level.

Citizen: At the J. R. mine, at Old gulch, work will begin on the 10-stamp mill as soon as the machinery, which is now at Valley Springs, is hauled to the mine.

At the Greek mine, near Banner Mills, ten men are employed. The old shaft has been retimbered, and sinking has been commenced, which will be continued to a depth of 500 feet.

B. Jennings of San Jose has an option on the Orchard mine, the owner to receive 75 per cent of each cleanup until the purchase price, $6000, is paid, when the new management will be given a deed to the property.

At the Rocky Bar mine, near Murphys, Naylor Williams of Angels is working it under a bond to T. T. Lane and F. McNear.

Del Norte.

All the hydraulic mines in the Happy Camp district have been shut down to be got in order for the winter runs.

The Oranna quartz lead, Bald Hills, has incorporated; J. E. Murphy, J. Murray, J. McGowan, E. Yates; capital stock, $100,000.

El Dorado.

Near Brownsville the Stillwaggon and Rosebud mines have been bought by Messrs. Ireland & Barrows of Los Angeles, who will develop them.

F. C. Hendrick was in Jackson last Saturday and showed the *Ledger* a five-pound lard bucket full of rich quartz specimens, $1000 more or less, the result of five days' prospecting in El Dorado county. One seeing the gold would imagine he had just returned rom the Klondike.

Nugget: The Blue Gouge mine, Cosumnes district, has been bonded to an Eastern company. There are seven tunnels in the property now, and the mine is well opened up. It has been for some time in the hands of Mackay, Head and others. The new company will at once erect a mill.

The Griffith Consolidated mine, Diamond Springs district, is being developed. No mill has yet been erected.

Development work at the Unity progresses; crosscutting west from the 350-foot level.

Fresno.

Near Letcher the Copper King is being developed. Two 25-horse power gasoline engines and a pump are to be put in, and a three-compartment shaft is projected.

Inyo.

The Mammoth cyanide plant is completed and ready to start. Stewart's mill at Sodaville has resumed crushing.

Kern.

The strike on the Little Butte mine improves. Three shifts are at work. Shaft No. 2 at the west end of the ledge goes 50 feet deeper. A gasoline hoist goes in at shaft No. 1, which it is proposed to sink to a depth of 400 feet before any drifting is done.

Hollis and Curtis have bonded the Bower and Gold Bar claims and have men at work developing them.

Randsburg *Miner*: Manager Allen is working three shifts on shaft No. 1 of the Little Butte. The vein is widening and growing in richness. The new ore house is completed. A contract has been let for sinking the shaft on the westerly end of the claim 50 feet deeper.

The Yorkshire Lass Company has begun work on ore from the company's mines. The output of this group will be sufficient to keep the mill busy, and no custom work will be done. Twelve men are working on the Skookum and Yorkshire Lass.

The dry concentrator people are working eight men, grading, erecting mill buildings, etc.

Los Angeles.

A gold bar valued at $30,000, from the Red Rover mine, near Acton, has reached Los Angeles—the first run of the new mill started up thirty days ago.

Mono.

The Standard Consolidated Mining Company had a balance on hand August 1, 1897, of $21,452.62, with July expenses unpaid and the cleanup of bullion to be received. Complete returns show that the mine made a net profit of $10,000 for the month of July.

The Dunderberg cyanide plant started up this week. There are now thirty men at work at the mine.

Nevada.

Mrs. De Noon for her gravel property opposite the Derbec asks $125,000 and wants $80,000 down.

George Mainhart of Grass Valley will resume work at the Erie mine, near Graniteville. There is a 10-stamp mill on the property.

Bigelow & Fletcher are working the National mine, near Graniteville, under a working bond. A tunnel in 400 feet has a vertical depth of 200 feet and is in the pay chute about 100 feet; a 4-foot ledge in the face will go $10 per ton. The National has a 5-stamp mill.

The *Herald* is told that the Massachusetts Hill mine at Grass Valley is at present taking out more money than any mine in that district, and that the Pennsylvania mine is pounding out more gold with a 5-stamp mill than any mine with similar milling capacity in California.

The Powning Gold and Silver Mining Company has elected Geo. Mainhart president and superintendent; A. B. Brady secretary; Jas. Hosking treasurer.

The *Union* says the Reddick Mining Company will let a contract on Friday for sinking its main shaft 100 feet. The mine is on the Blue Tent road above Nevada City.

Union: The employes of the Champion Mining Company were paid off yesterday and over $22,000 was put into circulation. The company employs 230 men and eighty stamps are kept dropping night and day. Seventy of these are at the Champion mine and the other ten at the Spanish. The main shaft is now down 1850 feet and sinking is steadily kept up. During the past five years fifty-five stamps have been added and the mine is the largest of any in the county.

Placer.

In last week's issue the MINING AND SCIENTIFIC PRESS announced that the Morning Star Mining Company's 80th dividend was an $8 per share one. Three inquiries have been received asking if that wasn't a mistake, if $5 wasn't meant. Five dollars per share is the usual monthly dividend of this company, but this time it was as stated, $8. Mr. J. H. Neff, the president of the California State Miners' Association, is the general manager of the company, which employs sixty men, and has a mile of paying channel at Iowa Hill, opened by a tunnel three-quarters of a mile in length. The gravel is run through a 10-stamp mill, about 750 cars being daily worked.

From French gulch, twenty miles northwest of Redding, a strike is reported at the Milkmaid mine of free gold going $300 to the ton the width of the ledge.

At Blue Canyon the Lost Camp, a hydraulic mine, has a permit and is running. The owners are building a restraining dam in the American river. The Red Stone quartz mine is running a 10-stamp mill, netting $2 a ton on the rock they crush. The Doris mine is working a large crew and making a good showing.

(Special Correspondence).—The Big Dipper Mining Company has recently developed an extensive body of gravel at their property near Iowa Hill. No. 16 upraise, 3000 feet from the mouth of the tunnel, discovered a large body of gravel extending in a northerly direction as well as southerly and back along the line of the old works, but considerably to the east thereof. There is reason to believe that this body of gravel extends some 1600 feet to the south, paralleling the old works and separated therefrom by a high ridge of bedrock, this body of gravel being, however, on a higher level than that extracted from the old workings. A crosscut (and other drifts) from No. 16 upraise shows the gravel deposit to be 350 feet in width as far as developed, the east side not having been reached yet, however. The main bedrock tunnel has been driven 1000 feet north from No. 16 upraise. From this piece of tunnel several more upraises will be made shortly, and it is estimated that five months' further work will open up ground which will, with the present milling capacity, require six years to extract. Two years' work is at present in sight. It is necessary to extract 950 cars of gravel (of 2250 lbs. each) per week in order to keep the 10-stamp mill running continuously. This gravel, together with 150 cars of waste per week, is trammed by one man and one horse on each shift of 10 hours. The machinery plant consists of a 10-stamp mill (1050-lb. stamps), assisted by a rock crusher (the gravel being sufficiently cemented to require milling) and a 4-drill air compressor. The main tunnel has recently been driven by two 3-inch Ingersoll drill machines, working on eight-hour shifts, at the rate of 250 feet per month. The power plant consists of ditch, pipe line and Pelton waterwheels, together with a boiler for use in the dry season. About eighty men are at present employed by the company. The Big Dipper mine is located on the same ancient channel that was so successfully worked at Iowa Hill and Wisconsin Hill, and from which the Morning Star Mining Company is now extracting gravel. The piece of channel between the old Wisconsin Hill diggings and the Morning Star mine is now being worked through a bedrock drain tunnel by the Big Dipper Mining Company. The Big Dipper mine was ably superintended from January 1, 1895, to July 1, 1897, by George D. Blood, a graduate from the mining department of the University of California, who resigned to enter new lines in the mining industry, and is now in charge of the secretary and general manager of the company, Seymour Waterhouse, assisted by the foreman, F. H. Schulze.

Iowa Hill, Aug. 12th.

Sentinel: At the Occidental mine twelve men are employed. Wm. Cameron is superintendent. Depth of shaft, 341 feet.

The Eureka Drift Mining Company have reached the 68-foot mark in the upraise. The ground is very wet and they hope to strike gravel soon. This property is located above Forest Hill on the main divide.

E. W. Chapman, in the interest of the Bear River Hydraulic Mining Company, has bonded river claims from a point opposite Colfax, on Bear river, to Dutch Flat, a distance of nine miles. The claims are the Monte Rio, Ophir and other properties. A survey will immediately be made to convey water by means of a two-mile ditch from the South Yuba canal, near Cape Horn, to a hydraulic elevator at the river. The company hope to be able to operate next season.

Plumas.

Davis & Shepman of San Francisco have an option on the Phœnix, East Phœnix and Johnny Bull quartz mines, at the head of North canyon, for $20,000, the first payment of one-third to be made Feb. 1, 1898.

There is no mill running in the Genessee district, but a good deal of prospecting is being done there. On Grizzly creek there was much activity this spring in the gravel mines. Between Genessee and Indian valley the Taylor diggings are attracting attention. A dam is to be built across the outlet of Taylor lake and men are at work extending a ditch from the lake to the mine. G. P. Cornell tells the Oroville *Register* that sixteen stamps are running at the Crescent mill, five stamps on the Johnnie Bull mine, fifteen stamps in the Standard and McGill mine and ten in the Treleven mine. On the North Fork nearly all the gravel mines are active.

Fifty men are employed in the Eureka mine. Work is being pushed in the Little Jamison mine and ten more stamps are being added to the mill.

There are more men now prospecting for mines in Plumas than there has been for the past twenty years.

Independent: Thomas and Orr struck good pay last week on Emigrant Hill in which they sank a shaft into gravel and took out $50 for the first day's washing.

Riverside.

At Gavilan, the English company's shaft is down 265 feet, with a 5-foot vein. About forty men are employed.

San Diego.

It is credibly stated that S. W. Dorsey is about to build a 100-ton stamp mill at his Picacho mines, and contemplates building a railway thence to the Colorado river.

(Special Correspondence).—A large body of auriferous stibnite ore has been discovered in the Laguna mountains, sixty-five miles east of San Diego. It has an assay value of over 65 per cent in antimony and about $8 in gold per ton.

Quite a valuable find is the discovery "below the line," in Lower California, of two veins or ledges of manganese ore. The smaller vein is 3 feet wide at the surface and traceable readily for more than a mile. A good surface specimen assayed 57 per cent metallic manganese. It is soon to be opened up.

A report comes from the Jacumba valley, eighty miles easterly from San Diego, of the finding of a vein of galena ore 12 inches in width on top, an assay of surface ore from which yielded upwards of 4000 ounces silver per ton. It is being investigated.

San Diego, Cal., Aug. 10 '97.

Shasta.

At Sunny Hill the tunnel is in 700 feet, and an advance of 500 feet is being made.

Sierra.

The Shady Flat mine has been shut down. The Mountaineer mine has discontinued operations for the present. The Gold Valley mine has been attached and closed down by the employes.

Most of the hydraulic mines are closing for the season; the drift mines are in operation and turning out well.

The Ante Up and Brush creek mines are again active. A shaft is being sunk on each; grading and building a flume goes on; twenty-four men are employed.

The Thistle shaft is now unwatered.

The *Mountain Messenger* reports that at Deer creek, near Bassett's station, a company of six cleaned up 190 ounces of gold after a six weeks' run.

Siskiyou.

Journal: Coburn & Morrison have ten men at work at the Little Queen mine in Quartz valley.

The McKinley mine in Quartz valley has been closed down, as the expense of getting the ore to a mill is too heavy. All the profit is taken away by the time the clean-up is had. The owners of the mine are thinking of putting a mill on the property.

The Klamath River Flume and Mining Company will develop their property on an extensive scale

Journal: The copper ore in the Butteville mining district assays 31 per cent in copper, $22.60 per ton in gold. Dale Bros. are in about 40 feet in the lower tunnel, and have a big body of ore in sight. The ledge is estimated to be about 20 feet in width.

L. D. McArdle has a party at Klamath Chief group of mines, running lines for a four-mile ditch, through which water will be brought to the property from Coon creek and Wyman creek in time for the winter run of water. This is the property that T. J. Nolton recently sold to C. Hutchinson of Chicago.

The Klamath river miners of Honolulu district are working their claims energetically, this being the harvest time in taking out gold while the river is low and until winter storms commence again. On the upper Klamath, above Shasta river, work is also rushed with full force of hands, and the same may be said of claims on the lower Klamath from Oak Bar down to mouth of Scott river and Hamburgh.

Trinity.

A dispatch from Redding, dated August 11th, says the gold excitement was revived with renewed vigor here to-night by the receipt of news from Coffee Creek to the effect that $40,000 more of gold dust and nuggets was taken out yesterday afternoon from the pocket out of which the Graves brothers took their $42,000 last Saturday. They left in charge of their claim a man named Carter, who at one time was a partner in the claim, and Carter proceeded to work the claim as soon as the Graves boys left, and late yesterday afternoon he encountered another pocket and in less than five hours took out about an even $40,000.

There is plenty of gold in sight and all indications point to the taking out of a million from that single vein.

Another dispatch of the 12th says that news has just reached this city by private source of another exceedingly rich discovery of gold on Morrison gulch, about two miles from the scene of the Graves brothers' discovery. It is said $18,000 was taken out this afternoon, and that two miners, whose names are not known here at present, are taking out gold on an average of $40 to the pan. This strike is on the same vein of the Graves Blue Jay claim and is supposed to be an extension of the same.

The Paulsen hydraulic mines and Dutton's creek placer mines extending along the Trinity river from Douglass City, seven miles from Weaverville, to Lowden's ranch, about eight miles in length and comprising 1400 acres of territory, are under investigation by men representing English capital.

The *Journal* reports that D. C. Dedrick on the Chloride and Bailey mines, struck the ledge in the Chloride at a depth of 200 feet with a crosscut tunnel. The vein where cut was from 3 to 5 feet in width; the quartz is dark in color, carrying free gold and sulphurets, and is of a hard character. From careful tests it will easily go $50 a ton.

The Chloride and Bailey groups comprise sixteen locations. The main work has been done upon the Chloride location and the Bailey location, thousands of dollars have been expended in developing the mines and many thousands taken out.

Tuolumne.

At Saw Mill Flat there is a mine owned by Colin & Graham, in which the gold is a powder, so light that the wind can blow it like dust. It is 20.35 fine and is contained in cells in the quartz like honey in the comb. When the vein is blasted pans are held under the quartz to catch the gold as it falls from the shattered cells. In other places the gold is coarse and solid in the rock.

Carrigan & Co. of San Francisco have bonded the Lost Fox for $14,000 and will develop it. Meek & McGilvray are working 25 men at the Lady Washington. The shaft in the Green mine is unwatered and will be sunk deeper. The Mt. Vernon and Excelsior are also being reopened.

Sonora *Democrat*: J. and D. Coles have an option on the Stokes mine.

At the Porto Fino the vein has milled from $25 to $50 per ton, exclusive of sulphurets.

Supt. J. Tonkins is driving a tunnel to tap the Blue Lead. The rock is extremely hard, and it will require five months more.

The Buchanan mine will soon reopen, with J. E. Donohue as superintendent. When the water has been lowered below the 350 level drifting will begin at this point and a new shaft started 200 feet below the old one.

It is rumored that the Old Donila has been bonded by B. and T. Soulsby for $250,000.

The Andy Johnson mine at Chinese Camp will shortly be reopened by San Francisco men.

Yuba.

At Brown's Valley, the Webb Company have reached a depth of 930 feet on the Dannebrog shaft and are cutting a station at the 900-level preparatory to drifting east and west. The ledge in the bottom is 5 feet and, says the *Appeal*, has all appearances of permanency and good value. Twenty stamps are running night and day.

On the Hawkeye the Webb Company are down 50 feet vertically with a nice ledge in the bottom which shows free gold. From the bottom of the shaft the company is drifting on the ledge.

The water in the Pennsylvania is out to the 600-foot mark and the pumps are lowering it at the rate of about 20 feet per shift. From about the 400-level the company is drifting on the hanging wall up towards the Dannebrog.

NEVADA.

LANDER COUNTY.

Col. R. S. Thorp of Lewis district has started up his mill and has over 1000 tons of ore, chiefly silver, on hand. E. W. Brownell of Austin is the superintendent of the concentrator, which was constructed from the first ten stamps of a 40-stamp mill.

LYON COUNTY.

The Boston Nevada Copper Co.'s smelter in Mason valley will be completed this week. They have sunk 120 feet, struck water and stopped sinking until a hoisting works and pumping plant can be put up. On the McConnell claim three shifts are being worked, four men on a shift.

WHITE PINE COUNTY.

The new cyanide plant of the North Mountain M. & M. Co. at Cherry creek started on its initial run a week ago under the inspection of William Orr. To all appearances everything was successful on the start. C. T. Brant

has taken charge of the mill. The capacity of the plant is fifty tons.

STOREY COUNTY.

The Con. Cal. & Va. has arranged with the Kinkead Mill Company to work 100 tons of low-grade ore, assaying $11 per ton.

OREGON.

The Miller ledge and adjoining claims on Soldier creek, southern Oregon, have been sold to Simpson & Co. of Eureka, Cal., for $28,000.

BAKER COUNTY.

The Eastern purchasers of the Don Juan mine, Robinsonville district, are building another 10-stamp mill. The mine is being given scientific development. The 10-stamp mill which has been on the property and in operation for a year past continues work on rich ore. Thirty men are employed in the mine and on top.

The copper mines in Josephine county are started again. Mr. Keller is superintendent and A. W. McKeen foreman. Twelve men are employed.

W. J. Connors of Denver has bought of H., J. D. and F. E. Cabell the California mine for $30,000, full payment to be made inside of eighteen months and a 10-stamp mill operating by Dec. 1, '97. Six tunnels from different levels have reached one vein, showing an ore chute of 800 feet, with an ore body 2 feet wide.

WASHINGTON.

D. Hart, from the Okanogan, Spokane, has six gold bricks, the result of a 13-day run of a 10-stamp mill near Oro on ore from the Triune mine. The gold is 17 carat, and each brick is valued at $300.

BRITISH COLUMBIA.

W. E. Hall, superintendent Le Roi mine, Rossland, employs 180 men, hoisting 250 tons of ore daily. The daily output will be increased to 350 tons. The ore now goes to the Trail smelter. Developments are now being made on the 450, 500 and 600-foot levels. On the 600-foot level a crosscut at the bottom of the shaft shows 15 feet of solid ore.

During July 380 certificates of work were issued in Trail Creek, representing $38,000 worth of work done on claims. Two hundred and ninety-nine locations were recorded during the same period; 175 companies paid the license fee required by the new mining law, $17,250 revenue being obtained from this source.

The Rossland *Miner* reports that the California mine has been sold in Quebec. The property was purchased in the spring of 1896 by R. H. Pope and others, and a company organized with $3,000,000 capital. A limited amount of work was done when there was a shut down.

The 10-stamp mill at the Horse Fly hydraulic mine, Cariboo, which has been in course of construction for three months, has been started. The mill has ten stamps of 850 pounds, and crushes 120 tons of cemented gravel every twenty-four hours. It will be run by water power during the summer and by steam during the winter.

The Wonderful Group Mining Company on July 31st received a check from the Tacoma Smelting & Refining Company for $1544.47, returns from nineteen tons of ore, which assayed 70 per cent lead and 123 ounces in silver, and netted, exclusive of duty, $90.92 per ton. On August 3rd they received from the Kootenay Ore Company of Kaslo, B. C., a check for $1051.28, returns from fourteen tons of ore, which assayed 73 per cent lead and 124 ounces of silver, and netted, exclusive of duty, $92.55 per ton. The duty and customs on these two shipments amounted to $535.62.

The New York syndicate which bonded the Maud Hydraulic Mining Company's claim on the Quesnelle river some time ago for $100,000 and paid $5000 down, made a proposition to the company to pay a further sum of $5000 cash and renew the option till Jan. 1, '98, which was accepted.

(Special Correspondence).—There is very little excitement in Vancouver over the Klondike fever. Scarcely a dozen persons have left here for the faraway gold fields. This, however, cannot be said of Victoria. Large numbers are leaving there by every steamer.

Victorians are very indignant over the mass meeting at Seattle, which selected a committee to urge upon the United States Government the advisability of refusing bonding privileges to Canadians going to the Yukon in exchange for the duty imposed upon Americans for taking necessaries to existence into the country. Victorians say that as sure as the United States Government accedes to the request of Seattleites they will ask the Canadian Government to refuse bonding privileges to Americans going into Alaska.

Three crushing mills will soon be running—the 20-stamp mill at the Fairview, Okanogan, on the Tinhorn Company site, September 15th; the 10-stamp mill at the Golden Cache site, Lillooet, September 15th; and the 10-stamp mill at the Fire Mountain mine site, Harrison lake, near Westminster. If these companies save what they claim they will on the plates they will all be paying dividends, and the boom that will strike the seaboard will be more far-reaching in its beneficial results than the Klondike craze.

Vancouver, B. C., August 10, '97.

Ashcroft *Mining Journal*: At Quesnelle the M. & M. Company have shut down, owing to a shortage of water, for the season. The managers do not give out the output for the season. The mine is being worked at a disadvantage, owing to a limited water supply.

The Sydney Gold Mining Company have moved their scows up the river a few miles and will test their machinery pretty thoroughly before attempting the difficult trip through to Smoky river, where they have a large tract of dredging ground.

The dredger now in operation on the Quesnelle river, it is stated, will again try to work the river bed by a suction pump. Reports so far have been encouraging about the results of a dipper used. There is rich ground on the part of the Quesnelle where the dredge now is and if yards of gravel enough can be moved the work should be a success.

UTAH.

A modern mill of forty tons daily capacity for the concentration of its ores is to be erected at the Crystal mine, at Marysville.

Tribune: The Daisy group, on the Mercur West Dip, is to be incorporated. Preliminary arrangements have been made for the construction of a 200-ton mill, and it is the intention to have it completed and in operation on 100 tons a day by Dec. 1st. The new project will depend for power on the Telluride Power Company, which is under contract to furnish current for Capt. De Lamar's Golden Gate mill.

Record: At present the outlook for Park City is not very bright. Its only reliance for support is silver mining. That industry is practically killed, for only mines whose ores carry a heavy percentage of lead can be worked at a profit. There is but one such mine—the Silver King—in Park City. The Anchor never has paid, and with silver at its present price, it is very doubtful if it can be made to pay, even with the improved concentrating machinery the company is putting in. The silver-lead ores of the Daly West are not of as high grade as those of the King, and there is no hope of that property starting up until conditions change. The bulk of the Ontario ores is milling, and if the price of silver continues to drop that great property will soon have to follow the example of its sister, the Daly, which has already closed. That is the situation in Park City.

IDAHO.

R. J. Anderson of Boise has made the final payments on the placer property on Boise river purchased by the Twin Springs Company for $22,000. The claims purchased embrace about 1000 acres at different points along the river for twenty-two miles.

The Bond mill, the pioneer quartz mill of the Oro Fino, moved from its original location last fall, is owned by the Crescent Mining Company, Pierce City, who own five claims, all on the same lead. The vein runs 12 to 18 inches wide, free milling.

At Wardner, Idaho, the Bunker Hill and Sullivan has laid off most of the men while the mill is being overhauled.

At Kingston, H. W. Wheeler, president of the Idaho Antimony Mining Company, calculates starting the mill September 1st, and will concentrate the ore by heat instead of by machinery. The concentrates run about 80 per cent antimony. The capacity of the present plant is only 10 tons daily.

The lead crops along the west bank of Pine creek, lying less than 30 degrees from the horizontal, and is of unknown extent. During the old work an incline was run on it 170 feet into the hill. No other antimony in anything approaching paying quantities is known anywhere in the Cœur d'Alenes.

MONTANA.

Owing to the continued low price of silver the Alice mine, the oldest in Butte, has closed down, and others will follow.

The directors of the Montana Mining Company state that in July the 50-stamp mill crushed 3,320 tons of ore, which contained gold 1700 ounces, and silver 9480 ounces; estimated realizable value $39,300; expenditure—working expenses on revenue account, $26,400; outlay on developments, $6000; other, $300; total, $32,700; net result, $6600 for the month.

The Anaconda Copper Mining Company is developing its properties in every direction, says the *Miner*. Shafts are deepened, crosscuts and drifts extended, larger hoists put in, higher head frames erected, larger shaft houses built, while the usual quantity of ore, 5000 to 6000 tons, is produced daily. At the Buffalo sinking is in progress below the 800-foot level. At the Green Mountain a large new engine for sinking is in place on the 1400-foot level. About 700 tons of ore are hoisted daily. At the High Ore drifting is in progress to connect with the Mountain Consolidated, about a mile west. At the Mountain Consolidated No. 2 the shaft is down to the 1500-foot level. A new double-cylinder hoist 15x36 inches, manufactured by the Union Iron Works of San Francisco, is ready to be lowered into the mine, to be placed on the bottom level and used for sinking and development purposes. The new hoisting engine, Aztec, designed by the company's employes, has been in continuous operation about six months, hoisting on some occasions 600 tons of ore from a depth of 800 to 1400 feet, besides waste, timber and men, in eight hours, and could, if necessary, hoist much more; it is considered an economical steam user, and will hoist a four-deck loaded cage from a depth of 1200 feet with less than fifty pounds of steam pressure. At the St. Lawrence a new hoist 30x72 inches, high pressure double cylinder, manufactured also by the Union Iron Works, is almost completed. The roof of the shaft house is partly taken off, preparatory to putting up a higher head frame. The vein on the bottom, 1300 to 1400 feet deep, of the Anaconda, Never Sweat and St. Lawrence is in places over 100 feet wide, all ore, with some of it high grade.

SOUTH DAKOTA.

On the A. J. Smith group of claims in Ragged Top a body of ore assaying $1048 per ton in gold has been uncovered. The find has served to allay the Klondike fever.

WYOMING.

P. Steel has made a strike on Rock creek, half a mile west of Atlantic, from which he took two yeast powder cans of gold in one hour, which weighed $1200. The gold was in a small pocket near the surface.

Cheyenne *Tribune*: The Big Horn Placer Mining Co. begins active work on its placers near Hahn's peak next Monday. This company has spent $100,000 in getting water on the ground. A ditch eighteen miles long and a mile of steel pipe line have been built. The company expects to run from three to five giants during the summer. The ground to be worked is on Independence mountain, adjoining Hahn's peak. The values are said to average $1 per yard. With the arrangements made it is expected to average about 1500 yards of ground per day

COLORADO.

The new schedule for treating Cripple Creek ores at one of the mills is as follows, with no preference for oxidized ores: $10 ore, $7.25, treatment charge; $12.50 ore, $7.50; $15, $7.75; $18.50, $8.25; $20, $8.75; $25, $9.50; $30, $10.50; $35, $11; $40, $12. The rest of the millmen are fighting the cut.

The Telluride Power Transmission Company is installing a new Westinghouse motor in the works recently erected just below the Smuggler-Union 50-stamp mill at Pandora, to treat the Smuggler-Union tailings, by A. G. Kirby, says the Telluride *Journal*. The treatment consists mainly of running the tailings over a series of incline tables covered with canvas, the metals settling on the canvas and the silica and light matter passing over.

The annual meetings of the Anaconda and Victor mining companies, Colorado Springs, as reported by the *Telegraph*, show that no change was made in the board of directors of the Victor company. Superintendent N. H. Cone reported that development work is being carried on in the lower levels, the low grade ore being shipped to the cyanide plant of Florence. In these levels it was reported that very rich ore was being uncovered. The report of the working of the Victor mine shows the comparative shipments since 1893. In that year ore to the amount of $230,100 was shipped; in 1894, $202,229; in 1895, $480,000, and in 1896, $449,667. The monthly rate of dividend on the property has been $20,000, and the average number of men employed 120.

The directors of the Victor company are Eben Smith, R. H. Reid, G. E. Ross-Lewin, J. A. McClurg and William R. Brevot. The stock of the company consists of 200,000 shares, par value $5 each.

The report of the workings of the Anaconda property since 1893 shows the output in ore for each year to be: 1893, $51,000; 1894, $26,821; 1895, $120,000, and 1896, $185,000. The output fell off in 1894 because of the labor troubles in the district, since which time the returns have been steadily increasing, which is owing to the fact that low-grade ores have been successfully treated at the Florence cyanide plant. The directors of the Anaconda mine are David H. Moffat, David Rubidge, N. H. Cone, W. S. Jackson, Thomas Keeley, S. H. Reed and Eben Smith.

One of the largest air compressors made recently arrived at Telluride for the Tom Boy Gold Mines Company. At an ordinary altitude this compressor plant has a capacity of driving sixteen machine drills, but at the elevation the Tom Boy mine is situated—11,000 feet—it is calculated that it can only generate enough power to drive nine machine drills. The compressor was ordered for the purpose of expediting the development of the Tom Boy vein from the intersection of the mill tunnel crosscut which six weeks ago tapped it at a depth of 450 feet below the lowest of the upper workings.

At Cripple Creek the July output shows a total of $1,047,940, itemized as follows: Gillett reduction works, 1100 tons, averaging $30; value $33,000; all increase. Philadelphia smelter, 5000 tons, averaging $28; value $140,000. Brodie mill, 1690 tons, averaging $26; value $43,940. Metallic reduction works, 9500 tons, averaging $25; value $257,500: increase 1500 tons. Stamp mills, 1500 tons, averaging $10; value $15,000. Smelters, 8000 tons, averaging $70,000; value $560,000. Total tonnage, 267,090; increase over last month. Railway shipments—Midland, 450 cars of 9900 tons; F. & C. C., 1200 cars of 14,400 tons.

One of the numerous new cyanide mills being set up in the Rocky mountains this year is located at Summitville, and it will begin work this month. The superintendent says he has 5000 tons of $50 ore ready for it on the dump of the Aztec mine, besides enough ore in the mine to run a 30-ton mill three years. This certainly beats Klondike, says the Pueblo *Chieftain*.

Denver *Republican*: At Telluride A. H. Brown, Jr., superintendent Columbia-Menona M. & M. Co., is having development rushed; its 30-stamp mill is treating 100 tons ore every twenty-four hours, which yields ten to fifteen tons of concentrates on an average six ounces of gold, 300 to 400 ounces silver and 40 to 60 per cent lead per ton. There are over 100 men employed. The Columbia vein carries from 5 to 8 feet of ore, consisting of large streaks of gray and yellow copper decomposed quartz and prophyry it is easily mined. The mill is being principally supplied with mineral from the lower workings, where the quartz and prophyry streak assays as high as six ounces gold per ton.

NEW MEXICO.

The Hornbeck and Osberg mine, four miles northwest of Elizabethtown, has a lead 14 inches thick, which assays $3,625 per ton.

At Red River a contract was signed last week by the agent of a St. Louis house for the erection of a 25-ton stamp mill and a new chemical patented process for treating ores, whereby it is claimed that a large percentage of mineral, wasted in other plants, will be saved. It is claimed that this is an entirely new invention and hitherto unknown to mining men. It will be erected for the Challenge, Gold Hill and Iron Bird, and will be located near Hemitite, a camp about eight miles east of Red River. The contract specifies that the plant shall be in operation within ninety days.

An 80-horse power steam hoist is being erected at the Montezuma placer, and the force of men employed has been largely increased. Water is in abundance, and that part of the district is perhaps the most thriving at present, although further down the river, west of Red River, and as far as the Columbine, great activity is being shown.

ARIZONA.

At the King of Arizona, two shifts are taking out high-grade ore. The last mill-run of five days gave a $3000 brick.

At Phœnix the Bay Horse Mining Company—capital stock $125,000, $200,000 paid up, R. Garvey, J. A. Stevenson and F. H. Keith of Los Angeles—and the Laurel Mountain Mining Company, Los Angeles—capital stock $1,000,000, $805,000 subscribed, H. H. Laflin, O. J. Weber, H. M. Weaver, J. R. Manning, J. L. Stanley, D. O. Donoghue, G. S. Stewart, P. J. Holloway—have incorporated.

The Consolidated Copper, Gold & Silver Mining Company was incorporated at St. Louis, Mo., by S. and C. H. Peck, T. Randall Jr., J. W. Wallace, J. H. Canavan; capital stock, 300,000 shares, $5 each. The company's mines are in the Silver Reef mining district, fourteen miles below Casa Grande. The property was bonded last January, and the development work since done upon it, under the direction of Mr. Canavan, is said to more than realize expectations. Thomas Rankin is secretary and J. H. Canavan superintendent of the mines.

Farrell & Migeon vs. Arizona Copper Company is the title of a suit filed in Graham. The plaintiffs allege that the defendant has been using converters at their plant in Clifton embodying a process of converting copper matte into commercial copper on which there is a patent, and that they are the exclusive agents in the United States. The complaint states further that the process was patented by Pierre Mauhes, of Lyons, France, and patent papers were issued first in the United States July 21, '91. The complaint prays for an injunction to stop the using of this process until the case can be settled.

MEXICO.

The Copper Queen Company of Bisbee, Arizona, have purchased the Narcasori mines in Sonora.

The dredging boat for sluice mining recently put upon the Yaqui at San Antonio de la Huerta, by Wm. Schuckman and associates, was obliged to suspend operations by high water in the river before it had fairly commenced running. In the course of a few weeks the waters will subside and then work will be prosecuted with vigor.

Gold and copper are reported discovered in the Ajo mountains in Sonora. The district lies in angle formed by the Bisbee, Nacosari and Cananea copper mines. The claims already located in the Ajo district lie about 120 miles from Nogales and seventy miles from Bisbee. The formation is porphyry and lime.

The Santa Rosalia mine, owned by John Daggett and other San Franciscans, has declared another monthly dividend of 10 cents per share, a total of $10,000. The east drift has been advanced to 60 feet and the face is still in ore. The entire drift on both sides of the shaft is in ore—a distance of 180 feet.

VENEZUELA.

The Orinoco Company, of Faribault, Minn., owners of a 14,000,000 acre concession in Venezuela, has leased to J. E. Searles and others iron mines on the Orinoco river at a royalty of 12½ cents a ton with a minimum output of 500,000 tons. The lessees stated that they will mine 3,000,000 tons a year.

SOUTH AFRICA.

The directors' report to shareholders of the Bobinson mine, Johannesburg, for May contains the following:—Mine—Quartz mined, 15,186 tons. Development—Drives, 633 feet; rises, 203 feet; crosscuts, 357 feet; total, 1,193 feet. Mill—Stamps at work, 120; net running time, 29¼ days; tons crushed, 15,186 tons; tons per stamp per diem, 4.3 tons; gold won from above, 10,800 ozs 12 dwts. Chlorination and Cyanide Works.—Gold won from own concentrates (by chlorination), 977 ozs 0 dwts; bullion from tailings (cyanide process), 2,656 ozs 18 dwts; bullion from slimes (recovered by Rand Central Ore Reduction Co., Ltd.), estimated, 1,020 ozs—total from own ore, 15,454 ozs 10 dwts; gold from concentrates purchased (by chlorination), 5,784 ozs 9 dwt—total, 21,238 ozs 19 dwts. Production for June:—Mill—120 stamps at work; 14,980 tons of ore crushed; yielded in smelted gold, 10,076 ozs. From concentrates (by chlorination), 960 ozs; from tailings (cyanide process), 3,566 ozs; from slimes, 2,981 ozs; from own ore, 17,583 ozs; from concentrates bought (by chlorination), 5,412 ozs; total gold recovered, 22,995 ozs; profit for the month, £35,000.

The total June crushing on the Rand was the record one of 251,529 ozs, against 193,640 ozs in the corresponding month of last year.

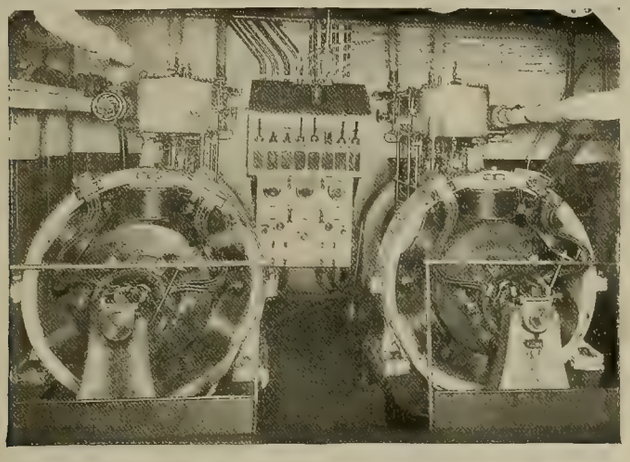
The Wemmer directors' report for May: Profit for month, £8050 1s 9d. Capital Expenditure—Development (398 ft. driven, sunk and risen), £1422 13s 3d; No. 2 new main shaft, 57 ft., £984 4s 5d; No. 2 new main shaft equipment, £1561 19s 8d; buildings and improvements, £180 16s 2d; machinery and plant, £1052 16s 4d; reservoirs and dams, £298 3s 11d; total, £5500 13s 9d—less development redemption, £2376 10s—£3124 3s 9d. Output—Mill, 3532.65 ozs.; cyanide works, 884.15 ozs.; concentrates (estimated), 920 ozs.; total, 5336.80 ozs. Crushed during the month—South Reef, 3352.22 tons, 49.37 per cent; Main Reef Leader, 3437.78 tons, 50.63 per cent. Mining and development—Feet driven, sunk and risen, 398 ft.; ore opened up by development, 11,536 tons; ore mined, 8049 tons; clean ore for the mill, 6425 tons; waste picked out (20.18 per cent), 1624 tons. Reduction—50 stamps ran 29 days 12 hours 49 minutes; ore milled, 6790 tons; duty per stamp per day, 4.6 tons; yield of bar gold, 3532.65 ozs.; yield per ton crushed, 10.4 dwts. Cyaniding—Tailings treated, 4500 tons; yield of bullion, 884.15 ozs.; yield per ton treated, 3.929 dwts. Concentration—Tonnage caught, 160 tons; average assay value, 5.75 ozs.; fine gold per ton of ore milled, 2.709 dwts. Yield (fine gold) per ton treated—By amalgamation, 9.029 dwts; by concentration, 2.709 dwts; by cyanide, 3.123 dwts; total extraction per ton, 14.861 dwts.

Electrical Progress.

Marine Electrical Equipment.

The steamship Bremen of the North German Lloyd line, which recently made her first transatlantic trip, is, perhaps, more fully equipped electrically than any other vessel of the merchant marine in the world. Aside from the usual electric lighting plant, she has a very complete and most novel power plant, the successful operation of which is now fully conceded.

The first power installations on the steamers of the North German Lloyd, were made by the Union Electricitats Gesellshaft of Berlin, the German ally of the General Electric Co, of Schenectady, N. Y., on the steamships Darmastadt and Prinz Heinrich; in these two cases the familiar and noisy donkey engine were superseded by electrically operated winches and it was the successful operation of these that determined the North German Lloyd to extend the use of electricity to the Bremen. In this case, however, in lieu of winches, a full equipment of electric cranes was installed. These cranes are sixteen in number, eight on the starboard side of the vessel and eight on the port side. Four of these have a capacity of 3000 kilograms, or 6614 pounds, and twelve of 1500 kilograms, or 3307 pounds, and have a total swing outboard of 20½ feet.



STARBOARD DYNAMOS, 75 K. W. EACH, STEAMSHIP BREMEN.

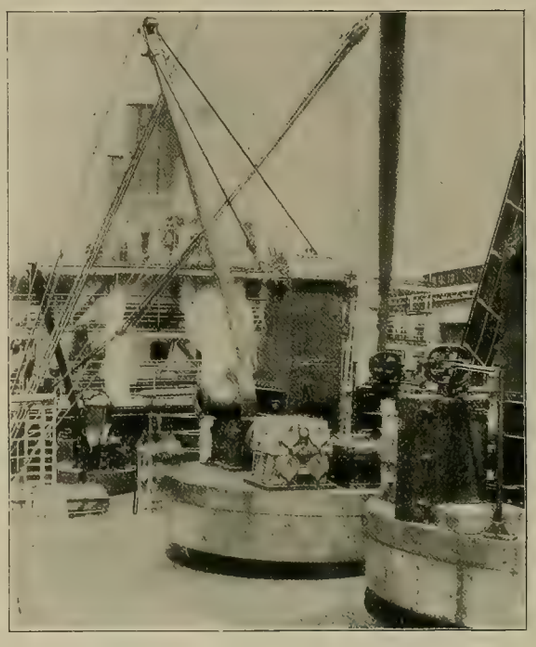
The power-generating plant is located in the after portion of the engine room and consists of four dynamos each directly connected to its own engine. Two of these are placed on the starboard side and two on the port side. The dynamos have each a capacity of 75 kilowatts, or 100 H. P., and run at a speed of 210 revolutions per minute delivering current at a pressure of 105 volts. The output of two dynamos is used for the cranes; one is used for the lighting of the ship, and the fourth dynamo is held in reserve in case of accident or other emergency. The engines are of the triple expansion type and were built by Schichau of Elbing, near Danzig.

The most notable feature of the electrical equipment is the cranes, the lighting installation conforming to the standard practice. In designing the cranes, the principal requirements specified and obtained were as follows: The load should be lifted smoothly; the resistance should be so arranged that the various speeds of the motors should be obtained without too apparent and sudden change; the control of the different motions should be instantaneous and positive, these motions to be effected in the smallest possible space; the cranes to be compact and contain the smallest possible number of parts; the controlling mechanism to be of the simplest to suit the class of operators likely to handle them; and the electrical apparatus to be absolutely protected against changes of weather, inroads of dust and sea water and to be of such a nature as to withstand rough handling. In addition all conductors were to be carefully protected and the last consideration, but by no means the least, on a passenger carrying steamer destined to be constantly loading and unloading, the operation of the cranes was to be noiseless. In conforming to these requirements, the Union Electricitats Gesellshaft has produced what is the latest and a very decided innovation in a ship's equipment.

AFT DECK BREMEN, SHOWING EIGHT CRANES.

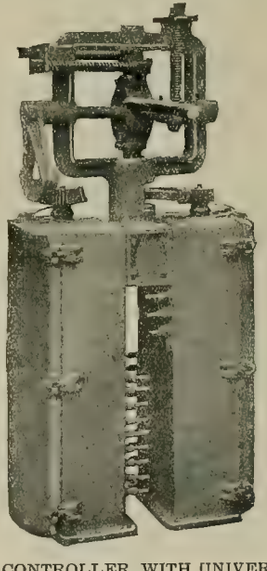
The cranes, motor and controlling mechanism are mounted upon a circular iron platform which revolves upon a pivot. This is turned by a motor of 7 H. P. running at 700 revolutions per minute, directly coupled to a worm gear which in turn meshes in a gearing bolted to the deck. The loads are raised by a 25 H. P. series motor, running at a speed of 900 revolutions, and driving a special worm gear meshing into the gear of the drum. On the gear end of the drum shaft is fitted a winch head.

The controllers resemble a double street car controller about 2 feet high.



CRANES SHOWING OPERATING HANDLE.

They are fitted with magnetic blowout, any spark being immediately extinguished in a magnetic field. The contract cylinders are operated by a special mechanism actuated by a simple handle or lever, the movements of which correspond to the movements of the load. Raising the handle raises the load, depressing the handle lowers the load and movement of the crane to the right or left is obtained by corresponding movements at the lever. Raising and swinging movements can be effected simultaneously. So simple are these operations that the dullest stevedore can handle these cranes with ease. Motors and controllers are water tight and dust tight but the cases of both can readily be opened when necessary. To give a more perfect control both motors are provided with band brakes operated by the foot.



THE CONTROLLER WITH UNIVERSAL GEAR.

These brakes are attached to an extension of the motor shaft.

The difference between the large and small cranes lies in the hoisting speed. Practically both cranes are identical in electrical equipment, but the hoisting speed of the 3000 kilogram crane at full load—60 feet per minute, is only half that of the 1500 kilogram crane at full load—120 feet per minute. The movement of the jib of the cranes is 13 feet per second.

The most remarkable feature of the cranes, however, is the absolute noiselessness of their operation. During the visit paid by the writer of this to the vessel, the whole eight starboar cranes,

four on the aft and four on the forward deck were engaged in discharging cargo. Had the operation of hoisting and lowering not been witnessed, it would have been difficult to detect the fact, had it been necessary to depend upon the ear. It is this feature that will recommend the electrical cranes to shipbuilders, especially those of passenger steamers in such trades as that of the Mediterranean, where loading and discharging is effected at every port, and great credit is due the North German Lloyd Steamship Co. for first effecting this great innovation.

Scientific Progress.

Electro-Deposition and Recovery of Gold.

Zinc was the only medium used for separating gold from its cyanide solution until the electrolytic method was applied. Although the electro deposition of gold seems to be a simple matter, yet when it comes to treating 100 to 150 tons of a very weak solution of cyanide containing a very small proportion of gold, it presents many difficulties, not the least of which is the selection of a proper material to be used for construction of the anodes. All nitrate, without exception, appears to dissolve at the positive pole in a cyanide solution, although iron seems to resist the action to a certain extent. Carbon is also attached. The author has found an anode which is neither a metal nor carbon, and which seems to resist the action taking place at the positive pole in a cyanide electrolyte, and does not decompose or spoil the solution. These anodes consist of lead plates covered by a coating of peroxide of lead. They are made by placing the plates in a solution of plumbade of soda, in which they are rapidly coated with peroxide of lead, then withdrawn, washed, and placed in a strong cyanide of potassium solution, where under a heavy current, they become hard and leave a good crystalline appearance. As cathodes, he uses iron plates, since gold adheres better to iron and steel than to any other metal, and recovers the gold by dipping the iron plates for about one minute in a bath of molten lead or bismuth kept at the proper temperature. An alloy is at once formed which becomes richer and richer in gold, and which can easily be cupelled yielding the bullion in an absolutely pure condition.—E. Andreon in Journal of Society of Chemical Industry.

In the Welsbach and other bright incancescent lights the oxides for the mantles must be chosen with great care, as well as must their proportions, to attain a maximum brilliancy. The best results are reached with about 99 per cent of thoria and 1 per cent of ceria. The presence of any other of the rare earths does not improve the light, and a greater or lesser proportion of ceria is detrimental. "Russium" nitrate, the use of which has been recommended in the place of cerium, proved in one case to be a mixture of thorium nitrate with much cerium nitrate, and in another case to be a mixture of cerium and ammonium nitrates. "Lucium" oxide is impure yttria. The best source of thoria is monazite sand, and the price of thorium nitrate has fallen from $500 per kilo at the opening of 1895 to $5 at present. The cause of the low price is competition, and there is no probability that the supply will diminish. The source of the cerium is the by-products of thorium manufacture, and the price of its nitrate is $50 per kilo. The bath for saturating the mantle is a 30 per cent aqueous solution of thorium and cerium nitrates in the proportion of 99 : 1.

Prof. Roentgen finds that the X-ray, traversing a slit in metal and impinging on the eye, can produce retinal fluorescence and an image of the slit. From this it may be inferred that by substituting a thin metal disc (having a radial slit) for the ordinary telegraph needle many afflicted with permanent blindness may read the Morse alphabet as read by telegraph operators in the ordinary way. The possible importance of this observation is obvious.

In his latest observations, just communicated to the Berlin Academy, Prof. Roentgen finds that the X-rays emanate from the irradiated air in all directions, so that if they were visible the appearance would be that of a room filled with smoke and lighted up by a candle. When a plate impervious to the rays is placed in front of a fluorescent screen the barium platinocyanide still remains luminous, but the fluorescence disappears when the screen is surrounded by a thin cylinder of lead. The observation that the rays may be made visible, presumably by causing fluorescence of the retina, is confirmed. Our present knowledge of X-rays may be summed up by saying that the rays from a discharging apparatus are a mixture varying in absorbability and intensity; that the composition depends chiefly on the duration of the discharging current; that different bodies absorb different kinds of rays, and that the X-rays are produced by the cathode rays and the phenomena of both are probably of the same nature.

The experiment of producing light from household refuse, now being tried for the first time at Shoreditch, a London suburb, will be noted with interest. The refuse is burned in twelve destructor cells, each having a grate area of 25 square feet, and each pair heating a water tube boiler, which works at a pressure of 200 pounds. Suitable engines use the steam for driving three high and three low tension electric generators. The destructors are operated throughout the twenty-four hours, but, as the power is chiefly required for light, heat is stored by day by warming water to feed the boilers at night. The destructors are designed to burn 20,000 tons of refuse per annum. It is estimated that this will furnish electric light and power and warm baths for the 124,000 inhabitants of Shoreditch.

From scientific experiments upon more than 2000 persons, Dr. J. H. Kellogg of Battle Creek, Mich., has determined the effects of one ounce of alcohol administered internally to be the following: (1) To diminish nerve activity; (2) to diminish cerebral activity; (3) to impair the co-ordinating power of the brain; (4) to lessen muscular strength; (5) to decrease digestive activity to a notable extent. Both his medical experience and laboratory research have convinced him that it is an error to regard alcohol as an aid to digestion, as it has proven highly detrimental. This influence upon the digestion, he declares, is exactly what would be expected of a drug that, like alcohol, is a paralyzer of protoplasmic activity, an anæsthetic and a sedative, and not, as has been erroneously supposed, a stimulant.

To make a new magnesium light magnesium is placed between thin impenetrable sheets of paper, which are coated with paste. They are then stuck together. After drying, a sheet of paper impregnated with potassium chlorate is placed on each side of the package. For an envelope, a wider sheet of paper is placed about the packet, so that the whole forms a thick leaf or pad of paper, which can be cut with a pair of scissors into strips. To produce the light one of the strips is held in tongs and ignited, when it burns with a brilliant magnesium light. The magnesium paper prepared in this way is claimed to be durable and entirely free from danger.

G. Spezia contributes to the *Atti* of the Turin Academy an investigation on the action of water on quartz under pressure. Pfaff has shown, using quartz powder, that at 18° and 290 atmospheres' pressure one part of quartz dissolved in 4700 parts of water; using plates of quartz, Spezia finds that 25° and 1750 atmospheres (in one experiment 1850 atmospheres) in the space of over five months absolutely no quartz went into solution.

Mechanical Progress.

New Reduction Method.

A patent has been granted to Hiram Maxim for improvements in processes and apparatus for reducing metals from their ores, and for obtaining carbides, acetylene, cyanogen, cyanides, nitrides, and for fixing nitrogen. The principle involved is that of subjecting the materials to be treated to the action of a gaseous heating medium, which derives its heat from ordinary combustion and the heat of electrical energy. If desirable, the electrical superheater can be made to revolve. The primary heater is a circular flue, fixed in a furnace heated by the combustion of solid or gaseous fuel. Leaving this furnace, the heated reaction gases pass through the electrical superheater, which consists of two vertical chambers, packed with carbon blocks, fireclay, or other suitable materials. These are heated to a very high temperature by the passage of the electric current introduced through poles at the top and bottom of the heater. The reaction gases passing over the same are heated to the required temperature, and are ready to pass to the small furnace of the blast furnace type which forms part of the plant. These heated gases are introduced through a tuyere at the bottom of the furnace, into the top of which the material to be acted on is fed through a hopper and worm. Any excess of the reaction gas and the gaseous products of the reaction escape by a pipe to a holder, and when of a suitable character are drawn from thence as gaseous fuel for the primary heater. The blast furnace is charged with lime, carbon and potash, magnesium, etc., according to the desired product. The reaction gases are also varied accordingly. Thus, to make illuminating gas and carbide, steam and hydrogen or a hydrocarbon are used, the oxygen of the steam forming CO, and the hydrogen combining with the electrically-heated carbon to form acetylene. For cyanogen compounds nitrogen is employed, or, in conjunction with air, used to form nitrides. For treating ores a reducing gas, such as carbon monoxide, is produced. In making calcium carbide limestone is used, and carbon in sufficient excess to convert the CO^2 as liberated.

Analysis of Smoke.

At this time, when strong efforts are being made to dispense with such volumes of smoke in our American cities, experiments made in the laboratories of Sibley college are especially interesting. These experiments show that the usual figures for dense smoke per ton of fuel employed ranged from ten to twelve pounds of soot; of the latter, about one-half was carbon, the remainder principally unconsumed hydrocarbons, 10 to 15 per cent of ash, and, if collected outside of the furnace, perhaps 2 per cent of moisture. It was found that no smoke was ever produced in an atmosphere of oxygen. With restricted air supply the maximum just stated was obtainable; but low temperature combustion and restricted oxygen supply appeared to be the two main conditions favoring smoke production. Again, the composition of soot was found often to be substantially that of the coal from which it was produced. A reduction of the proportion of smoke made effects a reduction correspondingly and perhaps proportionately in the percentage of carbon contained in the soot. Thus, coal used at St. Louis was found to contain 50 per cent carbon and 36 per cent hydrocarbon, while its smoke contained 25 per cent carbon and 10 per cent hrdrocarbons. Where no hydrocarbons exist smoke cannot be produced by any fuel.

Railway tracks are found to be not absolutely stationary, but to be moved slightly, especially on steep descents, through the influence of the traffic over them. Austrian and French engineers report that the left-hand rail, seen in the direction of running, moves forward more than the right-hand one, while Egyptian engineers have an opposite experience. One explanation is that the cranks on the right side lead on European locomotives, and those on the left on the locomotives of Egypt.

Everlasting Paste.

Dissolve a teaspoonful of alum in a quart of water; when cold, stir in as much flour as will give it the consistency of cream, carefully beating up all lumps. Stir in half a teaspoonful of powdered resin, and pour on this mixture a teacupful of boiling water, stirring well. When it becomes thick pour into an earthen jar, cover, and keep in a cool place. When needed for use, take some from the stock, and soften with warm water. Paste thus made has been known to keep in good condition for at least twelve months, and can be made more pleasant by adding oil of cloves.

Manjak is a mineral substance recently found in the island of Barbadoes, which is used as an intensifier of the illuminating power of coal gas. Its importance to the electrician, however, lies in the fact that it possesses many of the properties of an ideal insulator for electric wires. It is black in color, and has a high luster and a bright, conchoidal fracture, resembling in appearance newly broken pitch. It is found very near and sometimes upon the surface of the ground, in seams varying from 1 foot to 2 feet in thickness, running usually at an angle of about 45 degrees, and in close proximity to rocks. It is supposed to have been formed by the drying up and consolidation of petroleum oil, which is found in abundance in the same localities, and is often seen oozing out of the ground or floating down the streams. In composition it is not unlike Trinidad pitch, the Utah gilsonite and the Mexican albertite. The analysis of the best quality manjak is stated to be: moisture 2, volatile organic matter 70.85, non-volatile organic matter 26.97 and mineral matter .18.

Experimental pipe-driving through new stone-filled cribwork is described in a paper recently read by Professor W. H. Burr before the American Society of Civil Engineers. Nineteen piles, from 52 feet to 60 feet long, which were shod with chilled cast-iron points held on by straps spiked to the wood, were driven without difficulty with a hammer weighing 3500 pounds. The greatest number of blows was 350, and there were no failures. In the discussion that followed other gentlemen gave experiences in pile-driving through loose rock. The shoe used in the work of the New York department is conical, the angle of the cone being about sixty degrees. The base of the cone is flat, and it is secured to the cone by a pin cast as part of the shoe and let into the end of the pile. Practice has proved this type of a shoe very satisfactory.

The life of a locomotive is not as long as generally supposed. Investigations in this direction recently made in Germany show that the average locomotive has to be withdrawn from service after traveling about 500,000 miles. This does not include the time the locomotive is under her own steam without pulling a train. During the period a locomotive is in service a number of parts have to be repaired or renewed. For instance, the boiler and fire-box have to be renewed three times, the tires of the wheels five or six times, the driving cranks from three to five times. After a half-million miles of active service the average locomotive is no more worth repairing and is entirely withdrawn.

Belts made too tight will cause friction to such an extent that it will consume all the power of the engine. Under a given load, it is wonderful to see how much power of resistance is in a good belt. It can be strained for months, and after a short period of rest it will return to its original strength and length.

UNION IRON WORKS,

★ ★ 222 Market Street, San Francisco, Cal. ★ ★

MANUFACTURERS OF

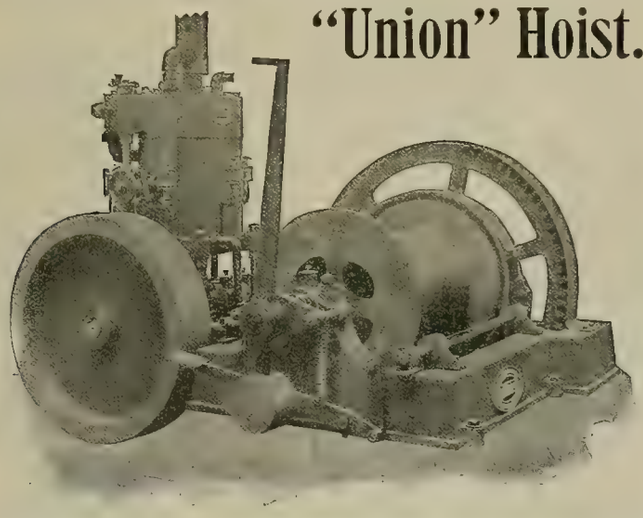
Mining & Milling Machinery,

Automatic Cut-Off Engines, High-Speed Engines, Hoisting Engines,
Quartz Mills, Manty Chili Mills,

PUMPS---CORNISH AND OTHER.

Rolls and Concentrating Machinery,
Copper and Lead Furnaces.

"Union" Hoist.



The above cut represents our 10 h. p. Double Cylinder Engine of latest type, and Hoist combined on strong iron base. This hoist is designed to raise one ton 125 feet per minute from an inclined shaft, or 1500 pounds at the same speed vertical lift. The drum will hold over 600 feet of ⅝-inch cable. The outfit weighs 3500 pounds.

THE UNION GAS ENGINE CO.

—BUILD THE—

"Union" Gas Engines,

Which use either Manufactured or Natural Gas, Ordinary Stove Gasoline (Naphtha or Benzine), Distillate or Kerosene.

STATIONARY ENGINES for All Kinds of Work, Built in Sizes from 3 to 200 h. p.
"UNION" COMBINED HOISTS in Sizes from 2 to 40 h. p.
"UNION" COMBINED COMPRESSORS—20, 30, 40 h. p.
HOISTS and COMPRESSORS Can Be Built in Larger Sizes to Order.
"UNION" MARINE ENGINES, 4 to 200 h. p., of Single, Double and Four-Cylinder Types.
TEN YEARS' EXPERIENCE Building Gas and Oil Engines.
"UNION" ENGINES Are In Use All Over the United States.
"UNION" ENGINES Are Simple, Durable and Economical.

Office: 314 HOWARD ST., SAN FRANCISCO, CAL.

Electrical Engineering Co.,

34-36 MAIN STREET,

SAN FRANCISCO, CAL.

Manufacturers of All Kinds of

Electric Machinery

For Mines, Mills and Hoists.

Girard Water Wheel Co.,

34-36 MAIN STREET,

SAN FRANCISCO, CAL.

These wheels are durable, highly efficient, and are the only wheels which have perfect regulation, which feature makes them especially suitable for the operation of electric machinery.

Coast Industrial Notes.

—To date about 6000 have started from coast ports to the Yukon placers.

—The salmon pack in the Columbia river, Or., for the season of 1897 is estimated at 430,000 cases.

—The San Francisco cable and steam roads operated by the Market-street system are to be run by electricity.

—Silver is on the rise again, but for the present at least wheat and silver seem at last to have parted company.

—The wages of the lumbermen and mill hands in Shasta county, Cal., have been reduced from 10 to 25 per cent.

—San Francisco has the credit of being the only outfitting point that didn't raise the price of supplies to Klondikers.

—The Japanese section hands on the Oregon Short Line have struck because of a reduction of wages from $1.25 to $1.10 per day.

—The Thirtieth Industrial Exposition of the Mechanics' Institute opens at the Mechanics' Pavilion in San Francisco on the 17th.

—In King county, Washington, 350 coal miners receiving 55 cents per ton mined, have struck for 3000 pounds to the car regardless of its contents.

—Creditors of the California Lumber Company have applied to have the corporation declared insolvent. The liabilities are stated to be $40,000.

—The Los Angeles, Cal., Iron and Steel Works, which till recently gave employment to nearly 300 men, are soon to be reopened, backed by English capital.

—The tug Fearless has gone to Nanaimo to coal up, preparatory to towing from Seattle to San Francisco the big dredger for use in deepening the approaches to Mare Island.

—The new tariff has put a duty on asphalt, in order to stimulate developments of deposits in this country, which will check importations from Trinidad and be a good thing for California and Utah producers.

—Sea otter schooner hunters on the Washington coast have done well this season, four having so far netted $03,000. The sea otters yearly grow scarcer and warier; good skins are now rated in London at $1000 each.

—The Southern California Electric Light and Power Company of Redlands, Cal., has contracted with the Los Angeles Street Railway Company for power for the latter's lines for twenty years; least annual payment, $50,000; maximum payment, $150,000.

—The Siberian railroad is making new business for the Coast lumber interests. The Glenturret, 3026 tons, net register, now at Shanghai, is chartered to load lumber and ties at Astoria, Or., for Vladivostock. A cargo was shipped from Port Blakeley, Wash., in July for Shanghai.

—During the past week fifteen carloads of machinery and material were shipped over the Pacific Coast Railway for Zaca for the new asphaltum company lately established in northern Santa Barbara county, Cal. It is estimated that there will be over 250 carloads to be taken there altogether.

—The steamer Mexico of the Pacific Coast Steamship Company, shortly after leaving Sitka, Alaska, on her return trip to San Francisco on August 5, struck a rock and sank, a total loss. The passengers and crew were all saved. The baggage, freight, etc., went down with the steamer.

—J. N. Chapman of San Francisco has a contract from U. S. Surveyor-General Green to survey 210 miles of the outside boundaries of the Yosemite National Park and to re-establish the lines of the Yosemite grant. The price, $25 per mile, includes the erection of cast-iron posts filled with cement for corners and with suitable marks cast in the posts.

—It is reported at Port Townsend, Wash., that the Southern Pacific Railroad Company has secured control of the Port Townsend Southern Railroad and will complete a line through to connect with the Southern Pacific at Portland. The Port Townsend Southern is built from that place south twenty-eight miles. The road would tap the most heavily timbered section of country in western Washington.

—The fastest Transpacific ocean trip was made this month by the Royal Mail steamship Empress of Japan on her last voyage from Vancouver to Yokohama, the time consumed being ten days, three hours and thirty-nine minutes. The distance covered was 4270 knots. Heretofore the quickest passage was made by the Pacific Mail steamship China from San Francisco to Yokohama, in ten days, eleven hours and forty-eight minutes.

—C. R. Lloyd at Los Angeles, Cal., proposes to utilize the water of Bear creek to supply electric power, and has acquired the water rights above the head works of the Southern California Power Company. A diverting dam is to be built on Bear creek and the water conveyed in flumes and tunnels and piped to the junction of Bear creek and the Santa Ana, where the power house will be built. San Francisco capital is interested in the project.

—F. Erickson, the contractor for the building of the Sierra Railway, says that in thirty days the cars will be running to Montezuma, in Tuolumne county. The road starts from Oakdale. "The track is now laid and the cars running to Crimea House, a distance of 32½ miles," he says, "and we are rushing the work along at a rate never equaled in California railroading. I think it will go eventually to the big trees in Calaveras county. It will then be 110 miles long."

—The Oregon Pacific Railroad Company passed out of existence last week. The affairs of the road in Oregon, the original jurisdiction, were closed about three years ago, and the only assets left of the railroad company is a fund of $23,000, the proceeds of the sale of a steamer, and a dozen parties claim this sum. The road was projected to run from Yaquina bay, Or., to Boise City, Idaho. One hundred and fifty miles from Yaquina bay east were actually constructed, which cost $12,000,000, every dollar of which the bondholders lost, as the road sold for $100,000 at auction—hardly enough to cover the court costs. The trouble was no harbor at Yaquina.

—At the Los Alamitos, Cal., beet sugar factory the beets delivered average 18¼ per cent sugar, the highest being 26 2-10 per cent. Twenty-one tons per acre, at an average price of $4.50 per ton, give $94.50 per acre. The factory handles 350 tons of beets per day. The beets after being dug and topped are delivered to the factory in wagons, which after passing from the scales are driven upon an elevated platform so adjusted as to dump the beets from the side of the wagon without unhitching the horses, almost automatically. From the bins into which the beets are dumped they are carried to the factory by means of a flume. The first process on arriving at the factory is a purely mechanical one, which is the washing. From the washer the beets are sliced into thin strips about two inches long called cossettes, and are then ready to have the sugar extracted, which is done in the diffusion battery, which consists of eleven cells which hold about two tons of cossettes each. When full, hot water is passed through the first cell and from that one to each of the others in succession, until all the saccharine juice is extracted. The refuse from this operation is called pulp, and is usually stored in silos and used later for feeding stock. From this point the process has to do with the juice containing the sugar only, which is now heated to a temperature very nearly boiling in an apparatus called a calorizator, after which it is treated with milk of lime; the lime forms precipitates and goes into combination with the sugar and non-sugar; then on the addition of carbon dioxide gas the lime in combination with the sugar is re-precipitated. These precipitates, which are now in the form of mechanical impurities, are removed from the juice by filter presses. The juice is then clarified and conducted to the evaporators, four in number, called the "quad effect," and under a vacuum it is concentrated to about one-fourth of its former bulk, when it has the appearance of a clear amber liquid, after wh ch it is conducted to the vacuum pan, where it is boiled to a grain, after leaving which it has the appearance of grains of granulated sugar in molasses; the molasses is then separated in the centrifugals, and the sugar is dried in what is called a granulator, it now being pure white granulated sugar, and is conducted through a spout to the lower floor, put in 100-pound bags, is weighed and conveyed to the warehouse ready to be shipped in carloads.

Recently Declared Mining Dividends.

Boston & Montana Co., $3 per share; payable August 20th. Total to date, $6,275,000.

Quincy M. Co., Mich., $4 per share; payable August 16th, being $800,000 since January 1, 1897, or $9,470,000 to date.

Kearsarge M. Co., Mich.; $1 per share.

Portland M. Co., Colorado; 1 cent per share, $30,000; payable to stockholders of record August 15th.

Anchoria-Leland, Colorado, 1 cent per share —$6000; payable Aug. 16th; the thirteenth of such dividends.

Moon-Anchor, Colorado, extra dividend, 1 cent per share, $6000; payable Aug. 12th.

Swansea M. Co., Utah, 5 cents per share; $5000; payable August 10.

Santa Rosalia, Mex., M. Co., 10 cents per share; payable Aug. 16th.

Champion M. Co., Cal., 25 cents per share; $8500; payable immediately.

SCIENTIFIC PRESS DEWEY, STRONG & CO. PATENTS PATENT AGENCY
330 MARKET ST. S.F.

Personal.

RUSSELL L. DUNN has returned to San Francisco from Placer county.

PROF. F. A. C. PERRINE of Stanford University is at Elberon, N. J.

W. J. MORRIS has taken a position as assistant assayer at the Selby Smelting Works.

W. B. FISHER of Grass Valley, Cal., succeeds Col. Ewing as general manager of the Diamond Hill property, Hassel, Montana.

CAPTAIN CARROLL, of Alaska fame, has resigned steamboating, and has gone to the Klondike to add another million to his wealth.

WM. WESTON has returned to Cripple Creek from the San Juan region in southwestern Colorado, where he went to report on the Poughkeepsie Basin.

EX-SENATOR DUBOIS of Idaho, Senator Cannon of Utah, Senator Pettigrew of South Dakota and Senator Mantle of Montana started this week to visit Japan and China.

H. C. HOOVER, whose technical articles in the MINING AND SCIENTIFIC PRESS have attracted considerable attention, has been appointed manager for Zewick, Moreing & Co., Coolgardie, Australia.

S. C. DUNHAM, statistical expert of the U. S. Department of Labor, has gone to the Klondike to ascertain economic conditions and prepare data for a bulletin, which the department proposes to issue March 1st, '98.

MR. C. C. BURGER has succeeded Mr. John E. Rothwell as superintendent of the new chlorination works of the Delano Mining & Milling Co. of Boulder, Col. Mr. Burger has recently been in charge of chlorination works in Idaho.

M. BAILLOUD, E. Bre'rault and Felix Gouin, French mining engineers, are at Bisbee, Arizona, examining the copper mines and works. The gentlemen are on a tour of investigation looking into the American methods of working ore and their various treatments.

DR. C. W. MCLEAN of Des Moines, Iowa, one of the Directors of the Alder Creek Gold Mining Co., Ltd., is here on business concerning his company, which is enlarging its mill in Placer county. The company operates mines in Nevada and Placer counties, and has just purchased the Van Avery mine, near Blue canyon. L. Balliet is the engineer in charge of the work.

AUG. J. BOWIE, the hydraulic mining engineer of San Francisco, and Alf. Tregidgo of Grass Valley left on the Humboldt last Tuesday for the Klondike. They are backed by considerable money and are empowered to make such quartz or placer properties as in their judgment warrant investment. They took a $6000 outfit and are "well fixed." Mr. Bowie proposes to be gone a year, and for that time is to be paid $25,000. On the same steamer went Fred Deetken, late superintendent of the Marguerite mine, Auburn, Cal., bound to the Klondike. Mr. Deetken represents a German syndicate, who pay all the expenses for a year, $1000 salary and an equal interest in claims that he may secure.

Recent California Mining Incorporations.

Harville M. Co.; W. A. and C. B. Titcomb, A. H. Breed, H. Hilp, H. K. Selby; capital stock, $200,000; $25 subscribed.

Victor M. Co., San Francisco; mining business in Alaska; L. Getz, J. Armstrong, D. L. Fulop, E. Boukofsky, R. Cohen; capital stock, $100,000; subscribed, $50.

Klondyke Prince M. Co., S. F.; L. C. Hyner, M. D. Young, C. J. Dreker, H. B. Denson, F. L. Owen; capital stock, $2,000,000; $2,000 subscribed.

Uranus M. Co., S. F.; F. R. Purinton, G. L. Brown, W. C. Kewin, E. J. Benedict, J. St. Denis; capital stock, $1,000,000; $100,000 subscribed.

Victoria Dredger Co., S. F.; M. Selig; L. Hagan, L. Enereti, R. W. M. Payne, C. F. Humphrey; capital stock, $100,000; $5,500 subscribed.

Indian Creek M. Co., Trinity county, Cal.; R. C. Hall, H. Duvergney, W. H. Radford, J. Bergez; capital stock, $60,000; $19,500 subscribed.

El Paso M. & E. Co., San Francisco; A. O. Tulin, E. Bind, L. Schenck, H. B. and F. T. Larsen; capital stock, $500,000; $300,000 subscribed.

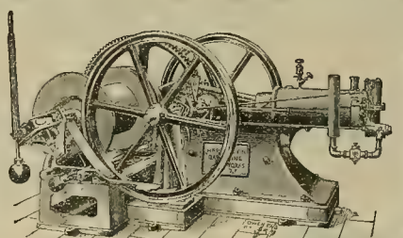
Slate Range Quartz M. Co. of San Bernardino Co.; San Jose; R. M. McCabe, J. R. Chace, J. Q. Robertson, W. Brotchie, J. K. Christie; capital stock, $100,000; subscribed $70,000.

Klondike Prince M. Co., S. F.; P. Hyner, M. H. Young, C. J. Decker, H. B. Denson, F. L. Owen; capital stock, $2,000,000; subscribed $2,000.

Klondike, Yukon, British Columbia Gold M. & Dev. Co., S. F.; F. F. Lord, F. W. Reade, J. E. Slinkey, R. V. Daniels, F. Bralich; capital stock, $250,000; subscribed $50,000.

British Columbia.
E. S. TOPPING, TRAIL, B. C.,
Has prospects for sale in Trail Creek and the whole of the Columbia basin. Will buy legitimate stock and mines for investors. Will examine mines. Has lots for sale in Trail and Deer Park.

Hercules Hoisting Engines



Solve the difficulty of fuel, and make mining profitable where steam power is too expensive. Over 3000 Hercules Gas and Gasoline Engines are in use, giving entire satisfaction. Fully guaranteed. Requires no engineer. No smoke, no dirt. No danger.

We build engines from 2 to 200 h. p. for pumping, hoisting, running air compressors, sinking shafts and for all power purposes. Used in mines throughout the coast.

Send for Catalog to HERCULES GAS ENGINE WORKS, 217 BAY ST. San Francisco, Cal.

California's 44th Annual State Fair
WILL BE HELD AT SACRAMENTO, . . .
TWO WEEKS. September 6th to 18th, 1897.

THIS ANNUAL EXHIBITION will embrace a complete representation of the Agricultural, Mechanical and Industrial possibilities of the State.
MECHANICAL DEVICES can be here shown to a better advantage, and, if meritorious, receive recognition of value in placing them on the market.
THE EXHIBIT OF PRODUCTS from lands offered for sale, gives both sellers and buyers an acceptable opportunity to meet.
THE LIVE STOCK DEPARTMENT is eagerly sought each season by buyers desiring to replenish their herds with stock of new blood lines. This is necessary and insures sales to all exhibitors.
THE POULTRY EXHIBIT will constitute a most important division of this year's exhibition, and will offer a most excellent chance for buyers to view the various breeds of fowls in comparison.
THE DAIRY DEPARTMENT will have a complete working exhibit showing the latest methods in dairying, and the working of improved appliances. Competent instructors from some of the leading creameries in the State will be in charge to give instructions to all in this growing industry.
ELECTRIC POWER, space and light will be furnished free to exhibitors.
GRAND MUSICAL CONCERTS will be held each evening at the Pavilion by the **California Exposition Band.**
THE RACING PROGRAMME will form one of the leading features of amusement, and usually attracts a large attendance that are of benefit to all exhibitors.
TO MANUFACTURERS AND DEALERS we say exhibit your goods and wares, meet the public on neutral ground and profit by advertising in a practical way. The public attends these exhibitions in vast numbers to be instructed as well as amused.
FREE TRANSPORTATION for exhibits and excursion rates will be given by the Southern Pacific Company on all their lines.
Address the Secretary for special information. Send for Premium Lists.

EDWIN F. SMITH, Secretary. C. M. CHASE, President.

GENERAL DRAWING OF BROWN'S STRAIGHT ROASTING FURNACE. HORACE F. BROWN M.E. 1607-8 MANHATTAN BLDG. CHICAGO ILL.

The Horace F. Brown Patent Straight Roasting Furnace.

A new form of mechanically stirred roasting furnaces is illustrated herewith. In cross-section it is the same as all of the furnaces built after or in imitation of the Horace F. Brown system of roasting furnaces, having the slotted wall construction for protecting the working mechanism.

The furnace shown is designed for sweet roasting a comparatively small amount of ore, and is well adapted for treating sulphide concentrates from stamp mills. The aim has been to secure the greatest possible efficiency with a minimum cost, both of construction and operation. For a furnace of this kind, having a roasting furnace not to exceed 12 feet wide and 60 feet in length, the fire boxes are placed below the roasting hearth and so arranged as to get the greatest heat at the point of discharge, with a minimum of fuel.

In roasting sulphide concentrates little or no fuel is required, except to break up the sulphate compounds that are formed, and for this purpose a high heat is required only at the finish. The ore discharges from the hearth, just in front of the fire box, to a suitable conveyor, that can be arranged so as to carry the hot ore over a water jacketed cooling floor or trough, the final discharge being at the tank or barrel where the ore is treated.

The carriage returns above the hearth in the same manner as in the Brown-O'Harra style of construction. The driving mechanism consists of two tables, and the carriage is driven from each end, forming a positive and powerful drive. The cables are operated by sprocket wheels mounted on suitable shafts at each end of the structure.

Where a greater length of hearth is required, or where the ore being treated lacks sufficient sulphur to be self-roasting, the heat is re-enforced by placing suitable fire boxes along the side of the furnace, as is done in the Brown horseshoe type or in the Brown-O'Harra.

For the past year a furnace built substantially as shown in the illustration has been in operation at the works of the Elliot's Metal Co., Wales, giving the most satisfactory results. The material under treatment at these works is what is known as "white metal," a very fusible compound and one that is difficult to handle, owing to its tendency to agglomerate, even with the most careful handling. This tendency to agglomerate and form accretions on the hearth is the frequent cause of putting a great strain on the rabbling carriage, but the double drive, as illustrated, has proved perfectly capable of withstanding the severest strains from this cause.

After so thorough a test, this construction of mechanically stirred reverberatory furnace is confidently offered to the metallurgical industry as one of the simplest and cheapest furnaces of its class, and admirably adapted for special classes of ore.

A complete automatic chlorination plant, which includes a furnace of the design shown, has recently been designed by the inventor for the Taylor mine, El Dorado Co., Cal., estimated to have a daily capacity of from ten to twelve tons.

Spadone's Concentrator Belts. Patented.

The "SPADONE" Curved Edge Concentrator Belt is attracting much attention among mining men, its merits appealing to the millman of practical experience.

Illustration (Fig. 1.) shows a cross-section, and (Fig. 2.) shows the edge flanging outwardly as it passes over the pulley. This relieves the strain from the top and bottom of the edge by directing the strain automatically to the inside face surface of the edges. Heretofore all belts have been so constructed that when they pass over the pulleys or rolls, a direct strain comes upon the top or at the base of the edges, causing the edges to break away from the body of the belts in a very short time. *We avoid this Mechanical Defect by our Spadone Curved Edge.* Belts made to fit any machine—4, 5 and 6 feet wide. Prices and samples on application.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us to give advice which will give inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address **DEWEY, STRONG & CO., Patent Agents. 330 Market St., San Francisco, Cal.**

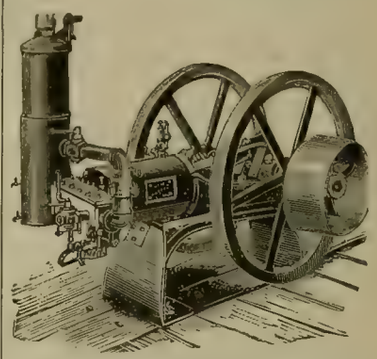
Cheap Power!



SAVE MONEY BY USING

—THE—

"DANIEL BEST" Crude Oil Engine.

This Engine can be operated on either Crude Oil Distillate, Gasoline, or Kerosene. **It is the cheapest power on earth** and is not tied to any one kind of Oil, but can use any kind that will make gas and is not handicapped by being compelled to use a certain Oil. Do not forget this when in need of an Engine.

We guarantee our Engines to work perfectly on California Crude Oil, or Distillate, or any other kind of gaseous Oil; we however prefer CALIFORNIA CRUDE OIL, from Coalinga, Fresno county, for the reason that gas from Crude Oil will produce more power from the number of feet of gas used than from any other Oil, and it is also a natural lubricant as well, the valves being always lubricated sufficiently to prevent them from sticking, thus assuring greater durability of the working parts than it otherwise would be in using dry gas. And another advantage we claim is, that danger from explosions is reduced to a minimum, there being no accumulation of gas, but is used by the Engine as fast as it is generated and hence is absolutely safe. The following is a test that we made with one of our Five-Horse Power Crude Oil Engines, running ten hours on the different gas oils:

California Crude Oil, 40 grav.,	7½ galls. at	5c.,	$.37½
Distillate.....40 "	7½ "	8c.,	.60
Domestic Coal Oil....40 "	7½ "	12½c.,	.93¾
Gasoline.....74 "	8¾ "	15c.,	1.31¼
City Gas.....1000 feet,			2.00

We manufacture all sizes from two-horse power up, and will guarantee that our Engines will run cheaper and are more simple in construction, have fewer parts and hence are more durable than any other Gas Engines on the market. Seeing is believing; don't take our word for it, but come and investigate for yourselves. You can always see one in operation at our works. We will be pleased to see you and will at all times take pleasure in showing them up. Our Engines are specially adapted for running well and mining machinery—in fact, for any kind of power desired. We are the pioneers and first inventors of Crude Oil and Distillate Engines. **We always lead and never follow.** Send for Catalogue and Price List of the only genuine Crude Oil and Distillate Engine made.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong&Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

GANG PLOW.—George W. DeWitt, San Ardo, Cal. No. 587,521. Dated Aug. 3, 1897. This invention relates to devices for adjusting and guiding gang plows of that class in which the plows are supported from a triangular framework having wheels near the angles and means for attaching the beam to the base of the triangular frame. The furrow wheel and the rear land wheel are journaled in standards so connected that one or both of them may be held rigidly to resist side thrust, or by turning them to an angle with the line of travel they will act to throw the plows to or from the land and thus regulate the cut. The wheels and their standards are turned by means of horizontally disposed levers and holding racks, and by means of vertically movable levers the wheels and their standards may be raised or depressed to regulate the depth of the cut.

WASHING MACHINE.—Lafayette Ryder, Woodland, Cal. No. 587,510. Dated Aug. 3, 1897. This invention relates to improvements in machines for washing clothes. It consists of a stationary tub having the central portion of the bottom concaved or segmental, a shaft journaled across the tub in the axis of this concavity having a hub secured to it, two sets of arms fixed to the hub diverging from one end outwardly so as to form an enclosed space between them, the arms of one set being fixed to stand out of line with those of the other set. In the bottom of the tub are removable blocks having pressure bars secured to them standing essentially radial from the oscillating shaft, and so arranged that the bars of one side are out of line with those of the opposite side. These bars and the arms upon the oscillating shaft are so arranged with relation to each other that one set of arms will pass between the adjacent bars when moved in that direction and the other set will move in line with the bars by the tilting of the shaft so as to compress the clothing between the arms and bars. When the shaft is oscillated in the opposite direction the clothing is carried over to that side by the arms which are behind it, the arms upon the opposite side passing out between the fixed radial bars and allowing the bars behind the clothing to again compress it against the arms upon the side toward which the bars are approaching. This alternate operation soon squeezes the dirt out of the clothes.

SAFETY GUARD AND FENDER FOR CARS.—George Glennie and Ralph Boone, San Francisco, Cal. No. 587,524. Dated Aug. 3, 1897. This invention relates to an improved safety guard or fender which is especially designed for use upon street railways or other cars to prevent their running over people or obstructions. It consists essentially of a horizontally movable spring-actuated fender frame adapted to be projected to the front from its normal position in line with the front of the car, a receiving surface carried thereon, vertical guides with a vertically moving flexible apron traveling between them, a roller situated above the fender frame at its junction with the fender whereon the apron may be coiled, means by which the two surfaces are projected at right angles with each other by the forward movement of the fender frame, flexible chains or cords passing over guide pulleys, the upper ends of said chains being connected with the upper ends of the vertically movable apron and the lower ends with the fender frame so that the movement of the latter is communicated to the apron. A suitable trigger and trigger frame serve to hold the fender retracted under ordinary conditions; but whenever it strikes an object it will be immediately released and forced to the front by actuating springs, the vertical fender being also moved upwardly to screen the front portion of the car.

GOLD IN COLORADO!
Colorado has within its limits some of the greatest gold mines that has ever been discovered. In Cripple Creek in 1892 there were a few prospectors looking over the hills; in 1895 the camp turned out over $8,000,000 in gold. Leadville, the old bonanza camp and the mineral product of which made Denver what it is to-day, is becoming a big producer of gold. New inventions for working low-grade gold ores, together with the discoveries made to work rebellious ores, have opened up a field for the miners such as they have never enjoyed before, and Colorado has inducements to offer such as no other district in the world possesses; the record of the State in gold production for the last three years speaks for itself. Among the other prominent camps in the State are Telluride, Ophir, Rico, Silverton, Mineral Point, Durango, La Plata, Ouray, Saw Pit, Ironton, the Gunnison district and many others. New finds are being made and new camps are springing into existence every day. The Denver & Rio Grande Railroad, which is the pioneer road of Colorado and which has always been the miner's friend, reaches all the mining camps in Colorado. For elegantly illustrated descriptive books, free, of mines in Colorado send to

Assaying Gold
AND
Silver Ores.
By C. H. AARON.
A Standard Work.
This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the pratical miner can mistake his meaning.
The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores,") that have been "successfully popular," is written in a condensed form, which renders his information more readily available than that of more wordy writers. The want of such a work has long been felt. It will be very desirable in the hands of many.
Table of Contents:—Perface: Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assay: Examples of cupellation; Weighing of Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests of Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.
The volume embraces 126 12-mo pages, with illustrations, well bound in cloth; 1896. Price $1.00 postpaid. Sold by the Mining and Scientific Press, 330 Market St., San Francisco.

THE BEST BOOKS

Are always the **CHEAPEST.** All the latest and best works on **Mining, Metallurgical, Electrical and kindred subjects** can always be obtained through the office of the MINING AND SCIENTIFIC PRESS. Below will be found a list of standard books in their various lines. If you do not find what you want in it, send for catalogue and price list of **Standard Mining Works and Scientific Publications.**

MINING AND SCIENTIFIC PRESS,
330 Market Street..... San Francisco, Cal.

Assaying.—Part I—Gold and Silver Ores.
Third edition; Just Out. Rewritten and Improved by the Author, C. H. Aaron. Embraces 130 12-mo pages, with illustrations; well bound in cloth; 1896. Price, postpaid.....$1 00

Assaying.—Parts II & III—Gold and Silver Bullion, Lead, Copper, Tin, Etc.
Latest edition. Contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter. Price, postpaid.....$1 75

Notes on Assaying and Assay Schemes.
By P. De Peyster Ricketts, E. M., Ph. D., Professor in Assaying in the School of Mines, Columbia College, N. Y. Prepared with special reference to the wants of the student and practical assayer. Containing also Rules for the Examination of Mines, Assayer's Outfit, Treatment of Ores, etc. Fifteenth edition. 8vo., cloth.....$3 00

Prospector's Field Book and Guide.
By H. S. Osborn.....$1 50

A Practical Guide for Prospectors and Miners.
By C. W. Moore. With numerous illustrations.....$4 75

Roasting of Gold and Silver Ores and the Extraction of their Respective Metals Without Quicksilver.
Second edition. By Guido Kustel, M. E. Contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. Price, postpaid.....$3 00

The Lixiviation of Silver Ores with Hyposulphite Solutions.
With special reference to the Russell Process. Second edition. Completely revised. By Carl A. Stetefeldt. Price, bound in cloth.....$5 00

Modern Copper Smelting.
By Edward Dyer Peters, Jr. Seventh edition. Rewritten and enlarged. Profusely illustrated....$5 00

Electricity in Mining.
By Sylvanus P. Thompson.....80 cts.

Practical Treatise on Hydraulic Mining.
By Aug. J. Bowie, Jr. On the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on heavy grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc Price, postpaid.....$5 00

Practical Hydraulics.
A book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers and Irrigators. By P. M. Randall. Contains useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulæ, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules and tables are prepared. Is specially applicable to the Pacific Coast. Price, postpaid, $2

The Metallurgy of Silver.
By M. Eissler. Profusely illustrated.....$4 00

The Explorer's and Assayers' Companion.
A third edition of selected portions of the "Explorer's, Miner's and Metallurgist's Companion." By J. S. Phillips, M. E. A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying and Metallurgy. Price, postpaid.....$6 00

Aaron's Leaching Gold and Silver Ores.
By C. H. Aaron. The most complete handbook on the subject extant; 164 pages, octavo. Illustrated by twelve lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, postpaid.....$3 00

Manual of Assaying—Gold, Silver, Copper and Lead Ores.
By Walter Lee Brown, B. Sc. One colored plate; 132 illustrations on wood. Fifth edition. 12 mo. 533 pp. Price, postpaid.....$2 50

The Metallurgy of Gold.
By M. Eissler. Profusely illustrated.....$5 00

A Text Book of Mineralogy.
Based upon the System of Mineralogy of Prof. J. D. Dana. Embracing an extended Treatise on Crystallography and Physical Mineralogy. By Edw. S. Dana, Curator of Mineralogy, Yale College. With upward of 800 woodcuts and one colored plate. Seventeenth edition. 8vo., cloth.....$3 50

Notes on the Treatment of Gold Ores.
By Florence O'Driscoll, Associate Member of Institute of Civil Engineers. 8vo., cloth.....$2 00

A Practical Manual of Minerals, Mines and Mining.
By H. S. Osborn.....$4 50

Cyanide Processes for Gold and Silver Ores.
By E. B. Wilson, E. M. 12mo., cloth.....$1 50

Practical Metallurgy and Assaying.
By A. H. Hiorns.....$1 50

The Practical Metal Worker's Assistant.
By Oliver Byrne. Illustrated.....$5 00

Quartz Operator's Handbook.
By P. M. Randall.....$2 00

Assayer's Guide.
By Oscar M. Lieber.....$1 50

Assayer's Manual.
By Bruno Kerl. Illustrated.....$3 00

Metallurgy of Silver, Gold and Mercury in the United States.
Showing the latest practice pursued in American Metallurgical Establishments. With 186 engravings and folding plates, tables, etc. By Prof. Thos. Egleston, School of Mines, Columbia College. With corrections. Vol. I.—SILVER. 8vo.....$7 00

Metallurgy of Silver, Gold and Mercury—Continued.
Vol. II.—GOLD, MERCURY, Etc. Illustrated with 140 engravings and folding plates; 935 pages, 8vo., cloth.....$7 50

Manual of Determinative Mineralogy.
With an Introduction on Blow-Pipe Analysis (constituting the Determinative Part of Dana's Mineralogy). By Prof. Geo. J. Brush. Thirteenth edition, translated into the new system. 8vo., cloth...$3 50

Skeleton Mining Report.
Of great practical value to miners and mine owners in making a comprehensive report on mining properties. Useful and convenient to mining engineers as a field notebook. Price, postpaid....50 cts.

Stamp Milling of Gold Ores.
By T. A. Rickards, M. E. An actual record of milling practice in this and other countries. Deals with the erection and management of mills, and contains many helpful suggestions to those interested in the extraction of gold from its ores. Well illustrated. Cloth. Price, postpaid.....$2 50

FINCH & CAMPBELL, GENERAL MANAGERS. WALLACE, IDAHO, June 18, 1897.

The Mine and Smelter Supply Co., Denver, Colo.—GENTLEMEN: Replying to your favor of the 8th inst., regarding my experience with the "Wilfley Concentrating Table," will state that in February last I placed in the vanner room of the Standard mill one of your tables, which has been in constant use every day since. It has been operated by the usual attendant of the vanners and has been given no special attention, and has been supplied with the same "feed" as the Frue vanners and at the end of each day's run has shown lower tailings than the vanners and produced from three to four times the quantity of concentrates of the same value per ton as any of the Frues. We have three more of the Wilfleys in the same mill, which are all doing splendid work and handling fully twenty tons each per day of siliceous ore carrying about 10 per cent lead and 12 ounces silver. They are all making a remarkably close saving of values and giving the most perfect satisfaction. A very fair opportunity is offered in this mill for comparing the work of different concentrators, as we are using Harz jigs, Collom jigs, round buddles, Frue vanners, and Wilfley tables, and handling nearly 500 tons of crude ore per day, and all of the machines are given the class of work for which they are best adapted. I can heartily recommend the Wilfley to any one needing a concentrator for fine ores.

Yours very truly, EMERSON GEE, Manager Standard Mining Co.

These Tables have displaced belt tables of almost every make, as is shown by letters in our possession.

PRICE, $450.00.

Why the Springer Concentrator is the Best:

It will do more and cleaner work than any rubber belt machine.
It weighs only one-half as much as some of the six-foot concentrators.
Is the most simple in its construction of any machine in the market, and only one-third as many pieces in i as in some of the others. Was invented by an old miner of forty years' experience handling every known concentrator on the market.
Should any piece need repairing, it can be removed without disturbing any other part of the machine.
Can be set up by any inexperienced miner.
Its distributor is perfection itself, distributing the pulp evenly over the entire surface of the belt.
Grade of shaking frame can be changed while the machine is running at full speed.
It is the strongest, lightest running and most inexpensive to keep in repair of any
Will save more of the fine slimes than any other machine.
Is cheaper than any other six-foot machine, costing only $350.00 f. o. b. cars or boat, San Francisco.
Will handle the pulp from five stamps better than any other Concentrator.
Has adjustable eccentrics, and any length of stroke can be had, thereby giving different speeds per minute.
The belt is very durable, being made of No. 3 Canvas, woven especially for the Springer concentrator.
This machine requires so little attention that one man will easily attend to a dozen of them.
It has a solid rubber flange, which no other canvas belt has.
Wear and tear upon this machine is not one-third as much as upon some of the other concentrators

Market Reports.

The Markets.

SAN FRANCISCO, Aug. 12, 1897.

The call for shipments to Alaska is decreasing, although there are some fairly free shipments going forward, but the demand from points in this State and other Pacific slope points is steadily enlarging and will continue to until the bulk of fall stocks has been laid in. The merchants, both jobbers and retailers, are disposed to buy in larger quantities. This is due partly to a larger consumptive demand owing to increased population, but to growing confidence can be more directly attributed the disposition to buy more freely. This feeling of confidence is traceable to higher prices for the chief products of the farm and a decided improvement in the speculative markets at the East. These latter are generally a true index to the general situation. The only thing to be feared now is that overtrading in speculative securities and commodities which may lead to a collapse before a revival has hardly begun. This opinion is based on information from the East that the public have taken hold of speculative markets and are carrying prices up, allowing moneyed pools to unload at good round profits on original investments. The cheap money markets with heavy supplies of idle money are favorable to the long buyers, for accommodations can be obtained readily for carrying larger quantities. This continued excitement regarding the Klondike mines and reported discoveries of richer gold deposits in different parts of the coast are doing a good deal on this coast in promoting a more cheerful and confident feeling.

The local money market continues to work easy, with more outside capital offering. The increasing output of the gold mines is playing quite an important part in promoting a more general ease. In the month of July, Selby Smelting and Lead Company refined over $2,500,000 in gold bullion. This is the largest refining in any single month in the history of the company. The heavy disbursements that are being made for grain, breadstuff, canned salmon and fruits, dried fruits, etc., etc., are also being favorably felt. The farmers that sell at present prices for wheat will be able to cancel in whole or in part their mortgage indebtedness, which will add still larger sums of money to the banks' available surplus funds. Exchange in New York is lower and weak at the decline, which indicates that heavy shipments of produce are being made to the East. The East reports active and stiffening money markets.

New York Silver Prices.

NEW YORK, August 12.—Following are the closing prices for the week:

	Silver in— London.	N. Y.
Friday	25¾	56
Saturday	26	56⅜
Monday	25 15-16	56¼
Tuesday	25⅝	55⅝
Wednesday	25⅝	55½
Thursday	25¾	55¼

	Copper.	Lead.	Iron.	Tin.
Fri.	10 87½@11 15	3 75	9 00@12 00	13 70
Sat.	10 87½@11 15	3 70	9 00@12 00	13 65
Mon.	10 87½@11 15	3 70	9 00@12 00	13 70
Tue.	11 00 @11 25	3 65	9 00@12 00	13 80

London Bankers' 60 days	$4.87
London Merchants	$4.85
London Sight Bankers	$4.88
Refined Silver, per oz., 1000 fine	55¾
Mexican Dollars	45½@46

SILVER.—The market advanced Friday and Saturday, but on Monday there was a weaker tone with lower sales reported, which led to a break the next day of ⅞ cents. Since then the market has been gaining in strength. It is quite impossible to get at the true position without largely theorizing. The famine in parts of India caused the natives to part with their silver hoarding, and as there was not much demand from China this silver went to the parts of India not so much affected by the drouth, which cut off just so much of the requirements. Japan being out of the market, with other countries not taking much to keep up their silver currency, helped also in promoting the decline. At the lower prices many high cost mines have shut down.

MEXICAN DOLLARS.—The market is more or less unsettled, with quotations largely nominal, although ours cover the cost of silver minting and carriage, with silver bullion quoted at 55¾ cents per ounce fine.

QUICKSILVER.—The market is weaker and lower. The drop in silver is said to have an unfavorable influence on the market owing to shutting down of many high cost mines and lessening the output of others. It is silver mining that consumes so much quicksilver. Besides this, in glass-plating the cheaper silver gets the more that is used at the expense of quicksilver.

Our market is quoted at $88 for domestic consumption.

COPPER.—The market has firmed up under a continued improving consumption in this country and large exports to Europe. The low price of silver takes off some of the profits for copper mining.

In their last circular, D. Houston & Co., New York, report as follows: "We have been passing through a period of curtailed manufacture and limited consumption in this country, but when domestic requirements reach the normal point again we may expect a natural and decided rebound from former depression. Trade outlets should expand, and domestic demand increase from this time forward; and when home consumption becomes active, in conjunction with the heavy foreign demand, we may look for a rapid appreciation of market values. Stocks are being depleted, and deliveries are behind on certain grades as it is. Foreign advices show that consumption abroad continues large, in fact considerably larger than last year, when European demand exceeded anything previously. A labor strike among the engineering trade in England of recent occurrence was responsible for a drop in the London market. Two cargoes of Bolco and Mason's copper by their arrival increased the mid-monthly European copper statistics by being included in the stocks. All this copper is sold and goes to the smelters.

Our market is quoted as follows:

Ingot casting, jobbing	13@—
Ingot " wholesale	12½@—
Sheet copper	—@16½
Bolt	¼ and 5-16, 20c; ⅜ and larger, 16½

TIN.—The market is strong for both pig and plate. Shipments of plate are being made from the East to Europe, which, like shipment of pig iron from the Atlantic seaboard for Europe, will increase in volume and importance.

The market is quoted in jobbing lots as follows:

Pig, per lb., jobbing	—@ 15
Plate, I C coke, heavy, per box	$4 10@4 25
" " " light, "	4 00@—

LEAD.—The market was held to fairly firm prices throughout the week.

Our market is quoted in jobbing lots as follows per pound:

Pig	—	@	4 80
Bar	5 00	@	5 25
Sheet	—	@	6 25
Pipe	5 25	@	5 50

SHOT.—The market is steady.

Our market is quoted as follows:

Drop, sizes smaller than B, per bag of 25 lbs			$1 35
Drop, B and larger sizes,	"	"	1 60
Buck, Balls and Chilled, do,	"	"	1 60

POWDER.—The market is steady and active.

The market is quoted as follows for Hercules: No. 1, from 11¾c to 17½c, according to strength and quantity; No. 2, from 9c to 11c, according to strength and quantity.

IRON.—The weakness reported at the East is disappearing, owing to a belief that the coal strike will be over soon. The high rates of freights to Europe are still against some grades of pig sent abroad.

COAL.—The market is steady to firm. Advices of higher charters at Australia are in favor of sellers here. The demand for all grades is increasing.

COKE.—The market is quoted as follows:

Gas Companies'	— —		— —
English, to load	9 50	@	— —
" spot, in bulk	10 00	@	— —
" in sacks	11 00	@	12 00
Cumberland	— —	@	— —

ANTIMONY.—The market is steady.

Our market is quoted at 8¾c in a jobbing way. New York mail advices quote 7¾c for Cookson's, 7¼c for Hallett's and 7c for Japanese.

NAILS.—The market is lower.

Wire, carloads, basis per keg			....
" jobbing, " "			$2 10
Cut, carloads, " "			....
" jobbing, " "			2 00

BORAX.—The market is steady.

The market is quoted as follows:

Refined, in carload lots, in barrels	5
Refined, in carload lots in sacks	4¾
Powdered, in car lots	5
Concentrated, "	4½

PLATINUM.—The market is quiet.

Our market is quoted in a jobbing way at $15 per ounce and for scrap $10 an ounce.

ZINC.—The market is steady.

Our market is quoted at 10 to 15 cents, according to thickness.

ALUMINUM.—The market is steady.

We quote in jobbing lots at 45 to 50 cents per pound for ingots.

Chemicals.

Notwithstanding the new tariff increasing duty on several lines is in effect, still the market does not respond, and what is more, it is not expected to move up any until present stocks are exhausted. The East reports that importers have advanced prices slightly on every line affected by the tariff, but from second and third hands the goods can be had at the old prices, and as they carry liberal stocks, it looks as if it will be some time before jobbing prices are higher.

SULPHURIC ACID.—The demand is fair We quote in a jobbing way at 1¾c per lb for 66%.

ACETIC ACID.—The market is firm at 6 to 12c per pound from store for carboys, according to make.

NITRIC ACID.—Our market is reported steady from store at 6½@7c per pound in carboys.

BLUE VITRIOL.—Our market is firm.

We quote in a jobbing way at 4½c per pound.

SPELTER.—The market is steady.

We quote our market in a jobbing way at 5 cents a pound.

BISMUTH.—The market is firm.

Our market is quoted in a jobbing way at $1.50 a pound.

BONEASH.—The demand is good.

Our market is quoted in a jobbing way as follows: Extra, 4c a pound; No. 1, 3½c; No. 2, 2½c.

PHOSPHORUS.—The market is firm.

We quote in a jobbing way at 70 to 75 cents per pound.

SODA ASH, 58% (LeBlanc process).—The market is firm at $1.55 per 100 lbs. in a jobbing way.

CAUSTIC SODA, 60%.—The market is firm at 3c per pound in a jobbing way.

HYPOSULPHATE OF SODA.—There is a fair demand at 2½c a pound from stores.

NITRATE OF SODA.—Market is stronger.

Our market is quoted from store at 4c for 95%.

The Roessler & Hasslacher Chemical Company review the changes in some products brought by the new Tariff, which became a law on July 24th, as follows:

Benzoic Acid remains on the Free List.

Carbonate of Ammonia has a fixed rate of 1½c per lb., against 20%, an increase of about ½c per lb.

Carbonate of Potash is on the Free List; with the old Tariff a duty of 25% was exacted, a reduction in price averaging ¾c per lb.

Chloral Hydrate has a fixed rate of 55c per lb. against 25% old rate, making an increase ranging between 40c and 45c per lb.

Chloride of Zinc remains with increase; fused, 2-5c per lb.; granulated, 1-5c per lb.

Caustic Potash remains on the Free List; no change.

Cyanide of Potassium has been reduced in rate of duty, but selling prices remain unchanged, on account of the higher rate of duty on the raw material, Yellow Prussiate of Potash.

Hydrochinon at 20% duty against duty free brings an increase equivalent to about 35c per lb.

Hyposulphite of Soda—The duty is a specific one of ½c per lb., an increase of more than ¼c per lb.

Naphtole, Beta remains on the Free List; no change.

Oxalic Acid remains on the Free List.

Yellow Prussiate of Potash now pays a specific rate of 4c per lb., which is about 1 2-5c per lb. higher than the old rate. The market price has taken the benefit of this change gradually.

Red Prussiate of Potash has the fixed rate of 8c per lb., an increase of 1¾c per lb.

Sal Ammoniac, granular, now pays specific rate ¾c per lb., an increase of 35-100c per lb.

Salicylic Acid has been advanced from duty free to 10c per lb.

Sulphate of Alumina has been increased 1-10c per lb.

Sulphate of Zinc has been advanced from 25% ad valorem to a specific duty of 1c per lb., an increase of almost 4-5c per lb.

Sulphide of Sodium has been advanced to ½c per lb., an increase in duty of 3-10c per lb.

Zinc Dust is being rated at 1½c per lb., against 1c per lb. of the old Tariff, ½c per lb. increase.

In our market the tone seems to be stronger, but owing to liberal supplies in jobbers' hands, an advance cannot be established. It will be only a question of a short time before better prices will rule, particularly as the East begins to show signs of strengthening in both first and second hands.

Mining Share Market.

SAN FRANCISCO, August 12, 1897.

The market has been spasmodically active the past week, with no material changes in the low prices current with the preceding week. The market price for quite a number is so low as to make them attractive for the general run of operators, regardless of reports from or work in the mines. It has been the history of the Comstock, and will continue to be so long as the shares are a gamble, that when prices go down to low figures they are a buy, for sooner or later they recover and leave a good margin of profit to investors not buoyed up by visions of a great big deal at hand. In buying it is always well to keep within conservative lines, for one or more assessments may have to be paid before there is much of a move. The cry on the street is: "If only ore can be found." This cry, it is needless to say, is put out by persons interested in a freeze-out game, and is invariably raised before a deal and when the market is low. Insiders are noted for not giving their business away until they are positively sure that everything is so arranged that they can carry to success what is contemplated. At this writing the general business and financial interests of the country are favorable for a large speculative movement in Comstock shares; for the people are ripe for a gamble, business is improving, money is more active and speculation at the East increasing; but whether the moneyed inside pool is ready for a bull campaign it is hard to say. It is reasonably certain they will not make one unless shares are well concentrated, for with large holdings, not by chippers and chronic traders, by the outside, it would take a very large sum of money to stand under the market, so as to take the shares thrown on it at advancing prices. There is nothing, so far as we can learn, to warrant asserting that a movement for a big move is under contemplation, only enough to keep interest in the game and induce the paying of assessments.

The following mining companies report having had money on hand August 1, 1897, with July expenses paid: Andes, $2008.08; †Alta, 172.07; Bullion, $2644.11; *Caledonia, $1381.21; *Chollar, $7075.33 in cash, unsold bullion at the Mint valued at $6333.41 and a clean-up shipment of bullion to be received; *Confidence, $2877.43; Con. New York, $201.70; *Challenge Consolidated, $2876.35; *Consolidated Imperial, $2143.57; Crown Point, $446.81; Exchequer, $1127.46; Gould & Curry, $3950.27; Julia Consolidated, $663.99; Morgan, $1356.46; Ophir, $61.88; *Overman, $5755.65; Potosi, $1753.78; Savage, $1244.74; Segregated Belcher, $735.39; Sierra Nevada, $2516.27; Standard Con., $21,452; Syndicate, $882.02; Union Consolidated, $11,176.25; Utah Consolidated, $213.72.

*July expenses unpaid. †July expenses partly paid.

The following mining companies report having had an indebtedness August 1, 1897, with July expenses paid: Alpha Consolidated, $882.07; *Best & Belcher, due bank, $3500, less $641.77 cash on hand; †Belcher, $3933.65; Consolidated California and Virginia, due bank $26,000; Hale & Norcross, $2475.78; Lady Washington, $2000; Mexican, due bank $500, less $127.11 cash on hand; Occidental Consolidated, due bank $2500, less $280.07 cash on hand.

*July expenses unpaid. †July expenses partly paid.

Reports from the Comstock mines continue about as heretofore. Strikes of ore are losing interest, for when there is ore the shares go down, leaving the longs with assessments to pay, for during the past few years ore taken out does not cover expenses. Whether the reports of Flood and others visiting the mines will put ore in one or more remains to be seen. Some persons who visit mines now-a-days might possibly tell the difference between a horse in the mine and a truck horse. It is money down here to back up a proposition at Virginia City is what is wanted, and, until this comes forward, shares will sell—unless to make shorts fill and to sell a few shares long—only on merit and a fair percentage for prospects of finding something of value. The letter from Utah is about the same as published last week. In Sierra Nevada they have extracted from the main north drift thirty tons of ore, assaying about $24. In the winze low grade ore is found. Evidently there

JAMES A. POLLOCK, Mining Stock Broker,
SALT LAKE CITY, UTAH.

are too many shares out and not enough shorts to find much ore. In Union they are still working on the 900-foot level, with no change reported. In Mexican, No. 1 east crossdrift is showing clay seams. They are not likely to show much ore, unless too many short sellers should get on the market. It is west where the work would be more interesting. In Ophir the west crossdrift Central Tunnel has improved, for the ore is said to assay $2 a ton, which is double former assays. This may help to collect assessments. The work on the 1000-foot level is unchanged, being confined, so far as the public know, to the west crossdrift. In Con. Virginia, on the 1000-foot level, the west crossdrift got into quartz assaying 50 cents. The east crossdrift on the 1550-foot level is also in 50-cent rock, as is one part of work on the 1650-foot level. At another point on the latter level they extracted seven tons of $18.50 ore. The work in Best & Belcher and Gould & Curry is practically unchanged. In Savage they are working south on the 500-foot level. No work in Hale & Norcross or Chollar. It is singular that the shares of the former are called on the exchanges, for no one knows who has a right to issue them, and will not until the lawsuit is settled. In Potosi they are working both north and south on the upper levels. On the 550-foot level, jointly with Chollar, they are repairing the drain tunnel, while on the 750-foot level they are driving west. From Bullion nothing new comes to hand. The same remarks apply to Alpha, although they are stoping on the latter. There is nothing new to report from Con. Imperial, Confidence or Challenge. No news is allowed to leak out from the work that is being done in Yellow Jacket. The joint southwest enlarged drift of Yellow Jacket, Crown Point and Kentuck is out about 900 feet. They are drifting southwest on the 800-foot level in Crown Point. The quartz is low grade, going about $5 to the ton. In Belcher more active work is being done, as also in Seg. Belcher, but nothing new is reported. In Overman work is continued on the 900-foot level.

From the Brunswick lode nothing of importance is reported in official letters on file. The joint work of Gould and Curry, Best & Belcher and Con. Virginia is practically the same as given in last week's issue. In Occidental work is confined to the 550-foot and 650-foot levels. Nothing new is reported.

Standard Con. reports a net profit last month of $10,000.

The following illustrates the changes of the week:

ANNUAL MEETING.—The Regular Annual Meeting of the stockholders of the Marguerite Gold Mining and Milling Company will be held at the office of the company, No. 327 Twelfth Street, San Francisco, California, on MONDAY, the 23rd day of August, 1897, at the hour of 8 o'clock P. M., for the purpose of electing a Board of Directors to serve for the ensuing year, and the transaction of such other business as may come before the meeting. Transfer books will close on Saturday, August 21st, at 2 P. M.

F. METTMANN, Secretary.

Commercial Paragraphs.

E. BENNER of the Union Iron Works has completed the installation at the Diamond Hill mine, Montana, of an unusually large mining plant, reported to be the most complete in that section.

THE Colorado Iron Works Co. of Denver, Colo., have shipped the Sunnyside mine, Eureka, Colo., a carload of tramway material, and the Arkansas Valley Smelter Co., Leadville, Colo., a carload of water jackets for smelter, and two large elliptical bowl slag trucks.

THE Denver Engineering Works of Denver, Col., last week shipped to the Esperanza Mining Company of El Oro, Mexico, one of their patent mine timber framing machines, which cuts the tenons on mine timbers round or square, cutting both ends at one operation any size up to 16 inches in diameter and 10 feet long between shoulders. The machine can be operated by one man and a boy, and it is said will do the work of 22 men in getting out mine timbers. The Denver Engineering Works are also building a 100-ton crushing and concentrating mill for the Yellowstone Mining Company.

Books Received.

The Stone Industry in '96: An extract from the 18th annual report of the survey of 1896-97, Mineral Resources of the United States, calendar year 1896; David T. Day, chief of division of mineral resources. Carefully prepared and of equal value with the admirable reports of this branch of the Government service, giving correct, up-to-date statistics of the stone industry of the country. The aggregate value of different kinds of stone produced in the United States in '96 was $31,346,171, California's quota being $371,015, of which $215,883 was for granite. The statistics show a general falling off, but not to the extent noticeable in other industries during the long-continued depression.

Mr. A. S. Hallidie of the California Wire Works has issued a concise pamphlet—the Dingley tariff—in its entirety, handy for reference.

FOR SALE CHEAP.

Machine for Making Slat Fence.

Good opportunity. CALIFORNIA WIRE WORKS, 330 Market Street, Corner Battery, San Francisco.

FOR SALE CHEAP.

MAIT'S MAKE.
Capacity, 8 Tons Per Day.

Good order. Can be carried anywhere by prospector.

Address T. L., this office.

Valuable Silver and Lead Mining Property for Sale.

The property is known as the **Montezuma Silver Mining Co. of Utah**; is situated on the Little Cottonwood, Alta, Utah, comprising the "Montezuma," "Savage," "Hiawatha" and "Last Chance" locations, also the "Buckland" tunnel, 1500 feet long, and over it the "Savage" tunnel, 800 feet long, with openings connecting the tunnels. The mine is in good working order, with considerable ore in sight. The ore is rich in lead and in good demand by the smelters.

For terms and any other information, address David R. Pelree, Sec'y and Treas., 210 West Larned St., Detroit, Mich.

FOR SALE.

23,000 Feet 10 5-8 Inch Steel Pipe,

Lap welded and screw joints. Weight about 27 lbs. per foot. Will stand about 600 lbs. pressure

Three Compound Duplex Worthington Pumping Engines,
Several Pumps and Heaters,

And everything pertaining to a plant capable of elevating 3200 gallons water per minute 550 feet. Plant only operated one week. Address

LEE CHAMBERLAIN & CO., Los Angeles, Cal.

FOR SALE.

The Following Machinery, Nearly New. Now Located in State Agricultural Exposition Building at Sacramento:

One 16x42 R. H. Poppet-Valve O'Neil Automatic Cut-Off, 100-Horse Power Horizontal Engine, built by the Union Iron Works, with Band Pulley, 22 in.x124 in. Pipe Connections and Valves complete, as it now stands.
One 22 in. Double Leather Driving Belt.
One 18 in. Union Exhaust Steam Feed Water Heater.
One Buffalo Duplex Boiler Feed Pump 6x4x6.
Two Tubular Steam Boilers, 54 in. diameter, 16 ft. long, in good order, with Furnaces, Grate Bars and Settings complete; one Injector for each Boiler, and all the necessary Checks, Valves and Gauges.
One Stack, 48 in. diameter by 80 ft. long.

For price and particulars, address

EDWIN F. SMITH, Secretary, Sacramento.

Assessment Notices.

ROSE CREEK MINING COMPANY. Location of principal place of business, San Francisco, California; location of works, Star, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 28th day of June, 1897, an assessment (No. 1) of 15 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room 163, Crocker building, junction Post, Montgomery and Market streets, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 21st day of August, 1897, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 14th day of September, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. M. WILMANS, Secretary.

Office—Room 163, Crocker building, San Francisco, California.

MARGUERITE GOLD MINING AND MILLING Company.—Location of principal place of business, San Francisco, California; location of works, Auburn, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 28th day of July, 1897, an assessment (No. 7), of 10 cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the Secretary, at the office of the company, 237 12th street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 10th day of September, 1897, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 11th day of October, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

F. METTMANN, Secretary.

Office—237 12th street, San Francisco, California. The Secretary will also receive payments from 12 to 5 P. M. at his business office, 225 Sansome street.

INYO MARBLE COMPANY.—Location of principal place of business, San Francisco, California; location of works, Inyo, Inyo County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 27th day of July, 1897, an assessment (No. 30) of 10 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, room 328 Phelan building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 28th day of August, 1897, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on MONDAY, the 20th day of September, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

M. A. CAHN, Secretary.

Office—Room 328 Phelan building, San Francisco, California.

OSBORN HILL GOLD MINING AND MILLING Company.—Location of principal place of business, San Francisco, California; location of works, Grass Valley, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 4th day of August, 1897, an assessment (No. 6) of 35 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the Secretary, at the office of the company, room 11, No. 331 Pine street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 6th day of September, 1897, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 27th day of September, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

R. R. GRAYSON, Secretary.

Office—Room 11, No. 331 Pine street, San Francisco, California.

CONSOLIDATED CALIFORNIA AND VIRGINIA Mining Company.—Location of principal place of business, San Francisco, California; location of works, Virginia Mining District, Storey County, Nevada.

Notice is hereby given that at a meeting of the Board of Directors, held on the 3d day of August, 1897, an assessment (No. 9) of 25 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to to Secretary, at the office of the company, room 29, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 8th day of September, 1897, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 29th day of September, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

A. W. HAVENS, Secretary.

Office—Room 29, Nevada block, No. 309 Montgomery street, San Francisco, California.

OCCIDENTAL CONSOLIDATED MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Silver Star Mining District, Storey County, Nevada.

Notice is hereby given that at a meeting of the Board of Directors held on the 3d day of August, 1897, an assessment (No. 28) of 10 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, room No. 69, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 7th day of September, 1897, will be delinquent, and advertised for sale at public auction, and, unless payment is made before, will be sold on THURSDAY, the 30th day of September, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

ALFRED K. DURBROW, Secretary.

Office—Room No. 69, Nevada block, No. 309 Montgomery street, San Francisco, California.

GOLD RIDGE CONSOLIDATED MINING AND Milling Company.—Location of principal place of business, San Francisco, California; location of works, Nevada and Sierra Counties, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 3rd day of August, 1897, an assessment (No. 5) of 4 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, rooms 12 and 13, No. 43 Sixth street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 18th day of September, 1897, will be delinquent, and advertised for sale at public auction; and, unless payment is made before, will be sold on SATURDAY, the 9th day of October, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

H. SYLVESTER, Secretary.

Office—Rooms 12 and 13, No. 43 Sixth street, San Francisco, California.

THORPE MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Fourth Crossing, Calaveras County, California.

Notice is hereby given that at a meeting of the Board of Directors held on the 9th day of June, 1897, an assessment (No. 7) of 2½ cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, room 44, Phelan building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 17th day of July, 1897, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on MONDAY, the 9th day of August, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

Office—Room 44, Phelan building, San Francisco, California.

POSTPONEMENT.

By order of the Board of Directors, the day of delinquency in the above assessment has been postponed to August 14th, 1897, and the day of sale to SATURDAY, September 4th, 1897.

A. F. FREY, Secretary.

Office—Room 44, Phelan building, San Francisco, California.

WANTED.

A position as Millman in quartz mill by young man, one who can keep a mill running. Address A. E. CHARLESWORTH, Lockeford, San Joaquin County, California.

WANTED.—A Second-Hand 5 OR 10 STAMP MILL.

Address, stating particulars, price, etc., A. B., this office.

WANTED.

Able, rugged man, as Roaster, thoroughly familiar with oxidizing dead roast of gold concentrates in Bruckner furnace. None other need apply. Address quickly, stating experience and qualifications.

JACKSON & LAKEVIEW MINING CO.,
LUNDY, CAL.

Wanted for the Yukon,

Two or three capitalists to become associated with two experienced explorers and gold miners, one of whom has spent five years in the Yukon and tributaries exploration, is thoroughly conversant with the topography of the whole Yukon auriferous belt and knows of valuable diggings yet untouched which can be secured and operated to great advantage by the methods proposed to be adopted. The highest references will be given, and required. Amount necessary for expenses and plant, $25,000. This being a genuine proposition only principals need apply. For further information, address

"YUKON," this Office.

CAPITALISTS, ATTENTION!

Advertiser offers for sale State right for California, Colorado or Montana, for a recently patented Amalgamator and Placer Mining Machine. This Amalgamator is guaranteed to handle from 80 to 90 yards of soil and from 100 to 112 yards clear gravel per ten hours, with but one miners' inch of water. Will handle output of 100-ton quartz mill in ten hours. Guaranteed saving of from 95 to 98 per cent of values. Has saved 98 per cent Snake river gold and made expenses on 12-cent ground. Will revolutionize placer mining where water is scarce; flow of one miners' inch all that is required. All material travels over perfectly level surfaces. But one State for sale. Patentees need money to fill contracts, and a State right can be purchased at a reasonable figure and on easy terms. Further particulars by addressing

AMALGAMATOR, care of this Office.

PACIFIC AMALGAMATOR

FOR QUARTZ MILLS, Placer & Beach Sands.

Takes the place of plates. Will save the fine as well as the coarse gold. It has a large silver-plated amalgamating surface, constructed so as to produce a complete contact. Will save fine gold that cannot be saved on ordinary plates. No extra cost of operating. Cheap, durable and practical. Send for Catalogue. PACIFIC MINING MACHINERY CO., 127 First Street, San Francisco, California.

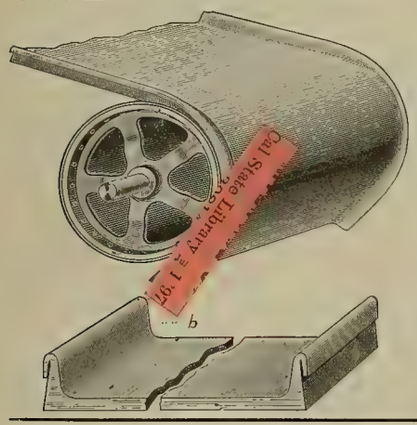
Box 424,.....Los Angeles, Cal.

THE BROWNELL "PATENT LIP" FLANGE FRUE VANNER BELTS.



It has taken years of ceaseless testing and experimenting to produce the superior belt which we now offer, with elastic flanges and pliable body reinforced with specially woven duck. Every belt is manufactured by experienced workmen, and carefully tested on machines especially built for that purpose; consequently we are to-day manufacturing the best belts that mechanical ingenuity, combined with honesty of construction, can possibly produce.

RAWHIDE GOLD MINING COMPANY,
JAMESTOWN, TUOLUMNE CO., CAL., Feb. 21, 1897.

J. S. BROWNELL, ESQ.—DEAR SIR: Replying to your query of Feb. 15th, will say that I have used your Patent Lip flange belt more than one year, and judging from their appearance after more than one year of hard service, I do not hesitate to say that they are the best belt I have ever used and I take great pleasure in testifying to the fact. Yours truly, W. A. NEVILLS, President.

AMADOR CITY, CAL., Feb. 18, 1897.

MR. J. S. BROWNELL—DEARR: I take pleasure in saying that I have used your Patent Lipped flange belt for several years while connected with this company, and I consider them the best that we have used. The quality of rubber in the flange seems to be the best, and we are not bothered with the flange cracking and thereby destroying the life of the belt. At present we are using 14 concentrators, and have in use several kinds of belts. We consider your Patent Lipped flange the best. Yours very truly, THE CONS. SOUTH SPRING HILL G. M. CO.
By JOHN R. TREGLOAN, Superintendent.

The Huntington Mill is so well and favorably known among mining men throughout the world that any description of it would seem superfluous. They are in use in the United States, Canada, Mexico, Central and South America, Australia, China, Japan and South Africa—in fact, wherever mines exist, and have given the best satisfaction of all quartz-crushing mills. The construction of this Mill has lately been much improved and we claim it to be the cheapest, most efficient, simplest and most durable Mill upon the market. Catalogue upon application.

No. 1937.—VOLUME LXXV. Number 8. SAN FRANCISCO, SATURDAY, AUGUST 21, 1897. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

In Farthest Alaska.

Herewith are presented some engravings from Alaska views taken specially for this paper; one being of Forty Mile Camp, looking from Ft. Cudahy across Forty Mile creek; another showing the laborious method of whipsawing lumber to build boats. The four men have a hard time of it getting out a little sawed stuff, and one can readily understand why $200 is charged is for 1 M feet. The timber is from five to seven miles from the shore of the lake, and, when laboriously got out, has to be carried that distance. Probably were they back in civilization they would find it cheaper and easier to have a boat built according to their own designs here, and taken up there all ready for use. The picture of the Alaskan party and dog team gives a good idea of how experienced Alaskans are accoutered. The photo is of Capt. MacLyon and party, who have made several trips through that region. In this regard it is of interest to note that Prof. S. C. Linderman, after whom Linderman lake was named, tells how he dressed when there. He says: "I wore silk underderwear and red flannels, which I steeped in lard oil. Outside my woolen clothing I wore Hamburger overalls of corduroy. I never sufered from the cold in that dress."

The steamship Queen, at Douglas Island, (see page 169), is a familiar sight, and the interior of the miner's tent, with a primitive map on its walls and ceiling, as portrayed on the same page, shows that in his case the naming of lakes and rivers is a matter of private judgment.

It is to be borne in mind that that country is not so "new" as some would have us believe. Since 1875 California miners have been bringing out gold from almost as far northwest as the discoverers of the '96 bonanzas. In '93 the Alaska gold yield was given by this paper as aggregating $1,035,823.

The Yukon section may be divided into three divisions: the Upper Yukon division, lying entirely in the British Territory and embracing the White, Stewart, Pelly, Salmon, Lewis and Hootalinqua rivers, which branches form the headwaters of the main Yukon; the middle division embraces Fort Reliance and down to the mouth of the Tananah; the lower division from the mouth of the Tananah to Norton sound and Bering sea. It is in the middle division that the principal discoveries have been made, or on Forty Mile, Sixty Mile, Miller, Glacier and Birch creeks and the Klondike river with its tributaries. Very little prospecting has been done in the lower division, although gold has been found in paying quantities along the Koyoukuk and Tananah rivers and a few of the bars profitably worked.

As far back as '87 published accounts in these columns read very like the columns of description now appearing all over the country. According to the *Alaska Mining Record* G. Carmach is entitled to the credit of discovery of the now famous Klondike placers. Last August this individual, who since 1887 had been a prospector in the section above Forty Mile, secured a contract to supply logs for the sawmill there and was looking for suitable timber along the Klondike. Vague reports had been previously put in circulation by the Indians of that region as to the existence of coarse gold along the several tributaries of that stream, but these rumors were regarded as valueless. Carmach, however, true to his mining instincts though driven by ill fortune to other temporary pursuits, prospected at odd moments and about the middle of the month found $1.60 to the pan on the high rim of Bonanza creek, which enters the Klondike from the south a short distance from the confluence of the latter with the Yukon. He was obliged, however, to continue logging operations for a time to get provisions, but in the last days of August returned to his claim with a few weeks' supplies, in company with his wife, her brother and another, all Indians. As he was very short of appliances he could only put together a very defective apparatus with which to wash the gravel, and the dirt itself he had to carry in a box on his back a distance of from 30 to 100 feet to his primitive sluices. With all these disadvantages the three men, working very irregularly, succeeded in recovering $1200 in eight days, and Carmach asserts with reason that with proper facilities a greater sum could have been taken out in a fourth of the time, for much was lost in the tailings from his defective apparatus. He reported his find to the people at Forty Mile, but the news was received with incredulity, for the Klondike had been prospected several times before without encouraging results. His dust, however, was incontrovertible evidence and the rush to the new fields began; returning Yukoners brought the news to Juneau and men began preparations for a start in the spring for the new fields; mail carriers and parties coming out during the winter and early spring brought confirmatory reports and a few hurried away; but it was not until the early part of last month that the richness of the placers was realized, and when their real value was confirmed the mad rush set in and has continued until it already has assumed proportions greater than any known in the world's history in such a remarkably short period.

This paper has given all the facts from a scientific mining standpoint, discussed the chances and possibilities, and advised that those who are determined to go should at least wait till next spring. Thousands are still rushing in, many of them poorly provided. Some are already returning, and when they read of the horrors experienced the coming winter will congratulate themselves on being out of it.

Coast Industrial Notes; Commercial Paragraphs; Recently Declared Mining Dividends; Personal, 177. List of U. S. Patents for Pacific Coast Inventors; Notices of Recent Patents, 182.

Amending Federal Mining Laws.

At various times efforts have been made to amend the federal mining laws, or rather, to get into some kind of practicable working shape the cumbersome mass of conflicting memoranda known as the federal mining statutes. In the last twenty years several attempts have been made to secure some satisfactory federal action, but each time senatorial courtesy allowed Senator Stewart of Nevada (who has a copyrighted mining law of his own) to sidetrack any and all efforts in that direction. He annually introduces his own law and occasionally has it passed by the Senate, which is as far as it gets.

Last November the California State Miners' Association appointed a committee whose duty it was to prepare such legislation as was deemed necessary to be submitted to the annual convention which meets next October, and, if reported favorably, to be presented at the session of the 55th Congress next December. It is understood that that committee is now preparing such report.

At the recent International Gold Mining Convention held in Denver, Colo., a committee was appointed to take up the matter. Under date of the 17th inst., the California member of that committee writes as follows:

TO THE EDITOR:—Having been appointed by the Transmississippi Congress a member of the committee to formulate suggestions to the Congress of the United States with a view to the alteration or amendment of the Mineral Land law as it now exists, I have the honor to lay before you the amendments which, to me personally, seem necessary and to ask for criticism and suggestion on the part of miners and of those taking an interest in the mining industry. I assume that all will agree that the present statutes are cumbersome, fruitful of litigation and altogether unsatisfactory to the legitimate miner. As far as the laws touching placers are concerned, I am of the opinion that they may be left about as they now are. I would amend them simply by extending the list of minerals, subject to location under the "placer act," and inserting all the useful metals and earths, as well as the coal oils, hydrocarbons, bauxite, monazite, etc., etc.—in a word, all the natural substances used in the arts and the subject of commercial utility. As to the laws touching veins or lodes:

1st. I would do away with the extra lateral right altogether. But, in order that those who prefer to keep this right may have their choice, I would permit patenting under the present law until Jan. 1, 1900.

2nd. I would make the unit of location 1000x1000 feet in the form of a square, or, if there be not available ground to that extent, then any amount less and of any form. In order that flat or low dipping deposits may not be too soon lost by passing beyond the lines of surface location, I would allow the same person or persons to take up an additional claim of 1000x1000 feet on the side of the dip—the same person to be allowed not more than two such claims in the same district.

3rd. I would do away with the annual expenditure ($100) as now, and in its stead require a payment to the U. S. Surveyor-General, or to some proper officer, of the sum of $50 for each claim, in cash, every year until patented. If less than 1000x1000 feet, then a less proportional amount. In consideration of this payment, a deputy of the Surveyor-General shall, upon call, be sent to the district and authoritatively fix the location. Further, in order that no "snap judgment" be taken, I would have a district recorder appointed whose duty should be simply to take the names of the locators in the order presented to him so that "first come should be first served"—the recorder to be obliged to forward such list or lists to the office of the Surveyor-General at least once in each and every month.

There are other minor details which can be attended to before finally passing the amendments. The above-mentioned three will, I think, furnish matter enough for the present. I would add that persons wishing to criticise or alter might address their replies to you. The matter is pressing, as the committee meets on September 7th next.

W. S. KEYES, M. E.

There are, probably, very few miners in the United States who will not heartily concur in the suggestion of Col. Keyes that the extra lateral theory and practice be abolished altogether, and with it the apex, parallel end lines, etc., which have done more to make vexatious and expensive mining litigation in this country than anything else. With the exception of Bolivia, no other country has a similar statute.

In a very short time the California member of that important committee will meet with his colleagues, and any criticism, adverse or affirmative, will aid him in placing these matters before the conference at Denver.

Dark Days for Silver.

The report of the Ontario and Daly Mining Companies of Utah for 1896 is of present interest.

Dividends were paid monthly during the year, 10 cents each, and amounted to $180,000 for the twelve months. The cost of mining for the year was $8.37 per ton, a reduction of $1.23 per ton compared with 1895, this reduction being because of the small cost of handling the water through the drain tunnel. The cost of prospecting (dead work and sinking shaft No. 2) increased, and the total cost for operating expense for 1896 was $21.51 per ton, $1.02 per ton less than the like cost for 1895.

The mine product was 662.23 fine ounces of gold, 1,094,425.07 fine ounces of silver, the whole selling for $741,593.77; ore sales, $35,259.90; grand total, $776,853.67. Ore, gross tons, 35,029; ore hauled to mill, 30,190. The ore milled averaged 39.28 ounces.

The recapitulation of operating expenses shows the following:

Net tons ore—per ton cost.			
Mining	28,912 tons at	$8.47	$241,951.32
Prospecting	28,912 tons at	4.38	126,759.90
Sundries	28,912 tons at	1.16	43,719.90
Hauling	28,380 tons at	.44	12,475.93
Milling	30,370 tons at	6.16	186,459.72
Bullion expense	30,270 tons at	1.00	30,265.75
		$21 51	$641,632.61
Ore expense, 532 tons ore sold			1,190.27
Total			$642,822.88

The fiscal statement shows a cash balance on hand at the beginning of the year of $462,638.44; at the close, $366,342.13; decrease during the year, $96,296.31.

A final table closes the report, showing that since the incorporation of the company it has produced 538,283 tons of ore; 33,095,117.30 fine ounces of silver; sold for $30,988,510.93; dividends, $13,355,000. Total value of all assets, $2,176,163 29.

President Chambers of the Daly makes a detailed report, recites the operations of the year, tells of the drain tunnels and the workings, and of the reduced coal prices.

The Marsac mill saved values up to 96.55 per cent; the average yield of ore per ton was in 1894, $21.65; in 1895, $23.01; in 1896, $20.46, the decrease being due entirely to the decreased price of silver. Bdt "notwithstanding the cost of drain tunnel and other improvements, and the extremely low prices of silver, we have added to our surplus."

Ore milled during the year, 20,327 tons; ore sold, $2168.18; this yielded 861.947 ounces of gold and 714.373.05 fine ounces of silver, the two selling for $497,657.51; net, $491,063.02.

The cost of ore extraction was $10.21 per ton for the 20,259 tons extracted, $206,791.23; hauling, $16,779.45; reduction, $145,659.76; marketing, $6572.58; prospecting, $38,849.36; sundries, $32,377.84.

The operating expenses were, per ton, $22.01, or $447,030.16; half cost of drain tunnel, $33,896.51; dividend No. 76, $37,500; balance cash on hand December 31, 1896, $160,725.47; and other items bring the total expenditures to $694,340.61.

Receipts—Cash balance December 31, 1895, $196,721.31; bullion sales, $462,333.27; sulphide sales, $33,156.06; ore sales, $2146.22; outstanding checks, $983.75; total, $694,340 61.

The output and dividends since incorporation were: Ore produced, 270,002 tons; ounces silver, 11,158,929.66; ounces gold, 11,202.80; sold for $9,451,661.67; dividends, $2,887,500. Total value of all assets, $984,826.06.

The above is the showing of two great properties that during the week have been compelled to close; 600 men in the town of Park City, Utah, are thrown out of employment. From Montana, Idaho and Colorado come similar reports. Silver 24 pence in London is the cause. The cause of that price has been heretofore discussed.

During the last seven years the great silver mines of the country have one by one put out their lights; now, even those who have so far been able to produce silver as a sort of by-product are closing down, in the fear that bedrock has not been reached, though some mine managers say that even at 60 cents product will not pay. It is a business proposition; there is no spite work nor political effect; in many cases it simply ceases to be possible to operate except at a loss under present conditions.

The only thing to do under the circumstances is to make the best of a bad situation. Co-operation of all interests involved will insure the best results. At Creede, Colorado, the smelter companies, the railroad officials, the mine owners, the working miners have got together and have outlined a plan whereby the mines can be kept going. The smelters and railroads make concessions, the mine owners make certain sacrifices, the working miners say they will accept a reduction in wages from $3 per day of eight hours to $2.75 in wet mines and $2.50 in dry, rather than to have the mines close down. With such mutual determination a community dependent upon its silver mines for support can do much toward pulling through in these dark days for silver.

In this connection it is to be noted that a year ago to-day silver was quoted at 66⅛ cents per ounce, and lead $2.67 per 100 pounds. To-day, while silver is 52 cents its baser brother is $3.70. From this it is evident that where a property is producing ore 20 per cent lead and 20 ounces silver per ton the yield is better than one year ago. Of course, ore yielding say 35 ounces silver and 16 per cent lead would not make so favorable a showing.

World's Production of Precious Metals.

M. de Foville, Director of the French Mint, has published a report of the world's production of gold and silver. Like preceding investigators he divides the history into four unequal periods. The first ends with the Middle Ages, and is of purely historical interest. In the fifteenth century Europe possessed a slender stock of gold and silver, whose total has been usually estimated at one thousand millions of francs—$200,000,000. The second period begins with the discovery of America and closes in the middle of the present century; the third extends from 1850 to 1875, comprising the third quarter of the century, and the fourth, beginning in 1875, extends to the present time. In constructing any approximately accurate table of the production of gold and silver during the 402 years which have elapsed between the date of the discovery of America and the last year of complete returns—1896—it is evidently necessary that some uniform terms should be used both of quantity and of value. The director of the French mint favors the usual standard of comparison of 15½ to 1, estimating the value of each kilogramme of gold at 3,444 fr. 44 cent., and of each kilogramme of silver at 222 fr. 22 cent. A kilogramme, it may be noted, is equal to 2.6803 pounds, or 32.16 ounces troy.

Beginning with the period between 1493 and 1850, comprising 358 years, he finds that the total production of gold was 4,752,070 kilogrammes, valued at 16,368,200,000 francs, and of silver 149,826,750 kilos, valued at 33,294,800,000 francs. The average annual production of gold, which begins with 5,800 kilos, reaches at the end of the period 54,759 kilos, while the average annual production of silver, which begins with 47,000 kilos, closes with 780,415 kilogrammes. But, while at the beginning of the period, the average annual value of the production of gold is double that of silver, it is less than 10 per cent in excess of it at the end of the period, and, but for the gold discoveries in this State the average annual value of the silver product would have been very much the greater. In the second period—1851 to 1875—is reached a time in which the gold production greatly exceeded in value that of silver, except as to the one or two years with which it closes. Between 1856 and 1860 the annual average of gold production was 201,750 kilos, valued at 694,900,000 francs, and of silver 904,990 kilos, valued at 201,100,000 francs. For the entire period the production of gold was 4,775,625 kilos, valued at 16,449,400,000 francs, or a little over the entire value of the preceding 358 years. Of the 73,000,000,000 francs of gold and silver produced between 1493 and 1875, South America yielded 26,000,000,000, Mexico 18,000,000,000, and the United States 8,000,000,000; the contribution of the New World amounting in all to 53,000,000,000 francs.

In the period between 1876 and 1895 there is a steady increase in the production of silver, accompanied by a temporary decrease of the gold product from its highest point, which was followed by a rapid increase to figures greatly in excess even of those reached during the early days of the Australian and Californian discoveries. As compared with 1876, the production of gold in 1895 was twice as great, while that of silver had increased 2½ times. In the 402 years over which this review extends, it appears that there have been produced 45,000,000,000 francs in gold and 55,000,000,000 francs in silver, making for the whole period an average annual production of the precious metals of about 250,000,000 francs. But the annual averages of our time, as compared with those of previous centuries, show an extraordinary rate of progression. For example, the average annual product of the sixteenth century was 80,000,000 francs, that of the seventeenth 115,000,000, and of the eighteenth 193,000,000 francs. For the first half of the nineteenth century the annual production of both metals averaged about 227,000,000 francs, but for the twenty-five years following, between 1851 and 1875, there is a leap to the annual average of 930,000,000 francs, two-thirds of which was in gold. But even this average is exceeded between 1876 and 1885, in which ten years, however, the production of silver reaches a nominal value about equal to that of gold. Since 1886 the increase in the annual production of the precious metals has been still more rapid than in the ten years preceding. The average between 1886 and 1890 was 1,340,000,000 francs per annum, of which 750 millions represented silver at its nominal coinage value. Between 1891 and 1895 the annual average was 1,934,000,000 francs, and during these five years the course of progression has been so rapid that we pass from a gold product in 1891 of 677,000,000 francs to one of 1,030,000,000 francs in 1895, while of silver the annual production has advanced from 939,000,000 francs of nominal value in 1891 to 1,144,000,000 francs in 1895, the production of the precious metals between 1851 and 1895 being almost exactly equal to that of the whole preceding period since the discovery of America.

Concentrates.

TRINITY is but one of the 57 counties of California.

THE price of gold in London is 77s 11d per ounce standard.

MINING helps every other business and competes with none other.

AT 59⅜ for silver, the bullion value of a silver dollar is 42⅝ cents.

CRIPPLE CREEK, Colo., figures on a million a month as its gold output for '97.

THE Hope mine, Basin, Montana, now gives promise of becoming a copper producer.

BRITISH COLUMBIA mines are petitioning the Dominion Government for an export duty on ore.

THE Helena-Frisco M. Co., Gem, Idaho, resumed operations August 1st. The mill is running smoothly.

THE low price of silver is shutting down the few remaining silver mills. The Sioux mill at Robinson, Utah, closed this week.

IN the Klondike to-day the sun rises at 4:24 and sets at 7:36. In four months from to-day it will rise at 10:13 and set at 1.47.

THE De Lamar, Nev., mill is now treating 300 tons per day. It is locally asserted that the ore is being put in the mill at a cost of 35 cents per ton.

COLORADO'S State Mining Bureau is issuing special bulletins from various parts of the State and publishing mining data as fast as collected.

NO BETTER method of getting gold from black sand is known than the old-fashioned system of sluicing, using quicksilver, copper-silvered plates, etc.

THE exports of gold from Western Australia during July amounted to 48,811 ounces, valued at £185,482, against 16,258 ounces, valued at £61,782, in July, 1896.

THE nomads of '97 unlike the argonauts of '49 can not fall back on the agricultural resources of the country, if unsuccessful. They must get gold, get out, or starve.

SAYS a London dispatch: "The heart of the British empire has been touched by the Klondike placer gold-digging news." Later on its pocket will be "touched."

NEW YORK CITY dailies are publishing Klondike advertisements by the page, mostly from those who figure that "there is a sucker born every minute"—and sometimes twins.

ORE has been struck again in the Custer, near Wallace, Idaho, which probably means more for the Coeur d'Alenes than any strike that has been made there for ten years.

ALL mining notices for publication—notices to co-owners, applications for patent, etc.—must be published in the newspaper of general circulation published nearest the property.

FORTY men threw up good jobs in the Everett, Wash., smelter to go to the Klondike; one stack of the smelter has had to be closed, the company being unable to get men to operate it.

THE Bullion-Beck, Utah, at its last meeting passed its dividend and virtually concluded that, unless the railroads make concessions in charges, the company must at least temporarily shut down.

THE number of mining locations now being recorded in this State is very large. This week in looking over some California mining papers "Concentrates" counted seventy-eight filed for record in five counties.

IN all probability New Mexico will acquire statehood during McKinley's administration. The bill for admission will be introduced in the House at the next session by Representative Ferguson.

THE old Pennsylvania mine, Brown's Valley, Cal., twelve miles from Marysville, has been unwatered and modernized. A 20-stamp mill will be built by Chas. Webb Howard of San Francisco and associates.

UNDETERRED by the fate of Andre, a scheme for reaching the Klondike has developed in Oakland, Cal., where an organization is being effected to start a balloon service between Juneau and Dawson City.

THE Kennedy mine, Amador county, Cal., is over 2100 feet deep, 400 feet below the level of the sea. The deepest gold mine in the State is 2400 feet, on dip of the vein, the Sierra Buttes, Sierra county, Cal.

THE capital stock of the New Idria Quicksilver Mining Company of this State—100,000 shares, par value $5 each—has been listed on the Boston Stock Exchange. The company paid a dividend of 10 cents per share last June.

EARLY copies of the State Mineralogist's reports, that is, issues of former years are out of print and cannot be supplied, and from present appearances there will be none published to follow the 13th, which is the last of a valuable series.

THE Trail, B. C., smelter turned out its first gold ingot on the 10th. It bears the initials B. C. S. & R. Co. It was the first time refined gold has ever been produced in the Dominion, and the first refinery north of the 49th parallel.

UNDER the new State mining law, $50 in work must be done on a claim within sixty days after posting the preliminary work. Ordinarily, it will be found cheaper and easier to do the work than to start making a "test case" of its constitutionality.

DURING the week ending August 10, there was entered at Nelson, B. C., for export 1,136 tons of ore and matte valued at $126,938. The week's exports make the total for the current year $4,372,060, including the Slocan ore exported via Revelstoke.

THE Anaconda, Montana, copper mines give employment underground to 3000 men, whose wages amount to $10,500 a day. Six thousand tons of ore are daily handled, yielding at the smelters between 10,000,000 and 12,000,000 pounds of copper monthly.

FIRE from an overturned oil can on the 800-foot level of the Stickle mine, Angels, Cal., last Tuesday, required the flooding of the property, which will cause a cessation of operations for some weeks. No lives were lost. The extent of the damage is as yet unknown.

IT is the opinion of Judge Goodwin of the Salt Lake *Tribune* that, "if the Klondike boom continues, the chances are that it will not be five years before they will be running hoisting and reduction works up there by electric power generated from the Aurora borealis."

SEVERAL wealthy mining men of San Francisco state their intention to visit the Klondike region next season, going with complete outfits and in a comfortable manner. It has long been the fashion to take a trip to Alaska, and they will extend their travels a little farther than the ordinary tourist.

EL DORADO Co., CAL., hears of a plan to build a big power station on the American river to supply every mine and mill in the county with such cheap power that a good many of the low-grade propositions now lying idle can be worked at a profit. The scheme is a feasible one.

IT is believed that in parts of Utah the same condition will develop in silver properties as did on the Comstock, Nevada, as depth was attained, viz., an increasing percentage of gold in the ore. It is even now declared in the case of the Mammoth that 70 per cent of the ore value is in gold.

J. H. BURFEIND of Salt Lake City, Utah, has a patent described as "an improvement in the extraction of precious metals from their ores, which consists in the treatment of the cyanide product or precipitate containing the metals preparatory to melting the product with sulphurous acid."

IF anything is to be done toward the celebration next January of the fiftieth anniversary of the discovery of gold by Marshall at Coloma, Cal., it is time to go about it. So far as erecting a monument is concerned, the $1,300,000,000 in gold contributed by California is a pretty good monument itself.

BRUCE WHITE, manager of the Slocan Star mine, B. C., denies the report that the mine will shut down. J. C. Eaton, manager of the Whitewater, says that with lead at or near its present figure the leading Slocan mines could produce at a profit, "even if silver were to fall to 40 cents per ounce."

"PROSPERITY" is when people spend money with reasonable expectation of return. The 77,000,000 people of the United States, if they each saved only 10 cents a day for the last four years, would now have accumulated nearly $11,000,000,000. This sum put out would create prosperity enough to make it a continuous fact.

IT is none too soon to call conventions in the several California mining counties to select delegates to the October State convention and discuss the policy and acts of that meeting. Upon the interest manifested by the interior counties depends largely the success of the convention and the advancement of the mining industry of the State.

SOME funny mining decisions are occasionally made. New Zealand's highest legal tribunal recently decided that "a stamp-mill is not machinery for gold-saving purposes or processes." The learned judge who gave the decision solemnly asserted that shoes and dies were unessential thereto. The case came up at Auckland on a question of admission free of duty.

TACOMA reports that agents of the Alaska-Treadwell Gold Mining Company have been there securing men to take the places of those who left the Douglas Island mine for the Klondike. Three to four dollars a day and expenses got about twenty-five men. The Alaska papers report a dearth of good miners, several having left their jobs in the rush up the Yukon.

AT Creston, Minas Prietas, Sonora, Mexico, the roasters and cyanide plant are treating 100 tons a day, and are said to be the only ones adopting that method. The tailings are mixed with low grade concentrates and then passed through the roaster with salt, in order to convert the silver into the form of chlorides. From the roaster the pulp goes on to the cooling tanks, each tank taking 100 tons. Good results are reported.

COUNTLESS columns of rot are still being written about the Klondike. It is a little wearisome to have interviews wired from New York from men who never crossed the Alleghanies. "Official" guides to the Klondike are being issued by enterprising Chicago and St. Louis publishers, and are daily received at this office "for notice." They are made to sell, and are noticeable only for the varied assortment of misinformation contained.

IN the illustrated notice of the Bannack, Montana, dredgers last week the fact was omitted that the elevator dredge is operated solely by electric power generated by water power from a stationary shore plant, conducted by wires to the floating dredge, which carries the various motors, hydraulic lifts, elevators, dump boxes, sluice heads, etc., required in digging, moving, sluicing and disposing of the auriferous gravel and underlying bedrock.

CHIEF ENGINEER NURSE of the Department of Public Works says the borings demonstrate that the Newtown shoals can be easily removed. A good dredger, aided by well constructed jetties to concentrate the force of the water, would remove the obstructing shoals and increase the carrying capacity of the Sacramento river to such an extent as to improve navigation, and solve, in a great measure, the problem of controlling the flood waters of the lower Sacramento.

A MINER suggests that now that silver is slumping out of sight holders of silver claims should be exempted from the required assessment work for '97. Under the circumstances it is not likely that even in the absence of the required amount of work that any one these times would be in feverish haste to jump a silver claim. Government relief is, however, impossible this year, even were the idea favorably received, as Congress will not meet till December next.

TWO HUNDRED tons of pig lead were exported on the 14th by the Pueblo Smelting & Refining Company to Liverpool via Galveston. Most of the ore from which this lead was extracted by the Pueblo company was imported from British Columbia during the interval which elapsed between the time that Congress passed the Dingley tariff bill and the time that President McKinley signed it, but the ore was taxed under the new law. The company has appealed the case.

THE ordinary British mining prospectus is useful sometimes as showing what should be avoided. It often contains little but the glorification of the properties which adjoin the mine that is to be acquired by a privileged public. The regularity of the ledge, the consistently high grade of the ore, and the low rate of working expenses in the next-door neighbor, are brought forward as incontestible arguments that the same conditions will be found to prevail on the new company's side of the boundary, the fact being that close contiguity to a paying mine is often viewed by practical miners as opposed to certainty of extensive continuance.

A GOOD deal of useless and misleading statement has been made during the last two weeks regarding Trinity county, Cal. A rich find was made, as has been the case hundreds of times before, and that is all there is to it. Gold is there in abundance the same as in other sections of the State, but it is not to be picked up. Any one going to Trinity must remember that conditions there are no different from anywhere and everywhere else—nothing is to be had except by hard work. Several valuable articles have appeared in these columns on the geology, working, practical value, etc., of Trinity county. The most recent was in the issue of Feb. 6, '97.

AT the La Cigale mill, Mercur, Utah, President Mackay and Assayer Packard have been experimenting as to a change in the method of applying the cyanide solution to the ore, and say that when the solution is forced through a false bottom in the tank into perforated pipes rising through the ore the values are leached out much quicker than by the ordinary way of allowing it to percolate through the ore. In their experiments 68 per cent of the gold was taken out in twenty-four hours and 92 per cent in forty-eight hours. With this method the solution is drawn off from the top of the tank and is then filtered before going into the precipitating boxes. In this way all the slime is taken out and does not check the action of the zinc in precipitating the gold.

PROF. EMMENS of New York City has a better thing than the Klondike. He takes Mexican silver dollars, compresses them in a vacuum, causes a rearrangement of the molecules, thus converting the mass into argentaurum, which the United States Mint buys for gold, the profit being $4 per ounce. It seems that both metals were originally alike and that the difference between them was due to the fact that the white metal had gone through less vibrations than the yellow. That is, the particles composing silver had not, at a certain stage, received as much electric agitation as had the yellow particles. This beats the plan of getting gold from sea water as proposed by Prof. Pearce, and is even easier than prying out $40,000 nuggets in Trinity or Tuolumne counties.

AT the excavation for the Golden Gate mill at Mercur, Utah, last week, a big blast was fired. For a week fifty men operated machine drills, sinking 200 holes to an average depth of 20 feet, the extremes being 300 feet apart. When the holes were all sunk, each was sprung by giant powder; then the chambers thus created were filled with black powder, about 6500 pounds being used. When every hole was primed, the entire series was exploded by electric current generated by cell batteries. The explosion threw a mass of rock estimated at 6000 tons a distance of 60 feet, or within a few feet of the point where the retaining wall of the foundation is now being built. So nicely was the quantity of explosives regulated that the mass was moved without material disintegration, and the rock will be cut into blocks for the masonry in the retaining wall.

SEVERAL recipes for cleaning copper plates have been published herein. Smith & Irving furnish the following: When copper plates are stained with verdigris, which prevents their amalgamating with and saving the gold, the plates can be cleaned in the following manner: Thoroughly scrub the plates with fine sand and water, using a coarse gunny sack or scrub-brush. Wash off the sand and then scrub thoroughly with a solution consisting of one part oil vitriol and four parts of water. The acid disintegrates the verdigris, dissolving the oxide of copper, and leaves the plate clean, when it will readily amalgamate with mercury without the use of cyanide solution, except the acid solution should have been made stronger than herein prescribed, in which instances the plate should be washed off with water, and then dressed with a solution of cyanide as usual.

THE latest idea in metallurgy is an ore reduction works on wheels—a reduction plant on a train of cars, each car being devoted to the process or carrying necessary machinery for treating ore; cars containing the business manager, assayers and others. As embodied in the scheme of the Railway Gold Mining Company, headquarters at Chicago, Ill., the president of this concern writes that the plant will be in Prescott, Ariz., about September 1st next in the interest of another equally gorgeous company, with a view of purchasing gold properties. The cars will be run to any specified railroad point in good mining districts. The first cars will contain amalgamation and concentration plants, but the company can and will, if necessary, send out special cars, covering all forms of lixiviation, chlorination, cyanide and other processes; also a car for smelting, a car containing a diamond drill outfit, a car containing an assay outfit; the whole accompanied by a mining expert, business manager, etc. Some of the Arizona miners ought to be able to have some fun out of this thing.

IN New Zealand considerable attention is given to river dredging for gold, where it is considered the cheapest method of mining. A yield of 1.28 grains of gold per yard (30 cwt. to the yard) of gravel—equal to one part of gold in 19,000,000 parts of earth—has been made to pay in Otago with a steam-driven dredge, using coal costing $6.25 per ton. The newest dredges are supplied with two parallel revolving cylinder screens, instead of one, as heretofore, ensuring a more rapid and complete separation of the coarser gravels from the finer gold-bearing sands. Another dredge is being fitted with endless, traveling, self-washing, concentrating tables Several of the dredges now working there have a lifting capacity of ninety tons of material per hour. A modern dredge can by means of its elevator stack its tailings 40 feet above the water line. Nearly all the principal dredges are driven by steam power; there is one exception in Otago, where electrical power generated from a neighboring stream is used. A few of the earlier dredges were operated by current wheels, and it is possible that this plan of obtaining motive power will be resorted to again.

A PRACTICAL formula for estimating the percentage of sulphurets in quartz is given in a recent catalogue issued by the Risdon Iron Works, of San Francisco, as follows: Take 10,000 grains or 20.8 ounces of crushed ore which will pass through a 40-mesh wire screen. Wash the ore very carefully in batea or pan, and rewash as long as sulphurets appear. Dry and weigh. Each grain of sulphurets will equal one-hundredth of one per cent. If the sulphurets weigh 175 grains, the quartz contains one and three-fourths per cent of sulphurets, or, if twenty grains, one-fifth of one per cent. If the sulphurets are worth $100 per ton, the value of sulphurets in each ton of ore is $1.75, or, if one-fifth of one per cent, 20 cents per ton. To test tailings, dry and weigh 10,000 grains. Wash as above. Dry and weigh the sulphurets. Each grain will represent one-hundredth of one per cent, and a loss of one per cent per ton if the sulphurets are worth $100 per ton. Thus if the 10,000 grains of tailings yield three and one-half grains of sulphurets, the loss is 3½ cents per ton in sulphurets. If the sulphurets are worth $60 per ton, multiply sixty by three and one-half, and 2.1 cents is the value of the sulphurets in one ton of tailings. If they are worth $375 per ton, multiply as above and the value in each ton of tailings is 13.12 cents per ton in sulphurets.

Monazite From Idaho.

Written for the MINING AND SCIENTIFIC PRESS by WALDEMAR LINDGREN.

The Idaho Basin is an intermontane valley, situated twenty-five miles N. N. E. of Boise City, Idaho, in the great granite area of the southern part of that State. Its placer mines have been of extraordinary richness; a considerable proportion of the gold production of Idaho has been and still is derived from this relatively small district. The sand of the gravels and lake beds of the Idaho Basin is entirely derived from the granite and associated dike rocks. It consists of relatively angular and sharp-edged grains, indicating its manner of formation by extremely rapid accumulation from the deeply disintegrated rocks. The heavy minerals found in the granite are also found in the sand, and may be easily separated by washing in the miner's pan; they are always deposited in the sluice boxes together with the gold.

In all parts of the Basin a yellow or brownish yellow mineral forms a considerable quantity of the heavy substances remaining with the gold. It is usually referred to as "yellow sand," and is also given the picturesque name of "Bummer Hill sand," from a locality near Centerville, where it was particularly abundant, but I am not aware that its true character has ever been investigated.

The mineral has been shown to be monazite, this being the first time its occurrence has been noted from the Western States. As well known, it occurs in the granite and gneissoid rocks and gold placer mines of the Southern Appalachians and in several of the northern Atlantic States, also in Brazil, the Ural mountains and other places. There is no doubt that it forms an original constituent of the granite of the Idaho Basin.

One of the samples was obtained in washing a few pans of the sandy lake beds occurring as "false bedrock" in a gravel bench at the junction of Moore creek and Granite creek, three miles east of Idaho City. The heavy residue largely consisted of small yellow grains, and amounted to about two grms. per pan of eight kilograms, which would correspond to 0.025 per cent. Examined under the microscope, the following minerals were noted: Ilmenite, in sharp hexagonal crystals, but no magnetite; zircon, also in extremely sharp crystals of a slightly brownish color; and abundant yellow or greenish-yellow grains, rarely showing crystallographic faces; the refraction and double refraction of this mineral were very high, the hardness not much over 5. The ilmenite was eliminated by the electro-magnet, and the remaining powder, containing about 70 per cent of the yellow mineral, was analyzed by Dr. W. F. Hillebrand. The result showed it to be a phosphate of the cerium metals, the approximate amount of the oxides of the latter being 48 per cent; in these approximately 1.20 per cent of thoria was found. This result identifies the mineral with monazite, the only other similar mineral being xenotime, which is mainly a phosphate of yttrium with but little cerium. The samples also contained a considerable amount of titanium, which would indicate that some titanite is present. Practically, all of the ilmenite was extracted by the magnet.

Another sample, furnished me by Dr. T. Myer of Placerville, Idaho, came from the alluvial gold washings in Wolf creek, near that town. Cleaned from quartz, etc., it appeared as a heavy dark sand, consisting of a black iron ore (ilmenite), rounded crystals of red garnet, sharp crystals of zircon, and irregular grains of a dark yellowish-brown mineral, with waxy luster, sometimes showing crystallographic faces. It was found impossible to extract but a small part of the iron ore by the magnet; there was practically no magnetite present. This sand was examined by Dr. Hillebrand qualitatively with the result of finding phosphoric acid, cerium metals and thorium. The yellowish-brown mineral is therefore in all probability monazite.

Monazite has, as well known, a certain economic value, as the oxides of the rare earths contained in it are used for the preparation of the incandescent gas lights of the Welsbach and other burners. A considerable amount of monazite sand has been produced during the last few years in the southern Atlantic States, chiefly in North Carolina, and in Brazil. The prices have varied between 3 cents per pound up to 25 cents, according to the purity and the percentage of thoria. The North Carolina monazite contains between 0.17% and 6.20% of this rare earth. Mr. Waldron Shapleigh, chemist for the Welsbach Light Company, in a letter of March, 1897, kindly gives the following information in regard to the present production and price:

"At present the monazite sand market is very dull; hardly any demand, and only in lots of a few tons. The present price in North Carolina is 6 cents per pound, but it can be bought a little lower than this. Brazilian sand is quoted in New York at 4¾ cents per pound, fully equal to the North Carolina sand, in five or ten-ton lots. Larger orders can be placed in Brazil at a much lower figure. The price has been steadily downward, as the supply from the mines now opened is far greater than the consumption. It is not generally known that during the first eighteen months or two years of this new industry enough sand was mined and purchased by the largest manufacturers to last several years to come, as so far it has but the one use. The manufacturers did not know how extensive the sand deposit was; therefore were desirous of securing a large and safe stock at the start.

"The largest purchasers are the Welsbach Light Company of Vienna, supplying Europe, and the Welsbach Light Company of Philadelphia, which supplies America. I should hardly think that Western localities could compete with North Carolina and Brazil, unless it is of a very superior quality or a by-product.

"At present there would be no difficulty in placing an order for several thousand tons per year in Brazil and having it filled."

The widespread occurrence of monazite in considerable quantities in the Idaho Basin raises the question whether the deposits can be profitably worked. The present low price and the high cost of transportation and labor makes this very doubtful, unless it can be saved as a by-product in the placer mines. It will be necessary to extract all ilmenite by strong electro-magnets; in this manner a comparatively pure product may be obtained. It is not practicable to entirely separate the zircon and garnet from the monazite. The purest material was obtained from near Idaho City, while that from Placerville and vicinity contains a large amount of ilmenite and garnets. Many data in regard to the character and production of monazite may be found in a paper in the Sixteenth Annual Report, 1894–95, U. S. Geological Survey, by Mr. H. B. C. Nitze.

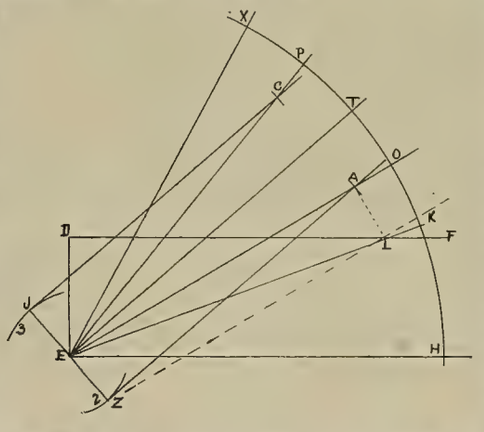
Trisecting an Angle by Ruler and Compass.

TO THE EDITOR:—In the Standard dictionary I find the following:

Trisection of the Angle.—The famous problem of dividing any angle into three equal parts by the ruler and compass; now proved to be impossible of solution.

The Century dictionary also adds to its definition: Now proved to be impossible of solution. Neither of these dictionaries gives any authority, but one of the good professors of mathematics at our State University says that Professor Felix Kline of Gottingen University has lately published a mathematical work in which is found a demonstration of the insolubility of this problem.

Now I am not an angel, but I "fear to tread" in the presence of these great authorities. Nevertheless, let me give to the intelligent readers of your excellent journal the following solution:



To Trisect an Arc of Any Angle.—Let the given angle be XEH and XOH the arc bisected in EO. Perpendicular to the base erect from E any line ED and from D parallel EH draw DF and with radius equal ⅓DE describe arcs 2 and 3.

Now tangent arc 2 and parallel EO draw ZK cutting DF at L; and from L perpendicular ZK draw AL cutting EO at A; and also tangent arc 2 and through A draw ZA.

Then tangent arc 3 and parallel ZA draw JP, and perpendicular ZA draw JZ and on JP lay off JC= ZA, and through C draw radius EP and through E and parallel JC (and ZA) draw ET. Draw also EK bisecting arc TH. Then will arc XOH be trisected.

For since the two right-angled triangles CJE and AZE with sides CJ and JE in the one equal sides AZ and ZE in the other each to each and the included angle in each a right angle, the two triangles are equal in all their parts; hence we have the angle CEJ equal angle AEZ.

Now it is known that radius EO since it bisects the given angle, bisects at the same time the middle third of that angle; and since it does so at the angle ZEA, EP at the opposite but equal angle JEC must bisect the first third.

Again, since the triangles CJE and AZE are equal in all their parts as has been shown, the angles at C and A are equal; and these being alternate C with TEP and A with TEO, TEP=TEO; hence arc PT= arc TO being arcs of equal angles. Arc PO is therefore bisected in T, thus indicating the common limit of the first and middle third.

We have now XT the first third of the arc XOH, and on drawing EK bisecting the remaining arc TH the arc XOH of the given angle is trisected, and with it the given angle. C. P. STANFORD.

S. F., Cal., July 20th, '97.

Innovation in Stamp Practice.

Recent mention of an innovation in stamp practice has occasioned considerable inquiry. It is an English idea, in which the stamps are lifted by levers instead of cams. The experimenter, D. B. Morison, says:

"The experiments were made on a stamp head of the following dimensions:—Stem, 3½ inches diameter; length, 13 feet. Depth of guides: top, 14 inches; bottom, 14 inches. Distance between guides, 6 feet 2 inches. Combined weights of stem, tappet, head, and shoe, 900 pounds.

"Diagrams were taken on a drum 7 inches in diameter, driven at a uniform velocity by a pulley on the cam shaft. A recording pencil was attached to a washer on the stem, this washer being loose on the stem, and held in position by a collar on either side, to that the rotation of the stem was not interfered with. Careful records of the number of revolutions per minute were made by three independent operators, each experiment was repeated at least three times, and the utmost care was exercised throughout to obtain reliable and correct data. The first series of experiments were made under the conditions of dry crushing, or without water in the mortar box; in the second series the heads were immersed in water, as in wet crushing, just sufficient material being kept on the dies in each case to prevent metallic contact. Half the experiments were made with the tappet set to a 6½ inches drop, and the remainder at a drop of 8 inches. Diagrams were taken under the condition of wet crushing at 82, 88 and 97 drops per minute, with the tappet at 6½ inches, the cycle of movement being—(1) raising the weight, (2) dropping the weight, (3) the time during which crushing takes place. When the cam comes in contact with the tappet, the weight is not raised gradually, but is supposed to acquire instantly a velocity corresponding to that of the cam, or, in other words, a blow is struck on the tappet by the cam; and it is this blow which is the cause of much of the intense noise and vibrations which are inherent defects in a cam stamp mill. This vibration may be, of course, minimized in intensity by constructing the framework with heavy scantlings, and providing deep foundations; but the tendendy to vibrate due to the action of the cam still remains, and the mechanical efficiency cannot be increased by simply adding weight of material, but only by removing the cause. In a properly constructed cam, designed to give a drop of 8 inches, for example the vertical component of the velocity of the cam is for 80, 90, and 100 drops per minute, about 1.601, 1.8, and 2.01 feet per second respectively, and having acquired a velocity of 2 feet per second, a weight will continue its upward movement ¾-inch unaided—due to its momentum—less, of course, the retardation through friction. It is principally on this account that a cam stamp has such a low limit of available speed; as it is evident that if the uniform upward velocity is such that the weight travels beyond its normal stroke, then before it has time to reach the die, the second cam meets it, and by receiving the full force of the blow, an accident is very liable to result. A diagram was taken at this critical period, and evidence of the great vibration is shown by the very wavy line made during the upstroke. When the highest point is reached, the fall takes place under the action of gravity, retarded only by the friction of guides and passage through the water. On the terminal velocity depends the energy of blow, and this may be obtained from the diagram by taking a trigonometrical tangent to the curve. Compared with the energy due to theoretical gravity, this loss amounted to 17 per cent, which was the mean of twenty-four experiments, including those with an 8-inch drop, as represented by diagrams. The critical speed, with the latter drop, was found to be about ninety-four per minute, but the vibration was so severe at this speed that difficulty was experienced in obtaining reliable diagrams. The loss in energy with light weights naturally shows a greater percentage than with heavy; and in order to prove this, the head and shoe were removed, and the resulting diagrams gave a loss of 24 per cent. The dry crushing experiments showed a los of 5 per cent less than wet crushing, this being the mean of twenty-four experiments. It will be observed that no fractions of a drop are taken, so that the terminal velocities are correct to within a maximum of one drop per minute."

IN a recently patented clutch to throw a wheel into action on a shaft or connect two shafts, a pair of electro-magnets are attached to levers, which force the jaws to grip the shaft as soon as electric current is turned on; the wires being strung on the shaft with a metal ring at the end to connect them to the switch.

Change in Promotion Methods of London.

A recent letter to the Denver *Mining Record* on the ways and doings of London promoters says that a change has occurred in the promotion methods in that city, and one that may have effect on those who are interested in the sale of mines:

"First of all, the craze for limited liability companies seems to be at its height, and almost everything that can be so transformed is being made into a limited liability company. The consequence is that the day of the small syndicate of wealthy men who took up mines as an investment is going, and instead thereof these folks are distributing their money over a number of limited liability companies, and not in the large sums they did formerly. That is one change that I have noticed. This will make a difference in the sales of mines, for formerly one could almost put a mine in one's pocket, or rather the reports, etc., run over to London and go home again with the money in a satchel. That cannot be done nowadays except in the very rarest cases. Other changes are in the methods of promotion.

"The method of promotion that existed and flourished here last year and for some years before was on this wise: You had a claim to sell which was worth we shall say £20,000. Well, you went to a promoter, and he had the matter looked over, and, if all satisfactory to him, he agreed to float your company on this basis: One-third of the capital to go to him for his trouble, one-third to you and your friends as vendors and one-third for working capital. Out of the one-third which the promoter received he paid all expenses of promotion, which are quite heavy in London, and would easily run into $25,000 or $30,000, besides paying you a certain sum in cash for your mine, for it was only in rare instances that he paid all in cash, the usual method being part cash and part shares. The promoter, therefore, took the risk of the money he expended for promotion expenses, plus the amount he paid you in cash for your mine, and for this he received one-third of the stock. In order to decrease the risk, which would be large if the public did not come in, there arose the system of underwriting, in which certain firms and individuals made a contract with the promoter to take so many of the shares, the price to them being really less than to the public, though, as the law does not allow shares to be sold in such cases below par, the method adopted was to give a bonus. Of course, in the case of a company of say £100,000 that was subscribed for entirely the promoter made a fat thing of it, for he received £33,000 in return for an expenditure of say £10,000. But the public? Well, they paid about three times the real value of the mine, for the vendor was willing to sell at £20,000, and it was not often that a company came out for less than say £75,000, and in such cases, as some of the Anglo-Cripple Creek companies, claims were bought at $140,000 and floated at the nice figure of £120,000—about four times the price paid for the property.

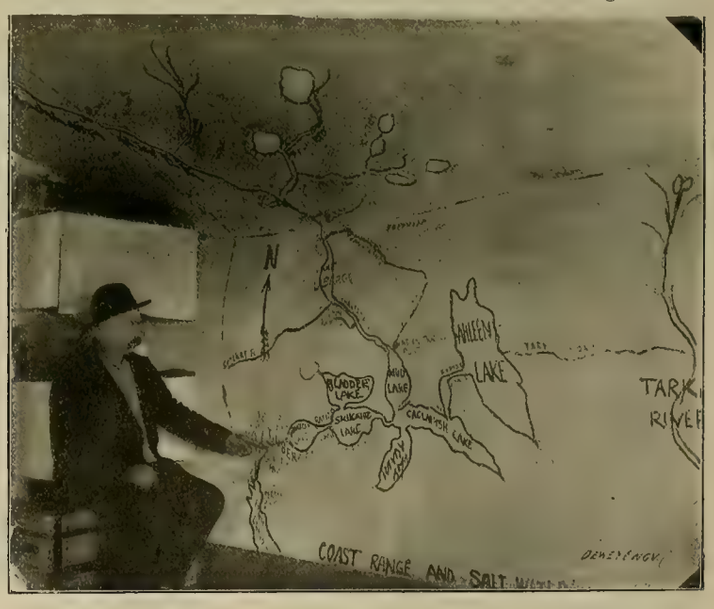
"Of course, this style of business could not last forever. The public had to catch on some time, and they have done so, largely because the companies so overcapitalized and floated have not returned any dividends or been much of a success, so that it is not so easy to float a company, and the promoters do not find the public so quick to bite as they were in the days gone by. The consequence has been that advertising and other such expenses have increased, as it needs more pushing nowadays to get a company floated, and the promoters do not, generally speaking, take kindly to the idea of shouldering all the risks, so that in the case of nearly all the companies that have come out of late, including the Caledonia of Cripple Creek, all the promotion expenses have been paid by the vendor, and that fact is so stated on the prospectus. The public seems to be comforted by this announcement, for it suggests to them that the vendor believes in the property he sells, and also that the huge expenses of promotion and the large fees have not been paid, all of which supposition may or may not be true, by the way.

"However, the point is that if you have a mine or a claim to sell, you will not find your pathway so easy as it was one year ago and before that date; and if you really want it floated here, and the capital so raised, you may find it necessary to put up all, if not part, of the promotion expenses."

THE QUEEN AT TREADWELL'S WHARF, JUNEAU ON THE RIGHT, DOUGLAS ISLAND ON THE LEFT.—(See page 165.)

A Russian Idea.

A Tokio journal is responsible for the following: "Vladivostock, being the terminus of the Siberian railway, is a most important port in Russia. Notwithstanding this fact, for over four months during the cold season the port is blocked up with ice, and the shipping traffic is entirely impossible, and therefore the railway loses much of its advantages. The Russian authorities have been endeavoring for many years to conquer nature, and some years ago ice-breaking ships were introduced to break open the ice, but it has been found that the operation is practically useless. A certain engineer has hit upon the idea of reclaiming the narrowest part of the Tartar strait between Sahgalien and the Russian mainland. He is of the opinion that if this is done the cold current that enters the Japan sea from the Arctic via Bering straits will be checked, and the passage of the warmer tide coming from the south through the Tshuma strait will make the water on the coast of Japan as warm as Vladivostock, and the latter will be warm all the year around. This scheme was presented to the Russian Government for its approval, and it is now engaged in its investigation. There is a probability of this pice of engineering being entered upon after the completion of the Siberian railway."



MINER'S TENT AT YUKON GOLD FIELD.—(See page 165.)

"CAST STEEL" is a term that was introduced to distinguish crucible steel from "blister steel" or "weld steel" at the time crucible steel came into use, and once indicated the highest quality. To-day the term means nothing definite, for Bessemer and open-hearth steels, both basic and acid, now are all "cast steels."

Mining Summary.

CALIFORNIA.

Amador.

Ross E. Browne has resigned the general management of the Oneida mine. Foreman John Truscott remains in local charge as heretofore. The shaft is down 1140 feet and good progress is being made.

At Volcano the *Dispatch* reports the Monte Cristo mill running steadily. The ledge is in porphyry and broken quartz and has been crosscut 60 feet from the footwall and no hanging wall reached yet.

The Iron Mass, a quarter of a mile above the Monte Cristo, is owned and worked by McLaughlin, Richards & Rennie.

The Horseshoe will work what is above their present tunnel, then drive a tunnel to tap the ledge 200 feet deeper and erect a 5-stamp mill.

C. A. Love is the new superintendent of the Weiland mine, where drifting on the 500-foot level is being pushed.

The Amador Queen mine is now down to a depth of 650 feet. Sinking goes on. A drift is being run to the eastward which is now 75 feet from the station at the 500-foot level, and is in the footwall rock.

Butte.

General Manager Evans at Oroville is putting in 40 stamps on the Banner. In the early part of the month he cleaned up from sluicing in the Feather about $2500 from about 180 feet river bed, most of which had been previously worked. He will have another cleanup September 1.

Calaveras.

At the Three B gravel claim on the Calaveras river a shaft will be sunk 80 feet, from which drifts will be run to tap the cement gravel. A mill may have to be erected. C. Page, Mokelumne Hill, is superintendent.

(Special Correspondence).—At Railroad Flat, in the 350-foot drift, north, of the Pettycoat mine, the old shoot has been cut and found rich rock. In the extension south, the Keystone, they have uncovered a new ore shoot that goes $250 to $300 to the ton. The veins of the section are all rich in black metallic slate, with a good graphite gouge.

It has been charged that the veins of Railroad do not carry their gold down, but the showing now in the Pettycoat will contradict this.

El Dorado.

At the Taylor mine the Idlewild Company has the shaft down 1225 feet. Seventy men are at work.

The Saucerman mine, a mile below Garden Valley, has a 5-foot ledge of good grade ore. J. B. Somers is in charge.

W. T. Henson of Placerville and J. D. Bancroft of Chicago have bonded the Golden Stream gravel mine, three miles from Placerville. A tunnel has been run 500 feet. The owners propose building a mill.

The Two Channel Mining Company at Volcanoville employs twenty-five men. The 10-stamp gravel mill is in constant operation. Ten more stamps will shortly be added.

A gravel strike is reported from the Grizzly gravel mine at Grizzly Flat, some going as high as $30 to the pan. A. A. McDonald is superintendent.

At the Grand Victory mine new machinery, pumps and hoisting engine are being put in. Twenty men are employed.

Nugget: The Minnehaha, adjoining the Pocahontas, has been sold to E. W. Roberts of Oakland. Work on a two compartment shaft has begun.

At the Black Jack one hundred men are on the pay-roll. The mill reduces about 700 tons of ore per month.

The Trade Dollar is mining and milling high-grade ore. A winze is being sunk from the Blaine tunnel, 2000 feet from the tunnel mouth, to open up their ore bodies at depth.

The *Avalanche* says the big deal which was to take place in the Trade Dollar, Black Jack and Boonville groups has been declared off. It is the supposition that the Standard Oil Company was the prospective purchaser.

Fresno.

L. Rabordore on Black creek is reported to have uncovered a 2-foot vein of unusual richness.

Kern.

The Randsburg *Miner* says the shaft on the J. I. C. is down about 270 feet with good indications for the future. The crosscut at the 170-foot level is in 60 feet.

At Randsburg the Little Butte Mining Co. at the depth of 280 feet has ore $471.90 in gold, 14 inches wide.

At Randsburg nearly 200 claims are being worked. The Magganetta drift has been extended 65 feet along the ledge. Small streaks of ore have run nearly the whole distance. The Merced has just shipped another gold brick. There are 30 men working on the Winnie.

Los Angeles.

At Old Baldy there are now about 100 men prospecting on the mountain. The new finds made in the George L. mine attract considerable attention.

The Red Rover at Acton is making another run on its high-grade ore from the 700-foot level.

Madera.

J. B. Peaks and J. C. Wilbur have sold the Syndicate gold property, twelve miles from Raymond, in Madera county, to J. W. Chipman of Indianapolis, who will build a 10 stamp mill, put in a complete electrical plant and run a tunnel to tap the vein 140 feet below the present tunnel. The ore is said to run from $10 to $18 a ton, the vein being 18 feet wide. The mine will be turned over to Mr. Chipman on September 1, at which time he will have returned from New York.

Mariposa.

Oakland men who have developed a property fifteen miles northeast of Mariposa report a rich 5-foot ledge that justifies them in the belief that it will compare favorably with the best strikes of the year in the State; fourteen men are employed, and several thousand dollars are said to be in sight.

(Special Correspondence).—The Merced Gold Mining Company has closed the Malvina mine and is now operating only the Mary Harrison, from which sufficient ore is being taken to keep the 40-stamp mill in operation. About thirty men were thrown out by the closing of the Malvina, of whom about one-half were re-employed at the Mary.

At the Virginia a number of additional men have been put on during the past week.

On the Red Banks properties three shifts are engaged in extending the Daisy tunnel to cut the ledge on the Crown Lead claim of the McCrellish properties. The distance to be run is about 300 feet, which will make the total length of the tunnel about 900 feet. Progress is being made at the rate of 15 to 20 feet weekly.

At the Louisiana the new prospecting mill is running and the work of pumping out the shaft is in progress.

On the Intervenor drifting is in progress both ways from the tunnel. Both faces are in a good quality of milling ore.

The Lucky Bill mine, near the south line of the county and owned by Sheriff R. A. Prouty, under bond to J. B. Peakes and J. S. Wilbur, is sold to Eastern parties for $100,000. So far as opened, the mine shows great value, the vein in the tunnel, which was about 15 feet, had widened to 20 feet at the depth of 20 feet in the winze, and 400 tons of this ore milled in the old Mammoth mill at Grub Gulch yielded a little over $17 per ton. Mr. Prouty retains an interest in the property with the new owners.

The opening of the Sierra railway has been of considerable value to this section. The length of wagon haul has been reduced one-half, the passenger time between Coulterville and San Francisco via Dom Pedro station is now twelve hours, instead of thirty as by the old routes, and a saving is effected in freight rates of about 33 per cent, the latter a very material item to the low-grade mines of this district.

An unusual number of properties in this vicinity have been under examination during the past two weeks, with a good prospect of some extensive operations resulting.

Coulterville, Aug. 17.

Mono.

At the Montecito, Goleta and Sterling twenty men are employed, opening up ground in the Sterling, 150 feet north from the lower tunnel, which extends 1200 feet into the hill, the face being 700 feet vertically below the surface. They are in a body of ore 40 feet wide. The material assays, on an average, $8 per ton.

Nevada.

At the Orleans, Supt. Brockington will put in a new two-drill compressor. A crosscut in the hanging wall is to be run in the No. 8 level and another driven in the footwall to strike the Huston Hill vein. This was very rich in the early days, paying $240,000 in dividends from 1864 to 1869.

The *Union* reports that Buck Bros. of Moore's Flat have struck another quartz ledge with considerable gold at the mouth of New York ravine.

The *Union* says preliminary work for opening up and developing the Diamond mine, recently sold to A. C. Widber, treasurer of San Francisco, has begun. A hoisting and pumping plant will be put on the property. An incline shaft will be sunk several hundred feet in depth. J. Deasy from San Francisco will be superintendent.

Placer.

Sentinel: Two carloads of machinery have arrived at Colfax for the Hidden Treasure Mining Company above Forest Hill. One car contained the dynamo for the $15,000 electric plant and the necessary wire, about 24,000 feet for the circuit. A second car was loaded with 11-inch pipe for the new blower.

Plumas.

National-Bulletin: Eomaldo & Co. have recently tapped the gravel channel. The gold secured is very heavy and lies mainly on the bedrock. Pieces weighing from $5 to $20 are numerous. Two thousand dollars taken from the property was taken to La Porte a few days ago. The mine is now bonded to an English company for $15,000.

F. E. Thomas at the Fairstake mining property, Emigrant Hill, after sinking a shaft reached bedrock and began to drift. The first day's work in taking out and washing gravel gave $50. If plenty of water were to be had at the mine larger returns could be secured.

San Diego.

The Du Quesne Mining Co. has twenty men working on the old Escondido mines day and night.

Capt. W. R. Farnsworth has purchased the North Star mine, an extension of the Ranchita, at Banner.

In the Mesquite district, six miles from Glamis, the Bay Horse reports averaging $25 per ton. M. S. G. Todd of Los Angeles is secretary.

Shasta.

An additional force arrived at Mule mountain last week from Cripple Creek, Colo., to assist in the development of the London Gold Tunnel Company's property. From Sec'y E. W. Sebben the *Searchlight* learns that it is expected the tunnel will be driven 400 feet. It is thought that some small veins will be encountered, besides penetrating the large ledge many feet. An assay from the four ledges already cut gives an average of $21. The fourth contains 5 per cent copper.

Supt. Hanley of the Niagara reports the vein 5 feet wide, carrying $15 free-milling ore and 1 foot of $60 smelting ore. The O'Neil tunnel 2300 feet in length crosscuts the vein, and at that point either electricity or compressed air will be used to aid in sinking upon the ledge. If, on sinking, it is demonstrated that the ledge continues to carry pay to a greater depth, a new tunnel will be run to serve both as main and ultimate working tunnel. This tunnel will be over a mile in length and will tap the ledge at a vertical depth of 1800 feet, or about 900 feet below the O'Neil level.

Sierra.

In the upraise at the Butcher Ranch mine the *Enterprise* reports a vein of ribbon quartz showing well in free gold.

At the Gold Bluff ore is being taken out of the upper levels that will average $6 per ton. The intention is to extract 600 tons before starting the mill.

Siskiyou.

The Lucky Hall has a ledge averaging 16 inches in width, milling from $14 to $20 a ton.

The hydraulic claims on the Klamath have closed down on account of a scarcity of water. It is said that creeks and gulches that had a big supply of water a year ago at this time are almost dry now.

The Siskiyou mine, on the Klamath river, opposite the Bunker Hill mine, is one of the best paying properties in that locality, although it is now closed down, owing to a scarcity of water. It is said that for some time previous to closing down they took out an average of $500 a day.

The Klamath River Flume & Mining Company are employing a large number of men at their property near Happy Camp, and will be ready for operation by the first of next year.

The river mines on the Klamath are about all that can be worked at present, owing to the scarcity of water. They are all busy taking out as much gravel as possible before the storms commence, when they will have to stop work, and when the hydraulic mines can commence.

The Katie May mine on Greenhorn, owned by Bailey & Carrick, will be worked this fall and winter by its owners, who expect to take out a large quantity of quartz.

A 300-foot tunnel was recently run in the Commodore mine, on Barkhouse, by Quigley & Humphreys, and a 5-foot ledge was struck, from which 300 ounces of gold has been taken out.

Jones & Daniels of Quartz valley have bought the Pinkham quartz mine.

The Green Mountain mine in Quartz valley, owned by the Allen brothers, has closed down. The machinery, hoisting works and pump have been taken out.

At Happy Camp, Superintendent Stanley of the Minnetta B. mine, Nolton, has nine men cutting away and piping the top soil to the depth of 60 feet, and will put in an elevator to remove the bottom gravel. The company pay from $2.25 to $3 per day.

Dr. McArdle of Portland has bought the property twenty miles below, owned by Rolls & Co.

The Klamath Flume & Mining Company are surveying the final location of the big ditch.

Mr. Schuler, Scott river, near Scott's Bar, this week showed the *Journal* a nugget he had taken out which measured about 3 inches square and 1 inch thick, comprising gold and tellurium, the gold being valued at $400. He also had several other nuggets varying in size from value of $5 and less. Scott river has been noted for rich nuggets, such finds being of common occurrence during the '50 period, with occasional strikes ever since, besides many rich pockets of quartz.

The miners who took out 117 ounces from a pocket at Ash Creek, Klamath river, nine miles north of Yreka, a short time ago, are still at work realizing good prospects, with the expectation of finding a permanent ledge.

Humphreys & Quigley brought in about $4500 from the Commodore mine, on Barkhouse creek, last week.

Since the recent strikes at Coffee creek, Scott river, Ash creek, Barkhouse and other places, numerous prospectors have started out hunting mines in every section of Siskiyou.

Trinity.

R. R. McCleod, representing San Jose men, has men building a mill on the East Fork of Trinity river, eight miles east of Trinity Center. The company have a large ledge of low-grade rock.

The Strode mine is turning out good rock and milling goes on day and night. It is five miles above Trinity Center.

Coffee creek has been worked for many years by placer miners with varying success. The gravel is very rich; but, owing to the nature of the ground, its extraction has been costly. The Nash Mining Company are working on an extensive scale at the head of Coffee creek and are having good success in their gravel mines. D. Duncan, working on Hickory gulch, recently made a discovery of decomposed quartz, 300 feet wide, which will yield from $25 to $30 to the pan. This gulch is a tributary of main Coffee creek.

A carload of machinery, including a large horizontal boiler, hoisting machinery and wire cable, has arrived for the Altoona Quicksilver Mining Company at Cinnabar.

The *Journal* reports that the Cle Fse Company at Junction City are making preparations to work the Keno and Pickett mines the coming season. They have dug trenches and will lay 6000 feet of iron pipe to convey water from the bluff to the mines. The work will be completed this fall.

Good reports come from the new finds on Coffee creek. There are a large number of visitors and prospectors going into the country.

J. H. Carroll from Coffee creek tells the *Searchlight* that he and J. A. Riley were the original locators of the vein from which Burgess and Murphy took out twelve ounces in one day last week. It was reported that they took out $80,000, mentioned only to show the unreliability of reports circulated by space writers on city dailies. The total taken out up to last Sunday by these miners, when Mr. Carroll left the creek, was about $1200. Carroll and Riley sold their claim to Pitts and Manning of Oro Fino. The Burgess & Murphy mine is an east extension, while D. Donovan has a promising claim on the west extension.

Tuolumne.

In the Rawhide mine they struck the ledge on the 1100-foot level. The Rawhide is credited with a July yield of $250,000.

The Dutch Mining Company will soon put up a brick building 30x40, the first brick building in Quartz Mountain.

The Andy Johnson will be started this week. At the Helena, one and a half miles below Stent, a tunnel has been run 100 feet on the lode and crosscutting begun. The three compartment shaft on the Trio is now down 73 feet. At shaft No 1 drifting on the ledge is being carried ahead. At the Golden Rule the drift on the 300-foot level shows free gold in the quartz. The other drifts being driven are all in good pay rock. A station is being cut on the 300-level of the Alabama. A mill will soon be built.

The Excelsior, 15 miles from Sonora, is to be reopened. Supt. Ogden of the Providence hopes to soon be able to start a 3-compartment shaft 300 ft. north of the present tunnel and build a 20-stamp mill. At the Lady Washington the mill has proven a failure. Supt. Fisher will put up a 5-stamp mill. Supt. Jose has resumed work on the Green. Supt. Summers has begun sinking a shaft on the North Carlotta.

(Special Correspondene).—The old Soulsby will start up as soon as the rain comes. The mine was closed down on the first of June, the last shots put in the night before showed up the vein 14 inches wide with visible gold all through the ore. The mine in its past has taken out over $3,000,000 from the old Soulsby shoot, 1200 feet north of the present Pennsylvania shaft.

NEVADA.

Near Silver City a gold brick weighing four pounds, worth $12.86 per ounce, was produced last week from the Cosmopolitan mine on the 100-foot level.

The National Nickel Company in Cottonwood have started their electric plant on ore averaging 15 per cent nickel. Forty tons of machinery and mining implements are in the freight depot at Lovelock.

Seven carloads of machinery, billed to the Chainman Company, have arrived in Eureka.

McDonald and Rice, from El Dorado canyon, Lincoln county, say the largest bodies of ore ever found in southern Nevada are now opened up in the Techaticup and Wall Street mines, owned by the Southwestern Mining Company. One of the ledges shows a 50-foot breast of ore that will mill $20 per ton in gold. In another ledge an 8-foot body of ore runs over five ounces in gold to the ton. Charles Gracey, the new superintendent, has opened the two mines in excellent shape and has enough ore in sight to keep the 15-stamp mill pounding away for five years. The June output of the mill was $15,000.

At Carson this week, in the United States Circuit Court, Judge Hawley in the case of A. Garrard against the Silver Peak mines, an action in ejectment to recover from the Silver Peak mines lands in Esmeralda county, with mill tailings, found for the defendants. Defendants had been using the land since June, 1895. A mill and other improvements had been built by the defendants to the value of $120,000. The contention arose through a mistake of the Surveyor-General of Nevada at the time the land was taken up. The land should have been in plat 22, but by the error it was recorded as in 58. Garrard, who was a surveyor, together with others, then attempted to get the land. The court decided that the State had no title to the lands under the 2,000,000-acre grant, this land being of a salt or saline character and exempt from grant.

John Mackay had arranged to take the mine in case the defendant won the suit, and his representatives, Womble and Roberts, are to assume charge. The mine is in the southern part of Esmeralda county.

OREGON.

There are twenty men on Silver creek, Josephine county, some making $10 a day; there is still considerable unprospected ground in that district.

The quartz mill on the Golden Fleece mine, Talent, was destroyed by fire last week; loss $3000, no insurance.

At Pleasant creek there are four hydraulics rigged. Calvert & Stevens are to put on an 11-inch and No. 2 giant. Chaney & Ruefly have an 11-inch pipe and No. 2 giant. G. Leason has an 8-inch pipe and No. 1 giant.

Borden & Howell, Evans creek, are taking a twelve-mile ditch from Evans creek and expect to be working thirty men in a short time.

The Red Boy mine, Baker county, last week cleaned up $12,000. But six tons of ore are crushed daily. It is intended to increase the milling capacity.

C. S. Rutter of Spokane has been appointed receiver of the Bonanza mine, Baker county, pending the settlement of differences arising out of the distribution of the proceeds of the sale of the mine, which took place recently, for $750,000.

The Seven Devils Anaconda Copper Company has incorporated at Baker City; capital stock, $1,000,000; M. Fuchs, A. E. Beard, C. F. Hyde.

The Prescott *Courier* reports the sale of the Fuller group of mines, on Squaw creek, Yavapai county, to Mr. Reeves of Denver and Mr. Thurston of New York for $35,000.

WASHINGTON.

Flodin & Morrison this week sold their mine on Cougar gulch, Swauk district, for $40,000. The incorporation was known as the Cougar M. & M. Company. The purchaser is Frederick Hagerman. He will build hoisting works within three months and erect a stamp mill inside of six months. The ore has been handled by arastras.

BRITISH COLUMBIA.

At a meeting of the Cariboo Mining Company, Camp McKinney, held recently in Spokane, Manager Monahan made the following

statement regarding the operations of the company during the past year: During the past twelve months there has been 6742 tons of ore milled, producing 8035 ounces of bullion and 170 tons of concentrates; the ore milled has averaged $17.45 per ton. There has been 855 feet of drifting on ore and 100 feet of raising on ore; 200 feet development crosscutting; 175 feet development shafting; 50 feet development winze sinking, making 425 feet of developing. The company has recently put in a lot of new machinery, and the mine is now thoroughly equipped in every respect. Since operations were first commenced $156,964.76 has been paid in dividends.

Rossland reports that its mines are producing double the quantity of ore that they were seven months ago, and there are more men working underground than ever before. The force at the Le Roi is nearly double of what it was one year ago, and Supt. Hall says he has still room for thirty more first-class machine-men.

At New Denver apprehension is felt for that silver-producing camp since the decline of the white metal. The general opinion seems to be that, if the price of silver remains low, the Slocan will experience a repetition of the panicky days of 1892-93. No evidence is yet given by the large working mines that they have considered the matter in a serious light, and work is progressing as usual.

Secretary Liftchild of the Poorman mine of Rossland gives the following statement regarding the expenses and receipts since its reorganization—January 1, 1896, to July 15, 1897: Receipts—Returns from ore shipments, $5489.52; assessment No. 1, $4864.92; total, $10,354.42. Expenses—Mining account, $6895.67; general expenses, including organization and 1897 license, $652.22; office expenses, $511.22; assaying account, $239.50; hauling account, $602.48; cash on hand, $1453.33; total, $10,354.42.

James Breen, manager of the Le Roi smelter, tells the Rossland *Miner* that one of the principal reasons for selecting Northport, Wash., as the site of the smelter was that, in the operation of a smelter of 300 tons capacity, it will require approximately forty tons of limestone daily to flux the excess of silica contained in the Le Roi ore. This limestone now costs the B. C. S. & R. Company, whose smelter is located on the Columbia river at Trail, $3.50 per ton. The Le Roi Company at Northport can deliver a superior quality of limestone to any found in Kootenay in their works for 25 cents a ton, saving approximately $50,000 a year in this item alone. They can lay down coke in Northport for $2.50 per ton less than in Trail; and, using about forty-five tons of coke per day, makes a saving in this item of $45,000 per year. They will also save $1.50 per ton on coal—twenty tons per day, making a saving of $10,000 a year. The cost of the plant will be reduced 25 per cent by reason of cheaper building material and freight rates, without considering the innumerable articles entering into the construction of a smelter which have to pay duty notwithstanding that the machinery comes into Canada duty free. On renewals and repairs there will be a monthly expense of $2500, on which there will be a saving of $2.50 per ton in freight and 30 per cent in duties as against any point on the Canada side of the line. The saving in this item will approximate $15,000 per year. They will save $1.50 per ton on outgoing freight. On a basis of twenty tons per day this will amount to $15,000 per year. These items represent roughly a saving of $150,000 per year, or $1.50 per ton of ore smelted. The erection of the Northport plant secures a freight rate on ore of 75 cents per ton instead of $2, as heretofore charged.

A Nelson dispatch says the reverbatory furnace of the Hall mines smelter has closed down for repairs. The furnace now idle, No. 1, will be converted into a lead furnace. On the 11th the new smelter turned out 496,000 pounds of ore, 39,500 pounds of lime rock and 34 tons of coke. Add to this charge 19¼ tons of refining slag and 25 tons of blast furnace slag, and 321¼ tons were smelted.

ALASKA.

Thousands of senseless people, ignorant of where they are going, are still heading for the Klondike. There will be appalling accounts of suffering and death in horrible form from all along the route before long. This journal tried to stem the silly tide by publishing the truth, but those whose imaginations were inflamed by reading the countless columns of rot spread all over the country would see nothing but that which their fancy created.

Regarding the geology of that region, Prof. Lindemann, who explored the upper Yukon in 1871 and 1873, says that "the mineral zone extends east and west, instead of northeast to southwest. The formations are of an earlier period in the earth's history than are those familiar with the limits of the United States proper. I noticed five different strata, the upper and thinnest one being 30 feet thick.

"I think that the entire country is mineral territory, and the entire Alaskan range gold-bearing, the placers being found on every stream leading from the range on either side. The ledges are of tremendous width, but the gold-bearing rock is of low grade and cannot be profitably worked without the aid of capital.

"The geological formation where gold is found is a black slate of the Carboniferous age. I found there also a lime, a quartz and a quartzite, but no ashen granite. I found a granite about 236 miles west of Cook's inlet, and I found hematite 130 miles northeast of the Alaskan range.
